Herenpon a council was summoned, and after long debates the ambassadors were called in; and Scipio Africanus being desired by the consul to acquaint the deputies with the resolutions of the assembly, is said to have expressed himself in the following terms: "We are sensible that the victory which we have lately gained is owing to the gods, and therefore shall treat the vanquished with moderation, demanding little more of them now than we did at our first entering into Asia. Antiochus shall obtain a peace upon the following terms: That he give up his pretensions to Europe, confine his dominions to Asia beyond Mount Taurus; and that he pay 15,000 Euboeic talents for the expences of the war; 500 down, 2500 when the senate and people shall confirm the articles, and 1000 more every year for 12 years together. We also insist upon his satisfying king Eumenes, and his paying him the 400 talents he owes him, and what remains due for the corn which his father sent to the king of Syria. It is likewise the pleasure of the council that you deliver up to us Hannibal the Carthaginian, Thœs the Ætolian, Mnesilochus the Acarnanian, and Philo and Eubulus two Chalcidians; for these have been the authors of our divisions, the incendiaries who kindled the present war. Lastly, the king of Syria, for a further proof of his sincerity, shall give us 20 such hostages as we shall choofe, of whom Antiochus his youngest son shall be one."

terms.

37.ia.

The ambassadors of Antiochus had been ordered to refuse no terms; and therefore these were accepted, and the whole affair concluded. So that the Syrian ambassadors now prepared to set out for Rome, to get the conditions of peace proposed by Scipio ratified there. In the mean time, the consul dividing his army into three hodies, put it into winter-quarters; one part continued at Manesia, another was sent to Trallis, and the third to Ephesus, where the Scipios took up their quarters. There they received a new embassy from Antiochus, with the hostages he had promised, the Roman prisoners and deserters, and the strangers which the consul had demanded, except Hannibal, who after the king's defeat had fled out of his dominions; and Thoas the Ætolian, who, as soon as he heard that a treaty was on foot between Antiochus and the Romans, had returned to Ætolia, where a war was likely to break out between that republic and Rome. L. Aurelius Cotta was sent with the ambassadors to Rome, to acquaint the senate with the particulars of the treaty. When they appeared before the conscript fathers, they spoke with great submission, and only desired them to ratify the articles which the Scipios had offered to their master. The senate, after examining them, ordered that a treaty of peace should be concluded with Antiochus, and the articles of it engraved on brass, and fixed up in the Capitol. They only added one clause, which was, That the Syrians should change every year all their hostages, except the son of king Antiochus, who should continue at Rome as long as the republic thought fit. The peace being thus ratified, and all Asia on this side Mount Taurus delivered into the hands of the Romans, the Greek cities were by them restored to their liberty, the provinces of Caria and Lydia given to the Rhodians, and all the rest that had belonged to Antiochus bestowed upon Eumenes.

38
His death.

Antiochus did not long survive his misfortune at Magnesia. Some tell us, that being greatly puzzled how to raise the sum he had engaged to pay to the Romans, he seized on the riches which had for many ages been deposited in a temple of Jupiter Belus in the province of Elymais; upon which the populace rose in arms, and slew him and all his attendants. Others inform us, that he was killed at an entertainment by one of his guests.

Antiochus the Great died in 187, and with him the glory of the Syrian empire. The Romans now gave laws to the kings of Syria, insomuch, that when Antiochus Epiphanes the grandson of Antiochus the Great hesitated at obeying the commands of the senate, one of the ambassadors drew a circle round him with a rod on the floor, and told him that he should not go out of that spot before he had told him what he was to do. The most remarkable transactions of this prince are his wars with the Jews, and persecutions of them; of which a full account is given under the article JEWS. After a variety of usurpers and tyrants, the kingdom of Syria fell under Tigranes king of Armenia in the year 83 B. C.; and upon his overthrow by the Romans, it became a province of the dominions of the republic. From them it was taken by the Saracens in the reign of the caliph Omar, and is now a province of Turkey in Asia.

39
Syria becomes a Roman province.

Syria is in some measure only a chain of mountains, varying in their levels, situation, and appearances. The part of the country, however, next the sea is in general low, and besides this there are several extensive valleys. The climate on the sea-coast and in these valleys is very hot, but in the higher parts of the country it bears a good deal of resemblance to that of France. Syria is exceedingly fertile, and the variety of its productions is very great. Besides wheat, rye, barley, beans, and the cotton plant, which is cultivated everywhere, Palestine abounds in sesamum, from which oil is procured, and doura as good as that of Egypt.

40
Climate, soil &c. of the country.

Maize thrives in the light soil of Balbec, and even rice is cultivated with success on the borders of the marshy country of Havula. They have lately begun to plant sugar-canes in the gardens of Saide and of Bairout, and they find them equal to those of the Delta. Indigo grows without cultivating on the banks of the Jordan, in the country of Bitan, and only requires care to make it of an excellent quality. The hill-sides of Latakia produce tobacco. Gaza produces dates like Mecca, and pomegranates like Algiers; Tripoli affords oranges equal to those of Malta; Bairout figs like those of Marseilles, and bananas not inferior to those of St Domingo; Aleppo enjoys the exclusive advantage of producing pistachios; and Damascus justly boasts of possessing all the fruits known in our provinces. Its stony soil suits equally the apples of Normandy, the plums of Touraine, and the peaches of Paris. Twenty sorts of apricots are reckoned there, the stone of one of which contains a kernel highly valued through all Turkey. The cochineal plant, which grows on all that coast, contains perhaps that precious insect in as high perfection as it is found in Mexico and St Domingo.

Fol. 1
vol.

The inhabitants may be divided into three principal classes: the descendants of the Greeks of the Lower Empire; the Arabs, their conquerors; and the Turks, the present ruling power: and these again, the first into three, the second into four, classes; besides three wandering tribes of Turkomen, Curds, and Bedouin Arabs. The ancient inhabitants before the Greeks under Alexander are entirely lost. The inhabitants are in general of a middling stature, and the eyes of the women almost everywhere beautiful, and their shape correct and well proportioned. The general language is Arabic. Syriac is a dead language.

SYRINGA, the LILAC, in botany: A genus of plants belonging to the class of *diandria*, and order of *monogynia*; and in the natural system ranging under the 44th order, *Septimia*. The corolla is quadricid, and the capsule is bicellular. There are three species, the *vulgaris*, *persica*, and *suspensa*. The two first are natives of Persia, and the last of Japan.—The *vulgaris*, which is distinguished by ovate heart-shaped leaves, was cultivated in Britain about the year 1597 by Mr John Gerard.—The *persica*, which has lanceolate leaves, was cultivated in 1658; but how long both species might have been introduced into Britain before these dates, it is perhaps impossible to ascertain.

SYRINGE, a well-known instrument, serving to imbibe or suck in a quantity of fluid, and to squirt or expel the same with violence. The word is formed from the Greek *σφύριξ*, or the Latin *styrinx* "a pipe."—A syringe is only a single pump, and the water ascends in it on the same principle as in the common sucking-pump. See HYDROSTATICS, n^o 25, *et seq.*

SYRUP, in pharmacy, a saturated solution of sugar, made in vegetable decoctions or infusions. See PHARMACY, ch. xxiii.

SYSTEM, in general, denotes an assemblage or chain of principles and conclusions, or the whole of any doctrine, the several parts whereof are bound together, and follow or depend on each other; in which sense we say a *system of philosophy*, a *system of divinity*, &c. The word is formed from the Greek *συστημα* "composition, compages."

SYSTEM, in the animal economy, the *vascular*, the *nervous*, and the *cellular*. See ANATOMY.

SYSTEM, in music, an assemblage of the rules for harmony, deduced from some common principle by which they are reunited; by which their connection one with another is formed; from whence, as from their genuine source, they natively flow; and to which, if we would account for them, we must have recourse. See the articles CHROMATIC, DIA-

ent. TONIC, ENHARMONIC, HARMONY, INTERVAL, and MUSIC.

SYSTEM, in botany. See BOTANY, page 430.

SYSTEM, in astronomy. See ASTRONOMY.

SYSTOLE, in anatomy, the contraction of the heart, whereby the blood is drawn off its ventricles into the arteries; the opposite state to which is called the *diastole*, or dilatation of the heart. See ANATOMY, n^o 124.

SYSTYLE, in architecture, that manner of placing co-

lumns where the space between the two shafts consists of two diameters or four modules. Syzzy.

SYZYGY, SYZYGIA, in astronomy, a term equally used for the conjunction and opposition of a planet with the sun. The word is formed from the Greek *συζυγία*, which properly signifies *conjunctio*. On the phenomena and circumstances of the syzygies a great part of the lunar theory depends. See ASTRONOMY.

T.

T or t, the 19th letter and 16th consonant of our alphabet; the sound whereof is formed by a strong expulsion of the breath through the mouth, upon a sudden drawing back of the tongue from the fore-part of the palate, with the lips at the same time open. The proper sound of *t* is expressed in most words beginning or ending with that letter; as in *take, tell, hot, put*. *Ti* before a vowel has the sound of *fi*, or rather of *shi*, as in *creation*, except when *f* precedes, as in *question*; and in derivatives from words ending in *ty*, as, *mighty, mightier*. *Th* has two sounds; the one soft, as *thou, father*; the other hard, as *thing, think*. The sound is soft in these words, *then, thence, and there*, with their derivatives and compounds; and in the words *that, this, thus, thy, they, though*; and in all words in which *th* comes between two vowels, as, *whether, rather*; and between *r* and a vowel, as *burthen*.

In abbreviations, amongst the Roman writers, T. stands for *Titus, Titius*, &c.; Tab. for *Tabularius*; Tab. P. H. C. *Tabularius Provinciae Hispaniae Citerioris*; Tar. *Tarquinius*; Ti. *Tiberius*; Ti. F. *Tiberii filius*; Ti. L. *Tiberii libertus*; Ti. N. *Tiberii Nepos*; T. J. A. V. P. V. D. *tempore judicem arbitrumque postulat ut det*; T. M. P. *terminum posuit*; T. M. D. D. *terminum dedicavit*; Tr. *trans, tribunus*; Tr. M. or Mil. *tribunus militum*; TR. PL. DES. *tribunus plebis designatus*; TR. AER. *tribunus aeriarii*; TRV. CAP. *triumviri capitales*; T. P. or TRIB. POT. *tribunicia potestate*; Tul. H. *Tullus Hostilius*.

Amongst the ancients, T. as a numeral, stood for *one hundred and sixty*; and with a dash at top, T̄, it signified *one hundred and sixty thousand*. In music, T̄ stands for *tutti*, "all, or altogether."

TABANUS, the BREEZE-FLY: a genus of insects belonging to the order of *diptera*. The mouth is extended in a fleshy proboscis, terminated by two lips. The rostrum is furnished with two pointed palpi placed on each side of the proboscis, and parallel to it. Gmelin has enumerated 38 species; of which three only are found in Great Britain, the *bovinus*, *pluviatilis*, and *cæcutiens*.

1. The *bovinus*, or great horse fly, has a grey head; the eyes almost of a black brown, occupying the greatest part of it. The thorax is of a grey colour; the abdomen is yellowish, with a triangular white spot on the middle of every ring, which constitutes a longitudinal band of spots, the point of which is directed towards the thorax. The thighs are blackish, and the legs yellow. The wings are somewhat dusky, with brown veins of a deeper dye. This insect is the terror of horned cattle, horses, &c. Its mouth is armed with two sharp hooks which penetrate their hide; while with its proboscis, which is shaped like a sting, it sucks their blood, of which it is very greedy. The puncture of the tabanus is keen and painful. The insect is very common in damp woods and meadows, especially during the great heats, when it is most troublesome. The horned cat-

tle are sometimes so molested by their stings, that they go mad, run down precipices, tear themselves on the stumps of trees, stones, &c. Tabarca. Tabasheer.

2. The *pluviatilis* is of an ashen grey colour; its eyes are green, with brown streaks. The thorax is brown, marked with about seven longitudinal grey lines; the wings, which are brown and ash-coloured, are dotted over with small white spots, and have a black spot on the margin; the legs are surrounded with brown and white rings alternately. This species is very common in meadows, and is about four lines in length.

3. The *cæcutiens* has a brown head; eyes green and brown, with black spots; the thorax brown with black spots; the abdomen above, yellow with triangular brown spots; yellow legs, and white wings with black and brown spots. The length is four lines and a half.

TABARCA, a little island lying opposite to a small town of that name, which divides the maritime coasts of Tunis and Aigiers, in Africa, two miles from the land, in possession of the noble family of the Lamellini of Genoa, who have here a governor and a garrison of 200 men to protect the coral fishery. N. Lat. 36. 50 E. Long. 9. 16.

TABASHEER, a Persian word, signifying a hard substance found in the cavities of the bamboo or Indian reed, and highly valued as a medicine in the East Indies. Though some account was given of the tabasheer by the Arabian physicians, no accurate knowledge of it was obtained till Dr Ruffel favoured the public with his observations on it.

According to this gentleman's information, the tabasheer is produced from the female bamboo, which is distinguished from the male by the largeness of its cavity. It is easy to discover, without opening them, what bamboos contain it, as they make a rattling noise when shaken. Dr Ruffel having examined a bamboo brought from Vellore, consisting of six joints, found no appearance of tabasheer in two of them: all the rest contained some, but of various quality and quantity; the whole amounting to about 27 grains. The best was of a bluish white resembling small fragments of shells, harder also than the rest, but which might be easily crumbled between the fingers into a gritty powder; and when applied to the tongue and palate, had a slight saline and testaceous taste; the weight not exceeding four grains. The colour of the rest was cineritious, rough on the surface, and more friable; having some particles of a larger size intermixed, but light, spongy, and somewhat resembling pumice stones; which appearance, our author supposes, led the Arabians to think that fire was concerned in the production. The two middle joints were of a pure white colour within, and lined with a thin film. In these the tabasheer was principally found. The other joints, particularly the two upper ones, were discoloured within; and in some parts of the cavity was found a blackish substance in grains or in powder, adhering to the sides, the film being there obliterated.

Tabasheer
||
Taber-
nacle.

In two or three of the joints a small round hole was found at top and bottom, which seemed to have been perforated by some insect.

Gazius informs us, that it is not found in all bamboos, nor in all the branches indifferently, but only in those growing about Bisnagur, Batecala, and one part of the Malabar coast. Dr Ruffel was informed by a letter from a medical gentleman attending the embassy to the Nizam, that though tabasheer bears a high price at Hyderabad, it is never brought thither from Bisnagur; and that some of what is sold in the markets comes from the pass of Ateour in Canoul; and some from Emnabad, at the distance of about 80 miles to the north west; but that the most part comes from Masulipatam. That sold in the markets is of two kinds; one the rate of a rupee *per dram*, but the other only half that price; the latter, however, is supposed to be factitious, and made up mostly of burnt teeth and bones. Dr Ruffel himself also, is persuaded that the tabasheer met with in commerce is greatly adulterated. The above-mentioned gentleman likewise informed the doctor that tabasheer was produced in great quantities at Sylhat, where it is sold by the pound, from one rupee to one and an half; forming a considerable article of trade from Bengal to Persia and Arabia. There is, however, a third kind, much superior to either of the two above described; differing not only in its superior whiteness, but likewise in being much less mixed with heterogeneous particles; being likewise much harder, heavier, and scarcely in any degree liable by the finger.

From the experiments of Dr Ruffel, it appears that the tabasheer is the juice of the bamboo thickened and hardened to a certain degree. Its chemical qualities, as far as we have heard, have not yet been minutely examined. The following observations on its medical effects were taken from a Persian work, intitled the "Tosut ul Moncin of Mahommed Moncin Hofsiny," by Mr Williams, a surgeon in the service of the East India company. The tabasheer puts a stop to bilious vomitings and to the bloody flux. It is also of service in cases of palpitation of the heart, in faintings, and for strengthening those members of the body that are weakened by heat. It is useful also for the piles, and for acute or burning fevers, and for pustules in the mouth (thrush); and, given with oxymel, is of service against restlessness, melancholy, and hypochondriacal affections. The habitual internal use of it is prejudicial to the virile powers. It is also said to be prejudicial to the lungs. Its correctives are the gum of the pine and honey. The dose of it is to the weight of two drachems, or seven māsās.

TABBY, in commerce, a kind of rich silk which has undergone the operation of tabbying.

TABBYING, the passing a silk or stuff under a calendar, the rolls of which are made of iron or copper variously engraved, which bearing unequally on the stuff renders the surface thereof unequal, so as to reflect the rays of light differently, making the representation of waves thereon.

TABELLIO, in the Roman law, an officer or scrivener, much the same with our notaries-public, who are often called *tabelliones*.

TABERNACLE, among the Hebrews, a kind of building, in the form of a tent, set up, by express command of God, for the performance of religious worship, sacrifices, &c. during the journeying of the Israelites in the wilderness; and, after their settlement in the land of Canaan, made use of for the same purpose till the building of the temple of Jerusalem. It was divided into two parts; the one covered, and properly called the *tabernacle*; and the other open, called the *court*. The curtains which covered the tabernacle were made of linen, of several colours, embroidered. There were

ten curtains, twenty eight cubits long and four in breadth. Five curtains fastened together made up two coverings, which covered up all the tabernacle. Over these there were two other coverings; the one of goat's hair, the other of sheep's skins. The holy of holies was parted from the rest of the tabernacle by a curtain made fast to four pillars, standing ten cubits from the end. The length of the whole tabernacle was 32 cubits, that is, about 50 feet; and the breadth 12 cubits, or 19 feet. The court was a spot of ground 100 cubits long, and 50 in breadth, enclosed by 20 columns, each 20 cubits high and 10 in breadth, covered with silver, and standing on copper bases, five cubits distant from one another; between which there were curtains drawn, and fastened with hooks. At the east end was an entrance, 20 cubits wide, covered with a curtain hanging loose.

Fest of TABERNACLES, a solemn festival of the Hebrews, observed after harvest, on the 15th day of the month Tisri, instituted to commemorate the goodness of God, who protected the Israelites in the wilderness, and made them dwell in booths, when they came out of Egypt. On the first day of the feast, they began to erect booths of the boughs of trees, and in these they were obliged to continue seven days. The booths were placed in the open air, and were not to be covered with cloths, nor made too close by the thickness of the boughs; but so loose that the sun and the stars might be seen, and the rain descend through them. For further particulars of the celebration of this festival, see LEVIT. ch. xxiii.

TABERNÆ (anc. geog.) See *TRES Tabernæ*.

TABERNÆMONTANA, in botany: A genus of plants belonging to the class of *pentandra*, and order of *monogynia*; and in the natural system arranged under the 30th order, *Centrose*. There are two horizontal foliols, and the seeds are immersed in pulp. There are eight species, all of foreign growth.

TABLE, a moveable piece of furniture, usually made of wood or stone, and supported on pillars or the like, for the commodious reception of things placed thereon.

TABLE is also used for the fare or entertainment served up.

TABLE, in mathematics, systems of numbers calculated to be ready at hand for the expediting astronomical, geometrical, and other operations.

TABLE-Book. See WRITING.

TABLE-Mountain, a mountain of Africa, being the most westerly cape or promontory in that part of the world, and near the Cape of Good Hope. The bay which is formed thereby is called the *Table-bay*.

Laws of the Twelve TABLES, were the first set of laws of the Romans; thus called either because the Romans then wrote with a style on thin wooden tablets covered with wax; or rather, because they were engraved on tables or plates of copper, to be exposed in the most noted part of the public forum. After the expulsion of the kings, as the Romans were then without any fixed or certain system of law, at least had none ample enough to take in the various cases that might fall between particular persons, it was resolved to adopt the best and wisest laws of the Greeks. One Hermodorus was first appointed to translate them, and the decemviri afterwards compiled and reduced them into ten tables. After a world of care and application, they were at length enacted and confirmed by the senate and an assembly of the people, in the year of Rome 303. The following year they found something wanting therein, which they supplied from the laws of the former kings of Rome, and from certain customs which long use had authorized: all these being engraven on two other tables, made the law of the twelve tables, so famous in the Roman jurisprudence, the source and foundation of the civil or Roman law.

Tables of the Law, in Jewish antiquity, two tables on which were written the decalogue, or ten commandments, given by God to Moses on mount Sinai.

TABOO, a word used by the South Sea Islanders, nearly of the same import as prohibited or interdicted. It applies equally to persons and things, and is also expressive of any thing sacred, devoted, or eminent.

TABOR, a mountain of Galilee, about 12 miles from the city of Tiberias. It rises in the form of a sugar-loaf, in the midst of an extensive plain, to the height of 30 stadia, according to Josephus. The ascent is so easy, that one may ascend on horseback. On the top there is a plain two miles in circumference.

The situation of Mount Tabor is most delightful. Rising amidst the plains of Galilee, it exhibits to the enchanted eye a charming variety of prospects. On one side there are lakes, rivers, and a part of the Mediterranean; and on the other a chain of little hills, with small valleys, shaded by natural groves, and enriched by the hands of the husbandmen with a great number of useful productions. Here you behold an immensity of plains interspersed with hamlets, fortresses, and heaps of ruins; and there the eye delights to wander over the fields of Jezrael or Mageddon, named by the Arabs *Ebn-Amer*, which signifies "the field of the sons of Aamer." A little farther you distinguish the mountains of Hermon, Gilboa, Samaria, and Arabia the Stony. In short, you experience all those sensations which are produced by a mixture and rapid succession of rural, gay, gloomy, and majestic objects.

It was upon this enchanting mount that the apostle Peter said to Christ, "It is good for us to be here: and let us make three tabernacles; one for thee, and one for Moses, and one for Elias."

Flavian Josephus, governor of Galilee, caused the summit of this mountain, for the space of two miles and a half, to be surrounded with walls. The inhabitants of Tabor long braved the power of the Roman armies; but being deprived of water in consequence of the great heats, they were forced to surrender at discretion to Placidus, the general of Vespasian.

Several churches were built upon this mountain by St. Helen, who founded here also some monasteries. Of the two most remarkable, one was dedicated to Moses, and inhabited by Cenobites of the order of St. Benedict, who followed the Latin rites: the other was dedicated to the prophet Elias by monks of the order of St. Basil, attached to the Greek rites. The kings of Hungary erected here also a pretty spacious convent for some monks belonging to that nation, of the order of St. Paul the first hermit. Tabor was also the seat of a bishop, dependant on the patriarchate of Jerusalem.

When Godfrey of Bouillon seized on this mountain, he repaired the ancient churches, which were beginning to fall into ruins. Under Baldwin I. in 1113, the Saracen troops retook Tabor; and their sanguinary fury gained as many victories as there were priests and Cenobites. This mountain again fell into the hands of the Christians; but the Catholic standard was not long displayed on it. Saladin pulled it down the year following, and destroyed all the churches. The Christians retook it once more in 1253; and their zeal made them rebuild all the sacred places. At this time Rome being accustomed to give away empires, Pope Alexander IV. granted Tabor to the Templars, who fortified it again. At length, in the course of the year 1290, the sultan of Egypt destroyed and laid waste the buildings of this mountain, which could never be repaired afterwards; so that at present it is uninhabited.

TACAMAHACA, in pharmacy, a solid resin, impro-

perly called a *gum* in the shops. It exudes from a species of poplar; and is in repute for mitigating pain and aches, and is also reckoned a vulnerary.

TACCA, in botany: A genus of plants belonging to the class of *dodecandria*, and order of *trigynia*. The flower is above. The corolla has six petals, and is vaulted. The calyx is hexaphyllous; the fruit a dry, angular, three-celled berry. There is only one species known, the *pinna-tifida*.

TACITUS (Caius Cornelius), a celebrated Roman historian, and one of the greatest men of his time, appears to have been born about the year of Rome 809 or 810, and applied himself early to the labours of the bar, in which he gained very considerable reputation. Having married the daughter of *Agricola*, the road to public honours was laid open to him in the reign of Vespasian; but during the sanguinary and capricious tyranny of Domitian, he, as well as his friend Pliny, appears to have retired from the theatre of public affairs. The reign of Nerva restored these luminaries of Roman literature to the metropolis, and we find Tacitus engaged, in the year 850, to pronounce the funeral oration of the venerable *Virginus Rufus*, the colleague of the emperor in the consulship, and afterwards succeeding him as consul for the remainder of the year.

The time of his death is not mentioned by any ancient author, but it is probable that he died in the reign of Trajan.

His works which still remain are, 1. Five books of his History. 2. His Annals. 3. A Treatise on the different Nations which in his time inhabited Germany: and, 4. The Life of *Agricola* his father-in-law. There is also attributed to him a Treatise on Eloquence, which others have ascribed to *Quintilian*. The Treatise on the Manners of the Germans was published in 851.— In the year 853, Pliny and Tacitus were appointed by the senate to plead the cause of the oppressed Africans against *Marius Priscus*, a corrupt proconsul, who was convicted before the fathers; and the patriot orators were honoured with a declaration that they had executed their trust to the entire satisfaction of the house. The exact time when Tacitus published his history is uncertain, but it was in some period of Trajan's reign, who died suddenly, A. U. C. 870, A. D. 117.— The history comprises a period of 27 years, from the accession of Galba, 822, to the death of Domitian, 829. The history being finished, he did not think he had completed the tabular of slavery; he went back to the time of *Liberius*: and the second work, which, however, comes first in the order of chronology, includes a period of 54 years, from the accession of *Tiberius*, 767, to the death of *Nero*, 821: this work is his "Annals."

It is remarkable, that princes and politicians have always held the works of Tacitus in the highest esteem; which look as if they either found their account in reading them, or were pleased to find courts, and the people who live in them, so exactly described after the life as they are in his writings. Part of what is extant was found in Germany by a receiver of Pope Leo X. and published by *Beroaldus* at Rome in 1515. Leo was so much charmed with Tacitus, that he gave the receiver a reward of 500 crowns; and promised not only indulgences, but money also and honour, to any one who should find the other part; which it is said was afterwards brought to him. Pope Paul III. as *Muretus* relates, wore out his Tacitus by much reading; it; and *Cosmo de Medicis*, who was the first great duke of Tuscany, and formed for governing, accounted the reading of him his greatest pleasure. *Muretus* adds, that several princes, and privy-counsellors to princes read him with great application, and regarded him as a sort of oracle in politics. A certain author relates, that Queen Christina of Sweden,

Tacitus. Sweden, though extremely fond of the Greek tongue, which she made "the diversion of her leisure hours, was not restrained by that from her serious studies; so she called among others Tacitus's History, some pages of which she read constantly every day." Lastly, our late Lord Bolingbroke, an authority surely of no mean rank, calls him, "a favourite author," and gives him manifestly the preference to all the Greek and Roman historians.

Bailet Vie de Des Cartes, tom. II. Study of History, Letter V.

No author has obtained a more splendid reputation than Tacitus. He has been accounted, and with good reason, the most cultivated genius of antiquity; and we must not seek for his parallel in modern times. It is impossible not to admire and recommend his intimate knowledge of the human heart, the spirit of liberty which he breathes, and the force and vivacity with which he perpetually expresses himself. The reader of taste is struck by the greatness of his thoughts and the dignity of his narration; the philosopher by the comprehensive powers of his mind; and the politician by the sagacity with which he unfolds the springs of the most secret transactions. Civil liberty and the rights of mankind never met with a bolder or a more able asserter; servitude, debasement, and tyranny, appear not in the writings of any other author in juster or more odious colours. He has been censured as obscure; and indeed nothing can be more certain than that he did not write for the common mass of men. But to those who are judges of his compositions, it is no matter of regret that his manner is his own, and peculiar. Never were description and sentiment so wonderfully and so beautifully blended; and never were the actions and characters of men delineated with so much strength and precision. He has all the merits of other historians, without their defects. He possesses the distinctness of Xenophon without his uniformity; he is more eloquent than Livy, and is free from his superstition; and he has more knowledge and judgment than Polybius, without his affectation of reasoning on every occasion.

One of the best editions of the works of Tacitus was published at Paris by Brotier, in 4 vols 4to. There have been four translations of his works into English; the first by Greenway and Sir Henry Saville, in the reign of Elizabeth; the second by Dryden and others; the third by Gordon, which is remarkable for affectation of style, though

some think it bears a striking resemblance to the original; and the fourth and best by Murphy, in 1793, in 4 vols 4to.

TACK, a rope used to confine the foremast lower corners of the courses and stay-sails in a fixed position, when the wind crosses the ship's course obliquely. The same name is also given to the rope employed to pull out the lower corner of a studding-sail or driver to the extremity of its boom.

The main-sail and fore-sail of a ship are furnished with a tack on each side, which is formed of a thick rope tapering to the end, and having a knot wrought upon the largest end, by which it is firmly retained in the clue of the sail. By this means one tack is always fastened to windward, at the same time that the sheet extends the sail to the leeward.

TACK, is also applied, by analogy, to that part of any sail to which the tack is usually fastened.

A ship is said to be on the starboard or larboard tack, when she is close-hauled, with the wind upon the starboard or larboard side; and in this sense the distance which the sails in that position is considered as the length of the tack; although this is more frequently called *board*. See that article.

To TACK, to change the course from one board to another, or turn the ship about from the starboard to the larboard tack, in a contrary wind. Thus a ship being close-hauled on the larboard tack, and turning her prow suddenly to windward, receives the impression of the wind on her head-sails, by which she falls off upon the line of the starboard-tack. Tacking is also used in a more enlarged sense, to imply that manœuvre in navigation by which a ship makes an oblique progression to the windward, in a zig-zag direction. This, however, is more usually called *beating*, or *turning to windward*. See NAVIGATION, SAILING, and Naval TACTICS.

TACK, in Scots law. See LAW, n° clxvii.

TACKLE, among seamen, denotes all the ropes or cordage of a ship used in managing the sails, &c.

TACKSMAN. See TENURE.

TACTICS, in the art of war, is the method of disposing forces to the best advantage in order of battle, and of performing the several military motions and evolutions. See WAR.

NAVAL TACTICS;

Or, The Military Operations of Fleets.

Definition.

NAVAL TACTICS is the art of ranging fleets in such order or disposition, as may be judged most convenient, either for attacking, defending, or retreating, to the greatest advantage; and to regulate their several movements accordingly. It is not a science established on principles absolutely invariable, but founded on such reasons as the alteration and improvement of arms must necessarily occasion in a course of time and experience; from which also will naturally result a difference in the construction of ships, in the manner of working them, and, in fine, in the total disposition and regulation of fleets and squadrons. We shall cursorily run through this succession and change of arms, &c. to the present improvement of our lines of battle, in order to make us the more sensible of the reasons which have induced the moderns to prefer so advantageous a choice as they now follow in the arrangement of their ships.

History.

The ancient galleys were so constructed as to carry several banks of oars, very differently disposed from those in our modern galleys, which, however, vary the least of any others from their ancient model. Advanced by the force of their oars, the galleys ran violently aboard of each other,

and by the mutual encounter of their beaks and prows, and sometimes of their sterns, endeavoured to dash in piece, or sink their enemies.

The prow, for this purpose, was commonly armed with a brazen point or trident, nearly as low as the surface of the sea, in order to pierce the enemy's ships under the water. Some of the galleys were furnished with large turrets, and other accessions of building, either for attack or defence. The soldiers also annoyed their enemies with darts and slings, and, on their nearer approach, with swords and javelins; and in order that their missile weapons might be directed with greater force and certainty, the ships were equipped with several platforms, or elevations above the level of the deck. The sides of the ship were fortified with a thick fence of hides, which served to repel the darts of their adversaries, and to cover their own soldiers, who thereby annoyed the enemy with greater security.

As the invention of gunpowder has rendered useless many of the machines employed in the naval wars of the ancients, the great distance of time has also consigned many of them to oblivion: some few are, nevertheless, recorded in ancient authors,

ry. authors, of which we shall endeavour to present a short description. And first,

The *Δολφίν* was a large and massy piece of lead or iron, cast in the form of a dolphin. This machine being suspended by blocks at their mast-heads or yard-arms, ready for a proper occasion, was let down violently from thence into the adverse ships; and either penetrated through their bottom, and opened a passage for the entering waters, or by its weight immediately sunk the vessel.

The *Δοιπανον* was an engine of iron crooked like a sickle, and fixed on the top of a long pole. It was employed to cut asunder the slings of the sail-yards, and, thereby letting the sails fall down, to disable the vessel from escaping, and incommode her greatly during the action. Similar to this was another instrument, armed at the head with a broad two-edged blade of iron, wherewith they usually cut away the ropes that fastened the rudder to the vessel.

Δραχια ναυπηχες, a sort of spears or maces of an extraordinary length, sometimes exceeding 20 cubits, as appears by the 15th Iliad of Homer, by whom they are also called *μακρες*.

Κεραυτοι were certain machines used to throw large stones into the enemy's ships.

Vegetius mentions another engine which was suspended to the main-mast, and resembled a battering-ram; for it consisted of a long beam and an head of iron, and was with great violence pushed against the sides of the enemy's galleys.

They had also a grappling-iron, which was usually thrown into the adverse ship by means of an engine: this instrument facilitated the entrance of the soldiers appointed to board, which was done by means of wooden bridges, that were generally kept ready for this purpose in the fore-part of the vessel. See the article *CORVUS*.

The arms used by the ancients rendered the disposition of their fleets very different, according to the time, place, and circumstances of the engagement. They generally considered it an advantage to be to windward, and to have the sun shining directly on the front of their enemy. The order of battle chiefly depended on their power of managing the ships, or of drawing them readily into form; and on the schemes which their officers had concerted. The fleet being composed of rowing vessels, they lowered their sails previous to the action; they presented their prows to the enemy, and advanced against each other by the force of their oars. Before they joined battle, the admirals went from ship to ship, and exhorted their soldiers to behave gallantly. All things being in readiness, the signal was displayed by hanging out of the admiral's galley a gilded shield, or a red garment or banner. During the elevation of this, the action continued; and by its depression, or inclination towards the right or left, the rest of the ships were directed how to attack or retreat from their enemies. To this was added the found of trumpets; which began in the admiral's galley, and continued round the whole fleet. The fight was also begun by the admiral's galley, by grappling, boarding, and endeavouring to overset, sink, or destroy the adversary, as we have above described. Sometimes, for want of grappling irons, they fixed their oars in such a manner as to hinder the enemy from retreating. If they could not manage their oars as dexterously as their antagonist, or fall alongside so as to board him, they penetrated his vessel with the brazen prow. The vessels approached each other as well as their circumstances would permit, and the soldiers were obliged to fight hand to hand till the battle was decided: nor indeed could they fight otherwise with any certainty, since the shortest distance rendered their slings and arrows, and almost all their offensive weapons, ineffectual, if not useless. The squadrons were sometimes ranged in two or

three right lines, parallel to each other; being seldom drawn up in one line, unless when formed into an half-moon. This order indeed appears to be the most convenient for rowing vessels, that engage by advancing with their prows towards the enemy. At the battle of Ecnomus, between the Romans and the Carthaginians, the fleet of the former was ranged into a triangle, or a sort of wedge in front, and towards the middle of its depth of two right parallel lines. That of the latter was formed into a rectangle, or two sides of a square, of which one branch extended behind, and as the opening of the other prosecuted the attack, was ready to fall upon the flank of such of the Roman galleys as should attempt to break their line. Ancient history has preserved many of these orders, of which some have been followed in later times. Thus, in a battle A. D. 1340, the English fleet was formed in two lines, the first of which contained the larger ships, the second consisted of all the smaller vessels, used as a reserve to support the former whenever necessary. In 1545, the French fleet under the command of the Marechal d'Annebault, in an engagement with the English in the Channel, was arranged in the form of a crescent. The whole of it was divided into three bodies, the centre being composed of 36 ships, and each of the wings of 30. He had also many galleys; but these fell not into the line, being designed to attack the enemy occasionally. This last disposition was continued down to the reigns of James I. and Louis XIII.

Meanwhile, the invention of gunpowder in 1330 gradually introduced the use of fire-arms into naval war, without finally superseding the ancient method of engagement. The Spaniards were armed with cannon in a sea-fight against the English and the people of Poitou abreast of Rochelle in 1372; and this battle is the first wherein mention is made of artillery in our navies. Many years elapsed before the marine armaments were sufficiently provided with fire-arms. So great a revolution in the manner of fighting, and which necessarily introduced a total change in the construction of ships, could not be suddenly effected. In short, the squadrons of men of war are no longer formed of rowing vessels, or composed of galleys and ships of the line; but entirely of the latter, which engage under sail, and discharge the whole force of their artillery from their sides. Accordingly, they are now disposed in no other form than that of a right line parallel to the enemy; every ship keeping close-hauled upon a wind on the same tack. Indeed the difference between the force and manner of fighting of ships and galleys, rendered their service in the same line incompatible. When we consider therefore the change introduced, both in the construction and working of the ships, occasioned by the use of cannon, it necessarily follows, that squadrons of men of war must appear in the order that is now generally adopted.

The machines which owe their rise to the invention of gunpowder have now totally supplanted the others; so that there is scarce any but the sword remaining, of all the weapons used by the ancients. Our naval battles are therefore almost always decided by fire-arms, of which there are several kinds, known by the general name of *artillery*. In a ship of war, fire-arms are distinguished into cannon mounted on carriages swivel-cannon, grenades, and musquetry. See *CANNON*, &c. Besides these machines, there are several others used in merchant ships and privateers, as cohorns, carabines, fire-arrows, oryans, sink pots, &c.

The writers on naval tactics have been but few, indeed, considering the importance of the subject; and the only countries that have produced writers on this subject, so far as we know, are France and Britain, particularly the first. One would be led to imagine that Britain, from its insular situation, having bred so great a number of excellent seamen,

History. and having so often been engaged in naval contests, would naturally have produced a number of writers on this, as well as on subjects of much less consequence to it as a nation. The reader will, however, no doubt be surpris'd to hear, that we have only one scientific treatise on naval tactics, intitled *An Essay on Naval Tactics, &c.* by John Clerk, Esq; of Eldon, near Edinburgh; all the other treatises published in Britain on this subject being either translations from the French, or remarks upon the French authors (A). Some of the principal French treatises on naval tactics are the following: 1. *L'Art des Armées Navales, ou Traité des Evolutions Navales*, par Paul L'Hofte, 1 vol. folio, printed at Lyons 1727. This book was translated and published by Christopher O'Bryen, Esq; in 4to, in 1762. 2. *Tactique Navale, ou Traité des Evolutions et des Signaux*, par M. le Viscompte de Moronou, 4to, Paris 1763. 3. *Le Manœuvrier*, par M. Bourdè de Villehuet. 4. *L'Art de Guerre en Mer, ou Tactique Navale, &c.* par M. le Viscompte

de Grenier. Translations of the two last have appeared in English in 4to in 1788, under the name of the *Chevalier de Saufeuil*; and a translation of parts of the three last is in the 2d vol. of the *Elements and Practice of Rigging and Seamanship*, published at London in 1794. Other books on evolutions and tactics are, *Théorie de la Manœuvre des Vaisseaux*, Paris, 1689. *Pitot's Theory of Working Ships applied to Practice &c.* translated by Stone, 1743. *De la Manœuvre des Vaisseaux, ou Traité de Mécanique et de Dynamique, &c.* par M. Bouguer. *The British Mars, &c.* by William Flexney, 1763. *A Sea Manual*, by Sir Alexander Schomberg, 1789. *A View of the Naval Force of Great Britain, &c.* by an Officer of Rank, 1791, &c.

We shall occasionally consult all these works; and as some of them treat largely of the tactics in present use, while in others new systems are proposed. our article will naturally be divided into two parts, keeping the present practice and proposed innovations totally distinct from each other.

PART I. THE PRESENT SYSTEM OF NAVAL TACTICS.

CHAP. I. Of the Orders of Sailing.

³ Division of a fleet into three squadrons, the van, centre, and rear. A FLEET of ships of war is usually divided into three divisions or squadrons, called the *centre, van, and rear*; and each squadron has a commanding officer. The commander in chief, or admiral of the fleet, is in the centre column; the vice admiral has the command of the van; and the rear admiral, that of the rear. The ships of each squadron are distinguished by the position of their colours. The ships of the first or centre squadron carry their pendants at the main-top-gallant mast head. The ships of the second division carry their pendants at the fore top-gallant mast head, and those of the third division at the mizen-top mast head. Each squadron ought, if possible, to consist of the same number of ships; and also to be of the same force, so that each may be equally able to attack or repulse the enemy; and when in a line, the several parts will be equally strong. When the fleet is very numerous, each squadron is sometimes subdivided in a similar manner into three divisions of centre, van, and rear.

When the fleet is formed in the line or order of battle, each admiral takes his post in the centre of his squadron, the commander in chief being in the middle of the line. If the enemy be not in sight, the fore-ships, fire-ships, sloops, &c. are to be to the windward of the fleet, because they can be more easily supported, and can more readily obey the signals that may be made to them. There are frigates to the windward of the van and rear of the convoy, for the purpose of looking out for the enemy, and keeping those vessels in their proper stations. But if the enemy is in sight, then all those ships which are not to be in the line of battle are to be on the other side of the line with respect to the enemy. If the fleet is sailing in three columns, the first or centre squadron is in the middle between the second and third squadrons; one of which, according to circumstances, forms the starboard and the other the larboard column; and each admiral leads his respective division. If the fleet is destined for a certain place at a considerable distance, it is generally formed into squadrons; but if cruising in expect-

tation of meeting the enemy, the admiral naturally keeps his ships in such sailing positions as may be most advantageous to form for action as quickly as possible. These various positions or arrangements are called *orders*; and that they may be better understood, it is necessary to premise the following definitions:

The starboard line of bearing, is that line upon which the ships of a fleet, being ranged, bear from each other upon a close-hauled line, whatever course they may be steering; and so that, upon hauling their wind or tacking together as may be necessary, the ships will be in a line close-hauled upon the starboard tack.

The larboard line of bearing, is that line from which the ships of the fleet, by hauling their wind, or tacking together, may be formed in a line close-hauled on the larboard tack.

A fleet of ships is said to be in the *line a-breast* when the ships keels are parallel to each other, and their mainmasts in the same straight line.

The bow and quarter line, is when the ships are ranged in a straight line cutting their heels obliquely in the same angle: Hence at any intermediate ship, the ships towards one extremity of the line will be on the bow, and those towards the other extremity will be on the quarter, of that ship.

If several ships stand on the same line and steer the same course, but different from that line, they are said to be in *echiquier*, or *chequerwise*.

Manœuvre in succession, is when a fleet, ranged in one of the orders of sailing, and standing on the same line, the same manœuvre is successively performed by each ship as she arrives at the wake of the van ship of the whole fleet, if in one line; or of the van ship of her particular division when divided into squadrons. So that a fleet tacks or veers, bears away or comes to the wind in succession, when all the ships of every line execute, one after another, the same manœuvre on the same point of the wake of the leading ship.

The number of orders of sailing is commonly assumed to be five; and denominated the *first, second, third, fourth, and fifth* orders of sailing; besides an order of *battle*, an order of *retreat*, &c.

(A) The reason why Britain falls short of the French in this respect, is, that in various sea-ports in France there are academies established for the express purpose of educating those intended for the navy in the various branches of naval science; whereas, in Britain, there is only one academy established at the expence of government, namely, the Marine Academy at Portsmouth; and, excepting navigation, scarcely any other branch of naval science is taught in that seminary. It also requires great interest to be admitted. We are, indeed, well aware that there are boys educated for the sea-service in Christ's Hospital, London, and at Greenwich school, &c. The education there is not, however, adapted for officers in the navy, being only writing, arithmetic, a little mathematics necessary to understand navigation, and navigation.

In the first order of sailing, the fleet is ranged on one of the lines of bearing, and each ship steering the same course. Thus, in fig. 1. let the wind be north, and the fleet ranged on the starboard line of bearing, and let the ships steer any course, as south-west. In this case, the fleet is ready to form the line on the starboard tack by hauling the wind. Again, let the fleet be ranged on the larboard line of bearing, and steering the same course as before, as in fig. 2.; then the fleet is in a position ready to form the line on the larboard tack, by tacking.

In a numerous fleet this method of sailing is defective; as the fleet will be too much extended, and therefore the communication between the van and the rear rendered more difficult than when in a more connected order. It is of use, however, when the enemy is in sight, as then the fleet may be readily formed in order of battle; and in that case only, or in passing through a strait, will it be necessary to range the fleet in this order.

In the second order of sailing the fleet is ranged on a line perpendicular to the direction of the wind, and steering any proper course. This order, which is represented in fig. 3. has the same defects as the former; and has also this disadvantage attending it, that the fleet cannot safely tack in succession from this order, as each ship at the time of tacking is in danger of falling on board the ship next astern; and therefore, if the line is close, the ship astern must bear up considerably, in order to avoid being on board the ship ahead, which at that time is in stays.

The third order of sailing is that in which the whole fleet is close-hauled, ranged upon the two lines or lines of bearing, and therefore containing an angle of twelve points; the admiral's ship being at the angular point, and the whole fleet steering the same course. Thus, in fig. 4. the wind being supposed north, and the fleet close-hauled on the starboard tack: Then A being the admiral's ship, one part of the fleet bears from him west-north-west, and the other part east-north-east.

This order of sailing is no doubt preferable to either of the former, as the ships are more collected, and can more distinctly perceive and obey the signals; but if the fleet is numerous, it will be too much extended.

In the fourth order of sailing, the fleet is divided into six or more columns, as may be judged necessary: by which means the fleet is much more connected than in any of the former orders. The commanders, ranged upon the two lines of bearing, have their squadrons astern of them upon two lines parallel to the direction of the wind; the first ships of each column being, with respect to the commander of their squadron, the one on his starboard and the other on his larboard quarter. The distance between the columns should, however, be such, that the fleet may readily reduce itself to the third order of sailing, and from that to the order of battle. This order is adapted for fleets or convoys crossing the ocean, and is represented in fig. 5. But as it requires much time to reduce a fleet from this order to that of battle, it is therefore defective when in presence of an enemy.

The fifth and last order of sailing is that in which the fleet is divided into three columns close-hauled, and therefore parallel to each other; and also the respective ships abreast of each other. The van commonly forms the weather column; the centre division, the middle column; and the rear division, the lee column. Circumstances may however require the van to be the lee column, and the rear the weather column. If the fleet is very numerous, each division may be divided into two columns; and each admiral is to place himself at a little distance before, and in the direction of the middle of his division. Fig. 6. and 7. represent this order of sailing.

The distance between any ship and that adjacent to it in the same column, and also the interval between the columns, are regulated by the commander in chief according to circumstances. The interval or perpendicular distance between the columns is commonly taken; such as, that the angle contained between the line of the columns and an imaginary line joining one of the extreme ships of that column, and the ship at the other extremity of the adjacent column, may be about two points. The measure of this angle must however depend in part upon the length of the column; and when it is determined upon, the distance between the columns may be found by multiplying the length of one of the columns by the tangent of the above angle to the radius unity: whence, if that angle be taken equal to two points, the length of a column multiplied by the decimal .414 will give the distance between the columns. Thus let a column contain six ships; let the distance between each be 100 fathoms; and the length of each ship from the extremity of the bowsprit to the stern 46 fathoms; then the whole length of the column will be 776 fathoms. Now the above angle being taken equal to two points, the distance between the columns is equal to $776 \times .414 = 321\frac{1}{2}$ fathoms.

The order of battle is formed by drawing up the ships of the fleet in a line nearly close-hauled, and under an easy sail, each ship being at a certain assigned distance from that next ahead, as a half or a whole cable's length. The fire-ships, with frigates ahead and astern, form a line parallel to the former, and to the windward of it if the enemy is to the leeward; but to the leeward if the enemy is to the windward. Without this line another is formed, parallel thereto, of the store-ships, &c. with frigates ahead and astern. Fig. 8. represents the order of battle, the fleet being on the starboard tack.

In retreating from a superior force, it is necessary to draw up the fleet in such an order that it may, with the greatest advantage, oppose or annoy the fast sailing vessels of the enemy: for this purpose, the order of retreat commonly taken is that which is the inverse of the third order of sailing. As the fleet generally runs before the wind, the ships of the line are therefore ranged on the two lines of bearing; hence these lines contain an angle equal to 135 degrees. The admiral is at the angular point, and the frigates, transports, &c. are included within the wings to leeward. In place of running before the wind, the fleet may take any other proper direction; but still the angle contained by the wings is to be 135°. This order of retreat is represented in fig. 9.

The order of convoy is that in which the ships are all in the wake of one another, steering on the same point of the compass, and forming a right line. If the fleet is numerous, it may be divided into three columns, which are to be ranged parallel to each other, that of the admiral occupying the middle, and all steering the same course.

Having defined the different orders of sailing, we shall now proceed to show the method of getting a fleet under way, and of bringing it to an anchor.

In order to get a fleet under way, the lee column is to get under way first, and bring to all at the same time, just as they find themselves after casting. The centre column is then to perform the same manœuvre, and cast likewise as soon as the other column is brought to; and both columns will remain in that position till the weather column, which is still ahead, having weighed, shall be also under way. The three columns may often be got under way all at once: but to execute this the fleet must all act together, and with equal ardour; for the weather ships must not, at any rate, be under way before the lee ones. If it be necessary to get immediately in order of battle, the weather columns are at once to bear away two points together, that they may take their posts in the line of battle ahead of the lee column.

Orders of Sailing.
Method of forming the line between the columns.

Order of battle.

Order of retreat.

Order of convoy.

To get a fleet under way.

Orders of Sailing.

If the fleet be moored in a line, head to wind, the rear ship may get under way first, and haul immediately by the wind; the others in succession, from the rear to the van, can easily take their station in her wake, so that the rear ship will now become the leader. Or, the fleet may all get under way at the same time; but the van ship is to bring to, while the rest, casting the other way, would stand on by the wind on the same tack on which they have cast, and come to tack successively in her wake, to form the order of battle.

21
To bring a fleet to an anchor.

To bring a fleet to an anchor, it ought, if considerable, to anchor in three parallel lines, on one of the lines of bearing, and at the proper distance which the length of the columns require; the distance between the adjacent ships in the same column being about a cable's length. The van and rear of the columns are to correspond with each other exactly in the direction of the wind, that they may with ease get under way, and form the order of battle with facility, so as to be able to dispute the weather-gage with the enemy if he should come in sight. As this evolution is to be performed in moderate weather, the fleet being in three columns, they are all at the same time to bring their ship's head to the wind under their topsails, and let go their anchors together, clewing up their topsails with all possible dispatch; putting the foot of the sails in the tops, and loosening the sheets before hauling them down; then veering away an equal quantity of cable to preserve the assigned distance. When it blows so fresh as to require the topsails being reefed, two cables length may be kept between the ships, and even three if it be likely to blow hard.

If the fleet do not exceed 20 ships, they may anchor on one of the lines of bearing; or parallel to the coast, in places where trade-winds are common, provided they blow in the direction of the land; for, in all cases, they must be in a condition to get under way at the first sight of the enemy, whose approach is never to be waited for at anchor; because, if it be dangerous for a single ship, it must be still more so for a fleet, the movements of which are interrupted by the difficulty there is in getting with celerity under way ships which are moored, and which, in that case, are not able mutually to support one another, as is absolutely requisite in a fleet.

CHAP. II. *The Manner of Forming the several Orders of Sailing.*

22
To form the first order of sailing.

The first order of sailing is formed as follows: As the fleet is supposed to be in no particular order, that ship which is to lead on the proposed line of bearing on which the fleet is to sail, runs to the leeward of the whole or greater part of the fleet, and then hauls her wind, carrying an easy sail: each ship then endeavours to get into her proper station, by chasing the ship which is to be next ahead of her; and when in the wake of the leader, must take care to preserve the assigned distance from the ship immediately ahead, by increasing or diminishing the quantity of sail: and if any of the fleet should happen to be so far removed from her second ahead as not to be able to chase her without getting out of her way towards the line, in that case she must take her station discretely in a line with the leaders, and leave a proper interval. The fleet will now be formed in the line of battle; from which the first order of sailing is formed by each ship bearing away at the same instant, and steering each the same proposed course.

23
To form the second order of sailing.

To form the second order of sailing, the leader runs to the leeward of the whole, or of so many of the fleet as that each ship may easily fetch his wake, and then steers a course eight points from the wind, carrying an easy sail. Each

ship now gets into her proper station, by chasing that which is to be ahead of her; and when the whole fleet is formed in a line, which will be perpendicular to the direction of the wind, each ship bears away at the same instant, and the whole steers the same intended course.

In the third order of sailing the admiral is in the middle of his fleet. Now, the fleet being formed in a line, on one of the lines of bearing, as above directed, and the ships steering in the wakes of each other, or ten points from the wind, the leading or leewardmost ship first hauls her wind; the second ship, as soon as she is in the wake of the leader, hauls her wind also; and in like manner each ship until the admirals successively haul their wind as soon as they have reached the wake of the leading ship; and at the same instant that the admiral's ship hauls her wind, the other, or sternmost half of the fleet, do the same. The fleet will then be in the third order of sailing, as represented in fig. 4. From this order of sailing the fleet can be expeditiously formed into the line of battle on either tack.

As the fleet, in the fourth order of sailing, is divided into six columns, and the three commanders ranged on the two lines of bearing, the commander in chief being at the angular point; in order, therefore, to form this order, the admirals range themselves on the two lines of bearing, at a proper distance from each other, and steer the proper course; the ships of the several columns come each into its respective place, forming themselves into lines in the direction of the wind, and parallel to each other, as in fig. 5.

In order to form the fifth order of sailing, the three leading ships of the divisions are to take their posts abreast, and to leeward of each other, keeping their wind under an easy sail. Then the ships of each squadron making sail, will range themselves in their respective stations, astern of their leaders, and keeping the same course; each ship preserving the appointed distance from that next ahead; and the commanders of each division, and each second, third, &c. ship, are to keep themselves mutually abreast of each other.

To form the order of battle, it has already been observed, in the first order of sailing, that the ship which is to lead runs to the leeward of the whole, and then hauls her wind upon the tack directed, carrying an easy sail. Each ship then makes sail according to her distance, and chases the ship which is to be immediately ahead of her in the line, and hauls in her wake in the line on which the van ship is moving.

The admiral, or ship appointed to make the angular point, runs to the leeward of the fleet, and brings to; then each ship runs to its respective station in one of the lines of bearing, and brings to; one half of the fleet being on one of the lines of bearing, astern and in the wake of the admiral, and the other half on the other line of bearing, on the starboard or larboard bow of the admiral. When this is accomplished, the whole fleet bears away before the wind: the two wings will now bear from the admiral two points before his beam, and ready to form the line of battle upon either tack; the ships on the admiral's starboard bow being in the line of bearing for the larboard tack, and those on his larboard bow in the line of bearing for the starboard tack.

CHAP. III. *To Change from the several Orders of Sailing to the Line of Battle.*

To form the line from the first order of sailing: If the ships be running large on the tack answering to the line of bearing on which they are sailing and the line to be formed on the same tack, all the ships haul the wind at the same time, or at least each ship hauls her wind immediately after the next to windward: but if the fleet be on the other tack with

48 To change to the fifth order of sailing on the same tack.

the van, and the weather the rear division: The weather-column brings to, the other columns make sail and stand on, till they can pass on the other tack ahead of the weather-column, when they tack in succession. When both columns have passed the weather column, it fills, tacks in succession, and forms the rear. See fig. 24.

To form the line on the other tack from the fifth order of sailing, the lee-column forming the van: The weather and centre columns bring to; the lee-column carries a press of sail, and tacks in succession when it can pass a-head of the weather-column; and when the last ship of this new van has passed to the windward of the former weather-column, the van squadron shortens sail, to give time for the other columns to form: the weather and centre columns fill at the same time, to gain the wake of the van; when they tack in succession. See fig. 25.

To form the line from the order of retreat: The leader of the wing, which is to form the head of the line, hauls the wind, and that wing follows in succession; the other wing goes four points free together on the same tack, and thus runs parallel to the wing which first began the evolution; and they haul up together when they arrive in the wake of the line. See fig. 26.

CHAP. IV. To change from the Line of Battle to the different Orders of Sailing.

To change from the line of battle to the first order of sailing on the same tack: All the ships bear away together the number of points directed by the admiral, observing to keep themselves in the line of bearing for the tack they are in. The sternmost ship bears away first, and the rest successively as quickly as possible, to prevent being too near each other.

To change to the first order of sailing in bearing for the line on the other tack: The leader bears away four points to leeward, and is followed in succession by the rest. When the sternmost ship has bore away, the whole haul up, and they will be in bearing for the line on the other tack. See fig. 27.

To change from the line of battle to the second order of sailing: The whole fleet bears away together ten points; and so proportions the sailing from the van to the rear of the line, that when the headmost ship, which first presses sail, shall come abreast of the second ship, the second ship adapts her sail to keep in this bearing; and so on in succession, each observing to keep the ship that immediately preceded her in the evolution in a line with herself, perpendicular to the direction of the wind; and the whole fleet will now be running before the wind (see fig. 28.) But if it is intended that the fleet shall steer any other given course than that before the wind, the whole fleet may then alter together to the proposed course.

To change to the third order of sailing from the line of battle: The whole fleet bears away together ten points; the headmost half of the fleet, including the centre ship, carry an equal degree of sail, in order to preserve their line of bearing; each ship of the remainder of the fleet carries less sail in succession, such as will form and preserve on the other line of bearing with respect to that upon which they were ranged before the evolution; and by this means the fleet will be formed in the third order of sailing. See fig. 29.

To change from the line of battle to the fifth order of sailing on the same tack: In the treatise of *Naval Tactics*, published in the second volume of *The Elements of Rigging and Seaman'ship*, there are various rules for performing this evolution, according as the different squadrons in the line of

battle are intended to form the weather, the centre, and the lee columns, in the order of sailing. We shall give two of them as examples.

1. When it is intended to change from the line of battle to this order of sailing, so as that the van shall form the weather, and the rear the lee column, and the fleet at the same time keep as much to windward as possible; the van and centre tack together, and run close-hauled in bow and quarter-line; the rear moves on in its former course under an easy sail. When each ship of the centre is abreast of its correspondent ship in the rear, the centre retacks: the van stands on until the centre and rear come up, and then retacks, and all the columns regulate their distances. See fig. 30.

2. When it is intended that the van shall form the lee, and the rear the weather column; the van bears away together under an easy sail, and goes at right angles with the line ahead: the centre at the same time goes away two points free, and each ship steers for that ship of the van respectively which is to be abreast of her when in column. The leader of the van must determine the distance, by not hauling up with his division until his ship and the sternmost ship of the centre-column, which is drawn up with him, are in a line at right angles with the wind: They then both stand on under an easy sail, while the rear crowding sail passes to the windward of both. See fig. 31.

To change from the line of battle to the fifth order of sailing on the other tack: This evolution may be performed in as many ways as the former, according to the intended positions of the different columns; but in such a Work as this our's, it may be sufficient to observe, that,

1. When the van is meant to form the weather, and the rear the lee column: The van tacks in succession; the leader of the centre tacks when the leader of the van is passing him exactly to windward, and his division follows him; the rear manœuvres in the same manner with respect to the centre. See fig. 32.

2. When the rear is to form the weather, and the van the lee column: The van tacks in succession; and when about, either brings to, or shortens sail, to allow the other columns time to form. The centre and rear then carry sail, and tack in succession. The centre tacks when its leader has the centre of the lee-column in a line at right angles with the wind, or when its centre passes astern of the lee column. When the centre is about, it regulates its rate of sailing by the lee-column, either by bringing to or making equal sail; and thus both wait for the rear to pass to windward. The rear tacks when its leader has the first ship of the lee-column in a line at right angles with the wind, or when its centre ship passes astern of the last ship of the centre-column. See fig. 33.

To change from the line of battle to the order of retreat: The leader bears away four points; and all the fleet following close-hauled, they will come to file off in succession at the same point in the van ship's wake, till the centre ship arrives at the angle where the evolution began. Then the order of retreat will be formed, and any course whatever may be steered, since the two wings will be equal and in order on the starboard and larboard lines of bearing, forming consequently between them an angle of 135 degrees. Fig. 34. represents the order of retreat formed from the line of battle, the whole fleet going four points free.

CHAP. V. To Manœuvre the Line of Battle.

THE method of forming the line of battle, when the ships are in no previous order, has already been explained. In this place it is intended to point out some of the various evolutions

are evolutions that are, or may be, performed by a fleet which is already formed in line of battle.

The fleet being in line of battle, to form the line on the other tack, by tacking in succession: The headmost ship of the fleet tacks first, having previously made more sail, or the second having shortened sail, in order to increase the interval between them; for it often happens that one or two cables length are run over before the ship ahead has been able to fill her sails on the other tack. When the first ship is about, either the second makes more sail, or the third shortens sail; and then the second tacks as soon as she has gained the wake of the leader, the helm being put down at the instant she opens the weather quarter of the first ship, which is already on the other tack. In like manner the third, fourth, &c. ships tack each at the instant it has gained the wake of the leader; and those ships already about must preserve their assigned distances, by shortening sail, if necessary, until the whole fleet is on the other tack. If a ship misses stays, she is immediately to fill again on the same tack, and make sail with all possible expedition, taking care to keep as close as possible to the wind, and not to fall off to leeward. By this means she will get ahead and to windward of those which follow her; and they will perform successively their evolutions in the wake of the ships which are already on the other tack, only standing on a little farther than they would have done if the ship ahead had not missed stays. The ship that missed stays will return sooner to her station, by making all possible sail to windward of the line. See fig. 35.

To form the line on the other tack without tacking in succession: The whole fleet veers together: the rear ship hauls her wind on the other tack, and stands on, while all the others go two points free on the other tack, and haul up as they successively gain the wake of the leading ship. Thus the rear of the line on the one tack becomes the van on the other tack. See fig. 36.

The line to veer in succession: The van ship of the line veers round, and steers four points free on the other tack; and when she is clear of the rear ship of the line, she hauls her wind; the rest follow, and haul up in succession. See fig. 37.

The line to tack and retack together: In tacking together, the sternmost ship of the line puts in stays; then her second ahead puts her helm down; and so on through the whole line, to prevent the ship ahead from falling on board the ships astern. The fleet will then be in bow and quarter line; from which, if tacking together, no ship must put in stays till the ship on her weather quarter is in the act of tacking.

The line bear away together, preserving their bearing for the line: The rear begins this evolution, the sternmost ship bearing away the number of points proposed; and so on as quickly as possible, to prevent falling on board of each other.

To turn to windward in line of battle: When the fleet has sea-room, the most advantageous method of gaining to windward is, that all the ships of the fleet may go about together; as by this means the whole fleet will gain as much to windward as in the case of a single ship. The fleet will be in line of battle on the one board, and in bow and quarter line on the other. This is also the most proper method to get to windward on a coast when the wind is parallel to the land: But if the fleet is turning to windward in a strait or between two shores, the fleet should tack in succession; for if all the ships tacked together, the van would be soon in with the land on one side, and soon after the fleet had retacked the rear would be in with the land on the other side: hence this would occasion a number of short boards. In

passing through a strait, other circumstances are also to be attended to, as tides, &c.

To interchange the van and centre squadrons: The van bears away a little, and brings to; the centre passes on to windward, edging a little, to get ahead of the former van on the same line; the rear, coming on under an easy sail, edges away likewise, to obtain the wake of the new centre squadron. See fig. 38.

To interchange the van and rear squadrons: The van and centre squadrons bear away a little, and then bring to, the van observing to bear away a little more to the leeward than the centre. The rear stands on to gain the head of the line; and when abreast of the former van, the centre fills, and both standing on, form ahead of the new rear, by edging down until they are in a line with it. See fig. 39.

To interchange the centre and rear squadrons: The van stands on under an easy sail, while the centre bears away a little and brings to, and the rear at the same time carries a press of sail to pass the centre to windward and get into the wake of the van. The van and centre then edge away to gain the line with the new rear squadron, which then fills. See fig. 40.

The van to pass and form the rear: The van squadron edges away a little and brings to; the other two squadrons, crowding sail, stand on till they get ahead of the new rear, and then edge away a little to form in the line; after which the rear fills.

The rear to pass and form the van: The van and centre bear away a little and bring to; the rear makes sail, passes ahead of both, and then edges away to form on the same line. These two manœuvres are so simple as not to stand in need of illustration by figures.

CHAP. VI. To Manœuvre a Fleet formed in the Fifth Order of Sailing.

This order of sailing is very advantageous for a numerous fleet, as it keeps the ships closer together, and therefore more connected with each other than either of the three first orders. The method of forming this order is shown in Chap. II.: and the method of manœuvring in it, which with very little alteration is also applicable to the fourth order, is to be the subject of this chapter.

To tack the columns in succession: The ships of the leeward column having more distance to run before they can recover their position, must go about first in succession. When the centre leader finds himself abreast of the leader to leeward of him, or at right angles with the close-hauled line on the other tack, upon which the lee leader is now moving, he tacks, and is followed in succession by his division. The weather-column paying the same regard to the centre-column, manœuvres in the same manner (see fig. 41.) In this evolution the weather-column still continues to windward; and should the columns have closed too much, or be too far asunder, either of which may happen from the inequality in the rate of sailing of the different ships, the order may be recovered either by the lee or windward column bearing away, so as to make an angle equal to that proposed, as two points, between any column, and a line joining the leader of that column and the sternmost ship of the next column.

If this evolution is to be performed in the night, the weather-column must tack first. In order to prevent the risk of one column passing through the van of the other columns, the next column must not tack till its leader is sensible that many ships of the column immediately to windward are about. When about, the leaders make little sail, while their followers make successively a little more, in order to form their respective columns. The columns which are

Order of
sailing.

pletely about should either bring to and wait for the next, or should just keep steerage way; thus the former weather-column should wait for the centre, and both should then wait for the former lee column. In this evolution the weather and lee columns will be interchanged. As some risk may attend the execution of this at night, it is most advisable to tack the columns together, and sail in bow and quarter line; because, should it become necessary to retack, or should the wind change before the completion of this evolution, much confusion might ensue. By tacking together this will be avoided.

68
To tack to-
gether.

To tack the columns together: The sternmost ships of the three columns put in stays together; and when they are observed to be so, their seconds ahead immediately put their helm down, and so on through the whole fleet. Each column will then be in bow and quarter line. See fig. 42.

69
To veer in
succession.

To veer the columns in succession: The leader of the lee-column veers round, and steers four points free upon the other tack, followed by the ships of that division; and of which, when he is clear of the sternmost ships, he hauls up. The centre and weather columns perform successively the same evolution, observing to continue standing on till they successively bring the point at which the lee-column began to veer to bear in a right line to leeward of them. They likewise successively spring their luffs when the point at which the lee-column hauled its wind bears right to leeward (fig. 43.) Each column having the same distance to run, if the evolution be well executed, the leaders of the windward columns will find themselves, when they spring their luffs, exactly abreast of the leader of the lee-column, and so will all the other ships. But the making or shortening sail will at all events rectify the inequality of sailing.

70
To turn to
windward.

To turn to windward in the fifth order of sailing: Let the ships of the fleet be so arranged, that the leaders, and also the corresponding ships of the columns, may be in the direction of the wind; as by this means the fleet will gain more to windward, and at the same time be less liable to disorder. Now the van ships of the columns tack at the same instant, and are followed in succession each by the remaining ships of the division, when they reach the wake of their leaders, or the same point when they went about; hence there will always be three ships in stays at the same time until the whole fleet has got on the other tack. The fleet then stands on any assigned distance, and then retacks in the same manner as before. See fig. 44.

Plate
ccccxviii.

71
To inter-
change the
weather
and centre
columns.

To interchange the weather and centre columns: The weather and lee columns lie to, or only keep steerage way. The centre column tacks together; and forming a bow and quarter line, goes close-hauled to gain the wake of the weather-column; it then retacks together, and stands on, while the weather-column bears away to its new station in the centre, and the lee-column fills. See fig. 45.

72
The wea-
ther and
lee co-
lumn.

To interchange the weather and lee columns: The centre column brings to; the lee column stands on under a press of sail; and when its sternmost ship can pass to windward of the van of the centre column, which will be when the centre ship of the lee column is in a line perpendicular to the direction of the wind with the van of the centre column, the lee column then tacks together, and stands on close-hauled till it comes in a line with the centre column, when it goes large two points to get into the station which the weather-column left; and then veers together, hauling the wind for the other tack. At the beginning of the evolution, the weather column bears away together under little sail, and goes large six points on the other tack, so as to get into the wake of the centre column; it then hauls to the former tack, going two points large, till it ranges abreast of the

centre column, when it brings to, and waits for the new weather column. See fig. 46.

To interchange the centre and lee columns: The centre and weather columns bring to, or keep steerage way, as is most convenient: the lee column tacks together, and presses sail to gain the wake of the centre column; which, when they have effected, they retack together and stand on; the centre-column then edges away under an easy sail, steering, if it lay to, eight points from the wind, and if it kept steerage way only two points, until it comes into the station of the lee column, where it hauls to the wind; while the weather-column fills and stands on: and the order is re-established by shortening or making sail, according to circumstances.

The weather-column to pass to leeward: The weather-column stands on under very little sail, while the centre and lee-columns tack together, and carry a press of sail till they reach the wake of the weather-column, when they retack, and crowd sail till they come up with the weather-column; and when they have gained the wake of the weather-column, it bears away two points, to gain its station to leeward, and then hauls to the wind or brings to till the new weather and centre columns come up. See fig. 47.

The lee-column to pass to windward: The weather and centre columns bring to, while the lee column carries sail and tacks in succession as soon as the leading ship can weather the headmost ship of the weather-column; and when arrived upon the line on which the weather-column is formed, it re-tacks in succession, forms on the same line, and either brings to or stands on under very little sail. If it brings to, the other two columns bear away together two points, to put themselves abreast of the column now to windward; but if the new weather-column stood on under an easy sail, they may bear away only one point to gain their proper stations. See fig. 48.

As it is of the utmost importance that each ship be in her respective station, both to preserve order, and that the various evolutions may be more readily performed, the officer of the watch will therefore be ever anxious to preserve the station of his ship. This he may do by his quadrant; but the more ready method for this purpose is by means of the NAVAL SQUARE, which is constructed as follows:

Upon some convenient place at the middle of the quarter-deck, describe the square ABCD (fig. 49.), of which the sides AD and BC are parallel to the keel; through the centre line G draw the line EF parallel to AD or BC, and draw the diagonals AC and BD; bisect the angles EGD, EGC by the straight lines GH, GI, and the naval square will be constructed. Now since the angles FGD, FGC are equal to four points, being each half a right angle; therefore the angles EGD, EGC are each equal to 12 points, and consequently the angles EGH, EGI are each equal to six points. Hence, if a ship is running close-hauled on the starboard tack, in the direction FE, the direction of the wind will be IG, and her close-hauled course on the other tack will be GC: But if she be running in the same direction FE upon the larboard tack, her close-hauled course on the starboard tack will be in the direction GD.

In order now to apply the naval square to the keeping of ships in their respective stations, let the fleet be formed in the fifth order of sailing close-hauled, the corresponding ships of the columns coinciding with the direction of the wind, in order to turn to windward with greater facility. The corresponding ships in the column must be kept in the direction of GH, or GI, according to the direction of the wind and the tack they are upon, while all the ships of

the same column must be in the direction of EF. See fig. 50.

Again, let the fleet be in three columns in one of the lines of bearing, the ship being close-hauled on the other tack. The ships of each column will be in the direction of one of the diagonals, while the corresponding ships of the other columns will be in the direction of the other diagonal (fig. 51). It will also be the same if the columns are in one line of bearing, and going four points large on the same tack. The application of the naval square in other cases will be obvious.

CHAP. VII. *To restore or reform the Order of Battle upon Shifts of the Wind.*

I. LET it be intended to restore the order of battle on the same tack, the wind coming forward, and shifting ahead less than six points. In this case, the whole fleet is to bring to except the leader; who, in order that the same distances between the ships may be preserved when the line is reformed, steers a course *ab* (fig. 52.), such as to be at right angles to the middle point between the former and present direction of the wind; hence the course he must steer will be known by adding half the number of points the wind has shifted to eight points, and applying this sum to the former close-hauled course. As soon as the leader has arrived at the new close-hauled line with respect to the second ship ahead, that ship immediately fills, and bears away the same number of points as the leader; and when both these have reached the close-hauled line with respect to the third ship, she also fills, and bears away. In like manner the remaining part of the fleet bear away in succession; and when they have got into the close-hauled line *bc* with the sternmost ship, they all haul their wind at the same instant, and the sternmost ship fills and stands on close-hauled.

A very expeditious method of performing this evolution is as follows: The whole fleet having fallen off as soon as the wind shifted the same number of points which it changed, the leader bears away eight points from the middle point between the former and present directions of the wind; or, if the wind has shifted near six points, in this case the leader must bear away eight points from the new direction of the wind; but then the fleet will be closer than before, and the leader hauls his wind as soon as the sternmost ship bears on the close-hauled line from him: The second ship bears away when she has reached the wake of the leader, and also hauls her wind when she has again gained his wake. In like manner the third, fourth, &c. ships bear away, and also haul their wind in succession, until the sternmost and the whole line is formed again. See fig. 53.

If the wind shifts exactly four points ahead, the whole fleet is to veer round till the heads of all the ships are directed to the point exactly opposite to their former course; and the rear ship, which has now become the van, is to run four points large upon her new tack, and the rest of the fleet to follow her in succession; and when the last ship, which was the former leader, is got into the wake of the headmost in the line, the whole fleet is to veer together, and the order will be reformed on the former tack.

If the wind shifts eight points forward, the ships are to

veer round altogether till their heads are on the point of the compass opposite to their former course; then the rear ship, having become the van, is to haul close by the wind on the same board; all the other ships are to haul up in succession, and range in the wake of the leading ship; and when the last ship is in her station, the order will be reformed on the same tack.

If the wind changes 12 points exactly, the fleet must veer round together, and haul their wind in succession on the first tack.

2. The wind coming forward, and the order of battle to be reformed on the other tack.

If the wind shifts ahead less than six points, all the ships of the fleet are to veer round, till their heads come to the opposite point of the compass with respect to their former course; and then the rear ship, which is now become the van, is to haul close by the wind on that tack, and the other ships follow her in succession. From hence the fleet might pass to the line of battle on the former tack by veering in succession. If the wind comes ahead more than six points, but less than twelve, the fleet is to manœuvre in the same manner as before. If the wind comes ahead exactly twelve points, the tack is to be changed.

3. When the wind shifts aft, and the order of battle to be reformed on the same tack.

If the wind has shifted less than two points, the leader hauls his wind, the fleet stands on as before, and each ship hauls her wind in succession as she gains the wake of the leader. If it is intended to change the tack, the whole fleet tack together, and the sternmost ship, which now becomes the leader, hauls up, and the rest bear down and haul up in succession.

If the wind changes sixteen points, all the ships brace about for the other tack immediately, by which means the fleet will be going four points large; then the ships tack, ing or veering instantly together, the order of battle will be restored or formed again on the same tack as they were before the wind changed.

CHAP. VIII. *Of the Battle.*

In a naval engagement, the present mode, as has already been observed, is to draw up the fleet in a straight line upon one of the close-hauled lines under an easy sail. The frigates, fire-ships, transports, &c. are placed at proper distances on the other side, with respect to the enemy (B). The distance between two adjacent ships in the line is usually about a cable's length; but the admiral increases or diminishes this interval according to circumstances. The nearer, however, the ships are to each other, the stronger is the line, and the more difficult to be broken or forced by the enemy; but still there must be a sufficient interval left, so that if a ship receive considerable damage, she may be got out of the line without becoming foul or falling aboard of the ship next astern, which would be the means of putting the whole line in confusion.

The strength of a fleet depends also more on the largeness of the ships, and the weight of the metal, than in their number. The fewer the number of ships in a fleet, the more distinctly will the signals be perceived and answered by those near the extremities of the line; the better also will the order

(B) Several able officers have been of opinion, that when fleets are ranged in order of battle, instead of being close-hauled, they should have the wind two points free, or upon the beam. Some of the reasons alleged in support of this opinion are, that the ships can more easily keep their stations; and if any ship should happen to fall to leeward, she may easily regain her station, which would be almost impossible were the fleet close-hauled.

The Battle. der of battle be kept, and the fleet more easily manœuvred. A large ship is not so soon disabled as a small one; and in the case of a three-decker, although the upper deck should happen to be confused with the wreck of broken masts, yards, &c. and hence it being scarcely possible to work the guns on that deck, yet if the weather be not tempestuous, the guns on the other two decks may be worked. If boarding should be deemed practicable, it is evident that the large ship, upon account of the height of her side, as well as for other reasons, will have greatly the advantage over one of a less size. Large ships are also for the most part more able to encounter a storm than small ones; and in a gale of wind large ships have commonly the advantage in point of sailing. Hence it is obvious, that a fleet composed of large ships may have greatly the advantage over a fleet consisting of less ships, though much more numerous.

As in a naval engagement the two fleets are drawn up close-hauled, on two lines parallel to each other, one of these fleets is therefore to the windward of the other. The windward fleet has several advantages not possessed by the fleet to leeward, and the leeward fleet has also advantages over the weather fleet. The advantages and disadvantages of each of these fleets are as follow:

92
Advantages of the fleet to windward.

The fleet to windward may approach the leeward fleet at pleasure, and can therefore determine the time of commencement of the action. If the weather fleet is more numerous, it may send down a detachment of ships on the rear of the leeward fleet, and thereby put it into confusion. If any of the ships of the fleet to leeward should be disabled, the fleet to windward may with great ease send down their fire-ships upon them, or send a detachment after any part that gives way. The weather fleet may board if the admiral thinks proper; and it is scarcely incommoded with the smoke, which is carried off by the wind to the fleet to leeward.

93
Disadvantages of the fleet to windward.

The disadvantages of the fleet to windward are, an inability to quit the fight when once engaged, without being obliged to pass through the enemy's line, which is extremely dangerous; because the ships being already very much injured before they are obliged to fly, they run? expect to be still more so; and as they have it no longer in their power to form the order of retreat, this manœuvre is absolutely a desperate one. If the fleet to windward tack altogether, in order to get off, the line to leeward may do the same, after having raked the weather ships in stays, and follow them on the other tack, with the advantage of having gained the wind of the centre and rear divisions of the flying line. If it blow fresh, it is seldom that weather ships have their lower deck guns sufficiently elevated; whence it results, that the ship being a little inclined on the lee side, the guns often run out again at their ports after being fired, which very much retards the service of the artillery, since the guns are obliged to be bowled in again every time for loading; and oftentimes they can make no use at all of their lower tier. Again, such of the ships as are so disabled as to be obliged to quit the line, cannot easily do it, because in veering, for want of being able to tack, they fall between the two lines, where they are raked ahead, and by that means completely put in disorder: but should they be fortunate enough to be able to finish their evolution, it is still very difficult for them, disabled as they are, to get to windward of their line, and very often they fall foul of the next ships astern of them, which have it scarcely in their power to prevent the accident on account of the fire and smoke, especially if the line is much contracted; and should these perceive it, and try to avoid being run foul of by falling back on their next ship astern, and so on thus successively, it might happen, that from one to the other a great part of the fleet being obliged to manœuvre, their fire would

lessen, and very often cease, by their covering each other; when, if the enemy take the advantage of this critical moment, the disorder increases, and all is lost. But these inconveniences may be partly prevented by having the disabled ships quickly towed out of the line by the boats of the fleet, which for that purpose should always be hoisted out from each ship before the engagement begins. Otherwise, if the ships in the weather line, not being too close, have the necessary space to observe what passes ahead of them, and to manœuvre, they ought to range themselves to leeward of the disabled ship, in order to cover her, and approach nearer to the enemy; all the other ships bearing up also together to preserve the line.

The ships in the line to leeward have the advantage of serving with facility and effect their lower deck guns in all weathers proper for fleets to come to action: they can quit the engagement at pleasure: their disabled ships can without difficulty quit their stations when necessity requires it: they can form the order of retreat with more readiness, or continue the action as long as convenient: in short, the lee line of battle, if superior in number, can also double the enemy, by making some of the ships in the van or rear to tack, and put one of the extremities of the enemy's line between two fires; and if they are formed in time, they may cannonade the enemy while bearing down to the attack.

The disadvantages of the fleet to leeward are, its being very much annoyed by the smoke, and a continued shower of fire from the wads falling on board, repelled by the wind, which it not attended to may be productive of dreadful consequences. The ships of the line to leeward cannot attempt to board those of the other whatever may be their inclination for it; they can hardly do more than accept the battle, without being able to determine either time or distance: it is even with great difficulty that they can avoid being boarded, or prevent their line from being broken, if the weather ships are bent upon doing it; and their fire-ships are very seldom of use.

A general rule for the adoption of either the weather or lee gage cannot be laid down. Sometimes the one is preferable, and sometimes the other; and very often the commander in chief has it not in his power to make an option.

Having proceeded so far with respect to the line of battle, it may not be improper to introduce in this place an account of a naval engagement, with the conduct to be observed previous to, and during the time of, its continuance.

The engagement will not begin till the admiral makes the signal, unless an action is insensibly brought on by some unavoidable circumstances in the line, or position of the van or rear of both fleets in forming or approaching each other. The admiral in such case will make the proper signal for the van or rear. By the distinguishing flag of either of these divisions, which will undoubtedly regulate the necessary manœuvres of the rest of the fleet throughout the whole line.

During the time of an engagement the greatest silence is to be observed in each ship; no one must quit his post upon pain of death; and should any one happen to refuse obeying an officer, he shall be put to death on the spot; the same also shall be done to any one who shall hide himself, or feign to be wounded. The wounded must be carried or conducted to the surgeon by those who have been appointed by the captain for that purpose. Should any one discover an advantage to be taken, he shall inform the officer who stands nearest him. No kind of rigging whatever is to be touched without an order. Should any dangerous shot be received at the water line of the ship, such of the calkers, or carpenters, or any other person who perceives it, shall inform in private the captain with it, without saying a word of the same to any one else upon pain of death, unless

unless it be a superior officer; the same precaution shall also be observed about any part of the ship catching fire.

Whilst the fleets are engaged, the admiral carries but little sail: in this, however, he must conduct himself by the motions of the enemy, the ships always observing to keep close in the line; and if any ship happen to get out of the line, the ship which immediately follows is to pay no regard to her, but endeavour to keep her station in the line.

A captain must not quit his post in the line upon any pretence whatever, unless his ship should be so greatly damaged as to render her incapable of continuing the action. The little sail a fleet is under at such a time may in general give the ships, though damaged in their rigging, &c. time enough to repair their defects, without causing an unnecessary interruption in the line, by withdrawing out of action when their service might perhaps be of the utmost importance to the rest of the fleet.

A captain, through too impetuous a desire of distinguishing himself, ought never to break the order of the line, however inviting the advantage of an attack might then appear to him to secure success: he must wait with patience the signal of the admiral or commanding officer of his division, because it is always more essential to preserve and support a close line in action, as it constitutes the principal strength of a fleet in general, than to attend to a particular attack between two ships, which commonly decides but little with regard to the whole, however glorious in appearance, unless with a view at the same time of taking or destroying a flag ship of the enemy's, and where success alone, even then, can justify the attempt.

The two immediate seconds to the admiral ought to direct part of their fire against the enemy's flag-ship, or any other that may attack their admiral; so that their chief attention should be employed more in his defence than in that of their own proper ship, as they must sacrifice every other consideration to the honour of their flag.

The same attention must likewise be paid to any other ship that may find herself engaged with one of the enemy's flag-ships; the next to her ahead and astern should serve in that respect as seconds, by dividing part of their fire against such flag officer, in order to make him strike the sooner.

If any flag-officer stand in need of being assisted, he will of course make a signal for the corps de reserve; or if there should be none, he will signify the same to his division; on which his two seconds, with those nearest him, will close in to cover him, and continue the action. The frigates of his squadron will likewise be ready to give him the necessary assistance; and if he should still continue the attack, he will in a particular manner be supported by his whole division.

Those ships which happen to be most exposed to danger will naturally make the ordinary signals upon the occasion if they should receive any hurt or damage, in order to be supported by such of the line as are nearest to them.

When a fleet is so far superior in number as to be able to extend itself both ahead and astern considerably beyond the enemy's line, the admiral generally forms the excess into a body of reserve, drawn up in a line on the other side of the fleet with respect to the enemy. If the body of reserve is to windward, the ships composing it are to be drawn up in a line with the frigates nearest abreast of the centre; but if to leeward, a little ahead of them; being careful at the same time to keep within reach of observing distinctly all the signals and motions of the fleet, and to be ready to replace such of the ships as may happen to be dismasted or driven out of the line, where all intervals must be properly

strengthened, and carefully filled up again without loss of time. The body of reserve is usually formed at the same time with the line, to prevent any irregularity that may happen on leaving any intervals or openings; yet the admiral may draw ships out of the line to form a body of reserve, according to the time and circumstances of his situation.

The oldest captain, after the senior officer who commands the body of reserve, ought to relieve the first, or close that part of the line which the disabled ship has been obliged to quit; and so on successively of the rest.

The commanding officer of the body of reserve will not be detached with the whole corps, unless on some pressing occasion, to fortify the line, where such reinforcement is absolutely necessary. It to defend one of the flag-officers of the three squadrons, he will be followed by the next senior officer of the reserve who was not before detached, in order to place themselves as seconds, the first ahead and the other astern of the flag they are to support, without any diminution of the honour of his own proper seconds at the same time, as they are only called in through necessity on that emergency, being not engaged before, and consequently better able to assist and support the admiral; their duty being likewise to exert their utmost efforts in attacking, or, if possible, in boarding, the enemy's flag ship, to force him to yield, except they are particularly ordered off to some other quarter or part of the line.

The admiral will sometimes order the whole body of reserve to reinforce one of the three squadrons of the fleet, as he may see occasion; which, when he does, the body must make all the sail it can, that each ship may place herself successively, the first in the first interval, the second in the second interval, and so on throughout. If a part only of the body of reserve is wanted, the proper signal will be made accordingly.

When the admiral has no further occasion for the body of reserve, he will make the proper signal for the ships composing it to resume their respective posts in the line, and these ships will repeat the signals.

If any captain in the fleet think he can board with success one of the enemy's ships, he will signify the same to the admiral by hoisting the boarding flag, together with his particular pendant, to be more plainly distinguished; the admiral in return will make the proper signal of approbation, or otherwise if he disapprove of the attempt, by letting fly that ship's particular pendant that she may observe the signal the better. Before the captain make the signal, he ought to consider well the ill consequences that might attend such an enterprise if he should fail or succeed; for the breaking of the order or disposition of the line, by quitting his post, may be of much greater disadvantage to the whole, than any advantage arising from his victory, except that over a flag-ship.

When the admiral makes the signal for his fleet to prepare for action, the fire-ships will at the same time get ready to their grappling-irons, fire-engines, &c. for boarding, and will likewise dispose all their combustibles into their proper channels of communication, &c. as soon as possible after the action begins: all which, when ready, they will take care to make known by signal to the particular division or squadron they belong to, and they of course will repeat the same to the admirals.

The fire-ships must be particularly careful in placing themselves out of the reach of the enemy's guns, which they may do abreast and under shelter of their own ships in the line, and not in the openings between the ships, unless to prevent any of the enemy's ships that should attempt to force through their line, when they must in such cases use their utmost efforts to prevent them. They ought always

The Battle to be very attentive to the admiral's signals, as well as those of the commanding officer of the particular squadron they belong to, that they may lose no time when the signal is made for them to act, which they must quickly answer by a signal in return.

113
The fire-ship in her way to the enemy to be assisted by the ship ahead of which she passes.

Although no ship in the line should be particularly appointed to lead down or protect the fire-ships, besides the frigates already ordered for that particular purpose; yet the ship ahead of which the fire-ship passes in her way to the enemy, whatever division she may belong to, is to escort her, and must assist her with a boat well manned and armed, as well as any other succour she may stand in need of: The two next ships to her must likewise give her all necessary assistance. The captain of a fire-ship is to consider, in short, that he is answerable for the event, in proportion as he expects to be honourably rewarded if he succeed in so daring and hazardous an enterprise.

114
Particular description of a naval engagement between two ships.

Since a general engagement of fleets or squadrons of men of war is nothing else than a variety of particular actions of single ships with each other, in a line of battle, it may not be improper to begin by describing the latter, and then proceed to represent the usual manner of conducting the former.

115
Divided into preparation, action, and repair.

The whole economy of a naval engagement may be arranged under the following heads: namely, the *preparation*, the *action*, and the *repair or refitting* for the purposes of navigation.

116
The preparation.

The *preparation* is begun by issuing the orders to clear the ship for action, which is repeated by the boatswain and his mates at all the hatchways or staircases leading to the different batteries. As the management of the artillery, in a vessel of war, requires a considerable number of men, it is evident that the officers and sailors must be restrained to a narrow space in their usual habitations, in order to preserve the internal regularity of the ship. Hence the hammocs, or hanging beds, of the latter are crowded together as close as possible between the decks, each of them being limited to the breadth of 14 inches. They are hung parallel to each other, in rows stretching from one side of the ship to the other, nearly throughout her whole length, so as to admit of no passage but by stooping under them. As the cannon therefore cannot be worked while the hammocs are suspended in this situation, it becomes necessary to remove them as quickly as possible. By this circumstance a double advantage is obtained: the batteries of cannon are immediately cleared of an encumbrance, and the hammocs are converted into a sort of parapet, to prevent the execution of small-shot on the quarter-deck, tops, and fore-castle. At the summons of the boatswain, *Up all hammocs!* every sailor repairs to his own, and, having stowed his bedding properly, he cords it up firmly with a lashing or line provided for that purpose. He then carries it to the quarter-deck, poop, or fore-castle, or wherever it may be necessary. As each side of the quarter-deck and poop is furnished with a double net-work, supported by iron cranes fixed immediately above the gunnel or top of the ship's side, the hammocs thus corded are firmly stowed by the quarter-master between the two parts of the netting, so as to form an excellent barrier. The tops, waste, and fore-castle, are then fenced in the same manner.

Whilst these offices are performed below, the boatswain and his mates are employed in securing the sail-yards, to prevent them from tumbling down when the ship is cannonaded, as she might thereby be disabled and rendered incapable of attack, retreat, or pursuit. The yards are now likewise secured by strong chains or ropes, additional to those by which they are usually suspended. The boatswain also provides the necessary materials to repair the rigging, wherever it may be damaged by the shot of the enemy, and to

supply whatever parts of it may be entirely destroyed. The carpenter and his mates, in the meanwhile, prepare shot-plugs and mauls, to close up any dangerous breaches that may be made near the surface of the water; and provide the iron-work necessary to refit the chain-pumps, in case their machinery should be wounded in the engagement. The gunner with his mates and quarter-gunners is busied in examining the cannon of the different batteries, to see that their charges are thoroughly dry and fit for execution; to have every thing ready for furnishing the great guns and small arms with powder as soon as the action begins; and to keep a sufficient number of cartridges continually filled, to supply the place of those expended in battle. The master and his mates are attentive to have the sails properly trimmed, according to the situation of the ship; and to reduce or multiply them, as occasion requires, with all possible expedition. The lieutenants visit the different decks, to see that they are effectually cleared of all encumbrance, so that nothing may retard the execution of the artillery; and to enjoin the other officers to diligence and alertness, in making the necessary dispositions for the expected engagement, so that every thing may be in readiness at a moment's warning.

When the hostile ships have approached each other to a competent nearness, the drums beat to arms: The boatswain and his mates pipe, *All hands to quarters!* at every hatchway: All the persons appointed to manage the great guns immediately repair to their respective stations: The crows, handspikes, rammers, sponges, powder-horns, matches, and train tackles, are placed in order by the side of every cannon: The hatches are immediately laid, to prevent any one from deserting his post by escaping into the lower apartments: The marines are drawn up in rank and file on the quarter-deck, poop, and fore-castle: The lashings of the great guns are cast loose, and the tompons withdrawn: The whole artillery, above and below, is run out at the ports, and levelled to the point blank range, ready for firing.

The necessary preparations being completed, and the officers and crew ready at their respective stations to obey the order, the commencement of the action is determined by the mutual distance and situation of the adverse ships, or by the signal from the commander in chief of the fleet or squadron. The cannon being levelled in parallel rows projecting from the ship's side, the most natural order of battle is evidently to range the ships abreast of each other, especially if the engagement is general. The most convenient distance is properly within the point blank range of a musket, so that all the artillery may do effectual execution.

The combat usually begins by a vigorous cannonade, accompanied with the whole efforts of the swivel-guns and the small arms. The method of firing in platoons, or volleys of cannon at once, appears inconvenient in the sea-service, and perhaps should never be attempted unless in the battering of a fortification. The sides and decks of the ship, although sufficiently strong for all the purposes of war, would be too much shaken by so violent an explosion and recoil. The general rule observed on this occasion throughout the ship, is to load, fire, and sponge the guns with all possible expedition yet without confusion or precipitation. The captain of each gun is particularly enjoined to fire only when the piece is properly directed to its object, that the shot may not be fruitlessly expended: The lieutenants, who command the different batteries, traverse the deck to see that the battle is prosecuted with vivacity; and to exhort the men to their duty. The midshipmen second these injunctions, and give the necessary assistance, wherever it may be required, at the guns committed to their charge. The

Battle The gunner should be particularly attentive that all the artillery is sufficiently supplied with powder, and that the cartridges are carefully conveyed along the decks in covered boxes. The havoc produced by a continuation of this mutual assault may be readily conjectured by the reader's imagination: battering, penetrating, and splintering the sides and decks; shattering or dismounting the cannon; mangling and destroying the rigging; cutting afunder or carrying away the masts and yards; piercing and tearing the sails so as to render them useless; and wounding, disabling, or killing the ship's company! The comparative vigour and resolution of the assailants to effect these pernicious consequences in each other, generally determine their success or defeat: we say generally, because the fate of the combat may sometimes be decided by an unforeseen incident, equally fortunate for the one and fatal to the other. The defeated ship having acknowledged the victory by striking her colours, is immediately taken possession of by the conqueror, who secures her officers and crew as prisoners in his own ship; and invests his principal officer with the command of the prize until a captain is appointed by the commander in chief.

The engagement being concluded, they begin to repair: the cannon are secured by their breechings and tackles with all convenient expedition. Whatever sails have been rendered unserviceable are unbent; and the wounded masts and yards struck upon deck, and fished or replaced by others. The standing rigging is knotted, and the running-rigging spliced wherever necessary. Proper sails are bent in the room of those which have been displaced as useless. The carpenter and his mates are employed in repairing the breaches made in the ship's hull, by shot-plugs, pieces of plank, and sheet-lead. The gunner and his assistants are busied in replenishing the allotted number of charged cartridges, to supply the place of those which have been expended, and in refitting whatever furniture of the cannon may have been damaged by the action.

Such is the usual process and consequence of an engagement between two ships of war, which may be considered as an epitome of a general battle between fleets or squadrons. The latter, however, involves a greater variety of incidents, and necessarily requires more comprehensive skill and judgement in the commanding officer. A short account of which also we shall next proceed to lay before our readers.

When the admiral or commander in chief of a naval armament has discovered an enemy's fleet, his principal concern is usually to approach it, and endeavour to come to action as soon as possible. Every inferior consideration must be sacrificed to this important object, and every rule of action should tend to hasten and prepare for so material an event. The state of the wind, and the situation of his adversary, will in some measure dictate the conduct necessary to be pursued with regard to the disposition of his ships on this occasion. To facilitate the execution of the admiral's orders, the whole fleet is ranged into three squadrons, each of which is classed into three divisions, under the command of different officers. Before the action begins, the adverse fleets are drawn up in two lines, as formerly described. As soon as the admiral displays the signal for the line of battle, the several divisions separate from the columns, in which they were disposed in the usual order of sailing, and every ship crowds sail to get into its station in the wake of the next ahead; and a proper distance from each other is regularly observed from the van to the rear. The admiral, however, will occasionally contract or extend his line, so as to conform to the length of that of his adversary, whose neglect or inferior skill on this occasion he will naturally convert to his own advantage, as well as to prevent his own

line from being doubled; a circumstance which might throw **The Battle** his van and rear into confusion.

When the adverse fleets approach each other, the courses are commonly hauled up in the brails, and the topgallant-sails and stay-sails furled. The movement of each ship is chiefly regulated by the main and foretop sails and the jib; the mizen top-sail being reserved to hasten or retard the course of the ship; and, in line, by filling or backing, hoisting or lowering it, to determine her velocity.

The signal for a general engagement is usually displayed when the opposite fleets are sufficiently within the range of point blank shot, so that they may level the artillery with certainty of execution, which is near enough for a line of battle. The action is begun and carried on throughout the fleet in the manner we have already described between single ships. The various exigencies of the combat call forth the skill and resources of the admiral to keep his line as complete as possible when it has been unequally attacked; by ordering itips from those in reserve to supply the place of others which have suffered greatly by the action; by directing his fire-ships at a convenient time to fall aboard the enemy; by detaching ships from one part of the line or wing which is stronger to another which is greatly pressed by superior force, and requires assistance. His vigilance is ever necessary to review the situation of the enemy from van to rear; every motion of whom he should, if possible, anticipate and frustrate. He should seize the favourable moments of occasion, which are rapid in their progress, and never return. Far from being disconcerted by any unforeseen incident, he should endeavour, if possible, to make it subservient to his design. His experience and reflection will naturally furnish him with every method of intelligence to discover the state of his different squadrons and divisions. Signals of inquiry and answers, of request and assent, of command and obedience, will be displayed and repeated on this occasion. Tenders and boats will also continually be detached between the admiral and the commanders of the several squadrons or divisions.

As the danger presses on him, he ought to be fortified by resolution and presence of mind; because the whole fleet is committed to his charge, and the conduct of his officers may in a great degree be influenced by his intrepidity and perseverance. In short, his renown or infamy may depend on the fate of the day.

CHAP. IX. *Manœuvres performed by adverse Fleets when in sight of each other.*

To dispute the weather-gage with the enemy.—When the enemy is to windward, and it is wished to gain the weather-gage of him, the fleet to leeward should avoid extending itself the length of the enemy's line, in order to oblige them to edge down upon theirs, if they intend to attack them; which will be a mean, if they still persist in doing so, of losing the advantage of the wind.

It is impossible for a fleet to leeward to gain to windward so long as the enemy keep their wind, unless a change happens in their favour: therefore all that a fleet to leeward can do, must be to wait with patience for such a change; which they will undoubtedly avail themselves of, as well as any mistake or inadvertency the enemy may commit in the mean time. And as long as the fleet to leeward does not extend its line the length of the enemy's, it will be impossible for the latter to bring them to action without running the hazard, by bearing down, of losing the advantage of the wind, which both fleets will be so desirous of preserving.

Manœuvres performed by adverse fleets when in sight of each other

Manœuvres performed by adverse fleets when in sight of each other

Hence, that an admiral may benefit by the shifts of the wind that frequently happen, he must in a manner force them: which will not appear so extraordinary to officers of any experience, who know what winds reign most on the coast, or off the head-lands, where they may expect an enemy; and though an admiral may be sometimes out in his conjecture, he also as often succeeds so happily as to gain the advantage of his enemy. The disposition of projecting head lands, and the setting of tides or currents, also contribute greatly towards gaining the wind of the enemy.

Again, the fleet to windward ought to keep that to leeward as much as possible always abreast of it; because, by doing so, they will preserve the advantage they have, unless the wind changes much against them. They should force them likewise to keep their wind, unless they think it more prudent not to engage; but when that is the case, they should keep entirely out of sight.

The following observations, with respect to the shifting of the wind, are given by M. Bourdè de Villehuet: 1. If the weather fleet be in order of battle, and the wind draw ahead, the lee fleet, if they be ahead and in order of battle, ought to box off on the same tack as before, in order to tack in succession in the wake of one another, to restore the order of battle; drawing at the same time a great deal to windward. This manœuvre may even be the means of weathering the enemy, if the wind should shift much; for they have no other method to regain the order of battle, without losing much ground: though they will always lose a great deal with respect to the position of the enemy to leeward.

2. If the lee fleet be astern, and the wind shifts aft while they are on the contrary tack with the enemy in order of sailing on one line, the lee fleet ought to tack or veer altogether, and at the same instant; because this shift of wind will be ahead for all the ships in respect to their tacks then on board, and astern in respect to the order of battle. When the van ship is full on the other tack, as well as all the rest in their former order of battle, she shall haul by the wind, while the rest of the fleet run large on their first line of battle as many points as the wind has shifted aft, to get into her wake successively, and restore the order of battle while approaching the enemy; by which they gain the wind of him, or else double him if the shift has been great; for the only means they have of restoring the line of battle is by the van ship hauling by the wind, and the rest coming into her wake in succession. If the shift of the wind was four points, the fleet to leeward would be obliged still to perform the same manœuvre, that they might go about, after a certain time, successively to windward of the enemy, who could only in the mean time have tacked all together, to bring their fleet suddenly in a line of battle on the other board.

If, when the wind shifts aft, the lee fleet is astern in order of battle, and the enemy be on the other tack in the order of sailing, the leading ship must haul close to the wind immediately, while the other vessels will, in succession, bear away as many points as the wind has shifted, in order to perform the same manœuvre and restore the line of battle. By observing this mode of manœuvring, you will approach the enemy, and gain as much to windward of him as possible, or get even the weather-gage of him entirely, if the wind has shifted considerably. The rear ship of the fleet to leeward may immediately keep close to this new wind on the same board, while all the rest of the fleet, after having tacked together and at the same time, will come and place themselves close by the wind in her wake, where they are again to tack successively, in order to follow their rear ship, which is now become the leader, and which may break the ene-

my's line, or at least gain the wind of him. But, to be able to go through this evolution, you must have nothing to fear from the enemy; for the fleet will be obliged to go about twice before the order of battle can be restored. The weather fleet ought to keep their wind as close as possible, holding the enemy always exactly to leeward of them, by keeping on the same tack as he; and if the wind shifts a little, and becomes favourable to the enemy which is to leeward, the weather ships are then to keep exactly their wind, without caring for the preservation of the line, unless the two fleets be very near one another.

To force the enemy to action.

1. When the enemy has the weather-gage.—When two adverse fleets are in sight of each other, an engagement is almost unavoidable: For since it may be presumed that the fastest sailing ships of the one fleet will sail faster than the slowest sailing vessels of the other fleet, hence the fleet that is in pursuit will gain upon the other. The lee fleet, which is wishing to bring on an engagement, must therefore keep always on the same tack with the weather fleet; and taking care to keep them so exactly abreast as to prevent the least danger of losing sight of them, and hence be ready to take the advantage of the first favourable shift of wind to make the attack. Night is certainly the time when an alteration of the course may be best attempted. But the lee fleet is to have frigates on the look-out; which, by signals, will continually give notice of the manœuvre and course of the retreating fleet to windward; which, by these means, is always exposed to be pursued without being able to get off unseen, and must sooner or later be compelled to come to action, unless they can get into some port, or a gale of wind should come to rescue them by dispersing both fleets, and thus furnish the means of retreating in a storm.

2. When the enemy is to leeward.—If the lee fleet keep close to the wind in the order of battle, the fleet to windward is to stand on in the same manner till it is abreast of the enemy, ship to ship, when they are all together, and at the same time, to bear away, and steer exactly so as to bring their respective opponents, in the adverse line, on the same point of the compass with them; observing the principles of chasing, which are to be observed by every chaser to windward. Thus the fleets will be near enough to begin the action, in presenting the bow of each ship to her opponent in the order of sailing, which will be easily changed for the line of battle, by all the ships hauling close to the wind together, in the moment which precedes the beginning of the action.

If the fleet to leeward be inclined to engage, it might bring to, to prevent losing time; as, by this manœuvre, less time will be requisite for the weather fleet to join them: then they will fill as soon as the action begins, because it is more favourable to a lee line to be advancing ahead; since, if a ship be disabled in the weather line (which is obliged to follow with the topsails full), she will infallibly drop, and run foul of the next vessel astern of her, covered with fire and smoke, which may be productive of great disorder.

As the lee fleet fills and stands on close by the wind, it is necessary that the weather-line should be abreast and parallel to the other before they bear away to come within the requisite distance for action, in order that the van ship of the weather fleet should always keep to windward of the leading ship of the lee line, and be guarded against such a shift of wind as might come ahead; which would not be the case if they were astern of the van ship in the lee fleet; which, as well as the rest of the line, would be able then to double them to windward, by tacking in succession.

Another reason for the weather line being right abreast of the enemy to leeward, and for every ship steering on the same point in approaching her opponent in the leeward line

of battle, is, that the fleets may be placed exactly parallel to each other; for, as the weather line must not be astern, because of the risk of the wind coming more forward, neither must they be ahead of the line to leeward, in case the wind should come aft; for then the lee fleet, keeping close by the wind in the wake of their leading ship, might, by this shift, be as far to windward as the opposing fleet, or even get the weather gage of them. But if the weather fleet keep exactly abreast of the other, they will always be in a situation to preserve their advantage without exposing themselves. It is, notwithstanding, that those ships keeping more away than the line to leeward will find themselves, when come within gun-shot, in a very disagreeable situation with respect to the enemy's ships, which will have it then in their power to rake them as they bear down. This may occasion much disorder among the ships of the weather line, which, for that moment, have it not in their power to fire their whole broadside at the enemy, who has the advantage of beginning the action.

If the lee fleet bear away four points to move their order of battle on the other tack and avoid the action, sailing off in succession in the wake of the van ship, the weather line, by bearing away all together eight points, cannot fail, as both fleets are supposed to sail equally, to pass through the middle of their line, and force them to fight with disadvantage, if their extent be double the distance between the two fleets. If the extent of the fleet be less than the above limitation, then the weather fleet will divide the lee fleet more unequally; and if the distance between the fleets be considerable, the weather fleet will not be able to break through the line.

If the lee fleet bear away four points all together, being of equal extent with the fleet to windward, and their distance from each other equal to half the length of one of the lines; should the weather fleet bear away at the same time eight points, they will approach very near the sternmost of the retreating fleet; but they will not have it in their power to cut off any part of that fleet, even with an equality of sailing: so that the only advantage gained by this manœuvre will be an ability of attacking the rear, and bringing it to action.

If the van ship and the rest of the weather fleet had a sufficient velocity to keep the centre ship of the lee line on the same point of bearing; in that case the leading ship may break through the enemy's line about the middle ship of the centre division: for, supposing the fleets in order of battle, on the starboard tack, steering east, with the wind at south-south east, being at two leagues distance from each other, both the lines being four leagues in extent; then the lee line bearing away all together four points, will run north-east, while the fleet to windward, bearing away all together eight points, will steer north; the van ship of which will keep the centre division of the lee line on the point of bearing north-west. As she is supposed to be able to continue in this position, it follows, that the van of the weather line must close the centre of the flying line to leeward, after having run four leagues. The time and distance necessary to cut off a retreating fleet may always be known according to the last supposition. Should the lee fleet get upon the other tack and run large, still preserving the order of battle, they will be still sooner closed and forced to action by the weather fleet, who have only to keep away from eight to nine points on the same tack, or run right before the wind.

The weather fleet can always force the lee one to action, whatever movements they make; for, if they run with the wind right aft in order of battle, they cannot, supposing an equality of sailing, avoid being closed or broken nearly about the centre by the weather line, which has only to steer two

points on each tack nearer the wind than the retreating fleet. So that the rear of the weather fleet having bore away no more than eight points, will be found at the end of a certain time to have approached extremely near the centre of the retreating fleet; and, in a short time more, will be able to bring their rear to action. The weather fleet have yet another advantage; because, as their ships have the wind on the quarter, they sail with greater celerity than those of the lee fleet, which run before the wind. The lee fleet being absolutely determined to fly, has therefore no other expedient left to prolong time but to combat in the order of retreat right before the wind, or on the same course as the pursuing fleet; for other advantages are not to be relied on, if pursued by a victorious foe.

If, from all that has been said, it results that it is not possible for a fleet of equal force to avoid an action, how then must it be with one much inferior? The more numerous has nothing to do but to form a detachment of superior sailers, which will gain upon the lee fleet and begin the action, while some others approach to finish it. Whence we may conclude, that when in presence of too powerful an enemy, it will never be possible to avoid an action if he is determined to come to one.

To avoid coming to Action.

1. When the enemy is to windward.—The lee fleet, which is wishing as much as possible to avoid an engagement, ought to form the order of retreat to fly from the enemy if they are in view of him, and run on the same tack as their chaser. But if he is yet out of sight, and they have intelligence of his approach by their frigates which are looking out, they may run large from the hostile fleet, without confining themselves to keep the wind exactly aft, unless they be in the order of retreat. There are, however, circumstances when the lee fleet may run with the wind aft, without assuming the order of retreat; as, for example, when they wish to gain time, or resolved to engage the enemy, if they still continue to pursue them. But except on such extraordinary occasions, a fleet should not fly before the enemy without being in the order of retreat, as the rear is then in the best situation to extricate themselves in case of accident.

2. When the enemy is to leeward.—The weather fleet can scarcely ever be forced to engage; because it can always continue on that tack which increases its distance from the enemy, by standing on one tack, while the enemy continues upon the other. If the wind was to remain on the same point of the compass for any considerable space of time, it would be very easy for the fleet to windward to keep in sight of the enemy, without being under any apprehensions of being forced to come to action; but the inconstancy of the wind obliges the most experienced admiral to avoid meeting the enemy when he thinks it improper to engage him.

To double the Enemy, or to bring a Part of his Fleet between two Fires.

1. When the enemy has the weather-gage.—The fleet which attempts to double an enemy ought always to be superior to him in number of ships. The lee fleet ought to endeavour to range exactly abreast of, and parallel to, the weather fleet, so that the van or rear may extend beyond their line, in order to over-reach them, by tacking in succession to double to windward their van or rear, and bring them between two fires. Provided this manœuvre be properly executed, it will be impossible for the ships in the weather line, thus pressed, to continue long in their ports; for there is no vessel closely attacked by two others of equal force which can long resist being overcome, since it is always in the power of one of them to get into such a position

Manœuvres performed by a fleet when in sight of each other.

123 To avoid an action, the enemy being to windward.

124 The enemy being to leeward.

Manœuvres performed by adverse fleets when in sight of each other.

tion as to be able, without much danger on her side, to destroy the enemy in a very short time. But whether the most advantageous evolution is to double the van or the rear, is necessary to be considered; for there is so considerable an advantage attending each of these evolutions, that either of them may in a very little time determine the fate of the battle.

As, in the present case, the enemy is supposed to be to windward, either their van or rear may be doubled; but the van may with the greatest facility, because, if they are engaged by the ships abreast of them, those which are advanced ahead will be able, by making all sail, to get on the perpendicular to the direction of the wind with the van of the enemy, and tack in succession to gain the wind of them on the other board, thus keeping them to leeward; and when they are come sufficiently to windward, they are again to go about, in order to keep the two headmost ships of the enemy's line continually under their fire. If there be two or three ships to tack in succession and gain the wind of the enemy, they may edge down on the van of the weather line at pleasure, keeping themselves a little to windward of it; and as that van is already engaged by the other ships abreast on the other side, she must necessarily be soon disabled. If they bear away, they must drop upon the line with which they are engaged to leeward, while the ships to windward still continue to cannonade them. If they attempt going about, in order to attack more closely the ships to windward, they will be raked, while in stays, by their opponents to leeward and to windward, who enfilading them with whole broadsides, which they cannot return, must absolutely complete their disorder. If they make sail, in order to frustrate the design of the ships inclined to double, those with which they are engaged abreast to leeward have only to perform the same manœuvre, and keep them under their fire; while the others, after having harassed them as much as possible, will do their best to perform the same manœuvre on the succeeding ships.

The captains declined to double the enemy ought to be men of known ability, as well as of approved courage. They should not be ordered upon that service but in weather fit for sailing at the rate of three knots an hour at least; and, for the greater promptitude and certainty of success, none but the best going ships are to be employed.

If any of the ships in the van of the weather-line happen to be disabled in their masts or yards, as will most probably be the case after having been between two fires, they will drop astern and run foul of the next which follows, and these again of their subsequent comrades; at last, disorder will become prevalent, by ships running foul of each other, or manœuvring to avoid the same accident: so that the order of battle will be broken; while, on the other hand, the line to leeward is preserved with all the advantage possible. The ships which have gained the wind of the enemy will, by continuing their manœuvre, augment the confusion; engaging, however, no more than they like; and if, by chance or misfortune, they should be crippled, it will not certainly be an easy matter for them to extricate themselves. But as they may, on the other tack, drop astern to windward of the enemy's line, or veer again like him, they must extricate themselves as well as they can, and always advantageously enough; by doubling the van, they are able to throw it into disorder.

If the rear of the lee fleet be extended beyond the sternmost ship of the weather-line, they will be obliged, if they want to double the rear of the enemy to windward, to make sail and tack in succession; in which manœuvre the headmost ship of those destined for this service is to go about first; then, continuing to keep up a brisk cannonade as they come to the wind, they will go and leave about again a little to windward of the rear of the enemy, in order to bring their

stern ships between two fires: and should they have the good fortune to oblige them to bear away, they must go on successively from one ship to another, as long as they find they succeed in forcing them to give way. Should disorder take place in the rear of the weather fleet, it will not be near so prejudicial to the enemy as if it had happened in the van; on the contrary, it may turn out to be of some advantage to them. But the vessels combating to windward can easily withdraw from the fight, by backing astern when they find themselves too hard pressed.

2. When an enemy is to leeward.—The ships of the weather-line having extended their van beyond that of the lee-line, are to veer, in order to bring the headmost ships of the enemy's line between two fires. But, let them do as they will, there never can result so much advantage from this manœuvre as when doubling a fleet to windward, because the disabled ships can always veer with facility. True it is, they cannot sail becoming at the same time the prey of the enemy; for both those which have doubled them, and those with which they are engaged abreast in the weather-line, will always have it in their power jointly to press as close as they think proper.

If the ships which have doubled the van of the lee fleet, with which they are engaged, be disabled, they will be obliged, as they cannot make sail, to pass along the lee line; and they cannot escape being totally destroyed if they do not bear away before the wind, to get out of gun-shot; during which manœuvre they cannot avoid being still in a very disagreeable situation.

Should the sternmost ships of the weather fleet be disabled in doubling the enemy's rear, they have only, if they want to extricate themselves, to drop astern, and let the two fleets advance ahead; and after having refitted themselves, they will reassume their ports.

To avoid being doubled.

1. The enemy being to windward.—For this purpose, it has been proposed to extend the line, by leaving a greater interval between the ships towards the centre than in the van or rear; but in this case the line runs the risk of being divided, unless prevented by a corps de reserve, consisting of a few ships of the line and fire-ships. It has also been proposed as a general rule, that the flag-officers of the lee fleet should oppose themselves to those of the enemy; by which means several of the enemy's ships will be rendered useless in the intervals. This method has, however, its inconveniences; as sometimes the van and rear of each division may be exposed to the fire of two ships at the same time: nor is the last division out of danger of being doubled. In order to remedy these defects, the larger ships ought to be placed in the van and rear of each division; and the whole fleet must regulate its sailing in such a manner that the rear of the enemy may not be astern of the rear of the last division.

Other methods have been proposed to avoid being doubled; as, that each squadron of the lee fleet should attack its corresponding squadron in the weather fleet; each division of the lee fleet, however, extending its line far enough to prevent the enemy from leaving any ships astern of it, but rather ahead. It has also been proposed, that the lee fleet should extend its line as long as the enemy's line. This method will be advantageous for the lee fleet, provided it is composed of ships of superior force, though fewer in number, than the enemy. In other cases, it is probably the worst method that can be followed by the lee fleet, as it gives the enemy's fleet all the advantage it can desire of exerting its whole force upon the inferior line.

2. When the enemy is to leeward.—The weather fleet is to keep astern of the enemy, so that the van of the weather fleet may be opposed to and attack the enemy's centre:

Of Chasing.

hence the enemy's van will become useless for some time; and if it should attempt to tack and double upon the weather fleet, much time will be lost in performing that evolution; and it also runs the risk of being separated by the calm which generally happens in the course of a sea-engagement in consequence of the continual discharge of cannon. A considerable interval might also be left between the centre and van, provided the necessary precautions be taken to prevent the van from being cut off.

To force the enemy's line.

This is a manœuvre which the lee fleet may execute to gain the advantage of the wind. It is performed by the van ship, if within gun-shot, tacking when she and the centre ship of the weather line are on a perpendicular to the direction of the wind; then all the lee fleet tack in succession, and thus may pass through the enemy's line, or perhaps a little more towards the enemy's van, and go about again in succession to windward of him. But as he will not be long, without doubt, before he performs the same manœuvre, he will thus be able to remain the wind, if he be not forced to give way before his evolution is finished. The enemy to windward may even cause his van ship to tack, as well as the rest of the van squadron to follow in succession, as soon as the leading ship of the lee fleet shall have passed through his line and be ready to go about; by which means he will bring them between two fires. This manœuvre, well executed, might perhaps give no little trouble to the ship attempting to force the line.

This evolution may be performed with advantage, if, by some accident or fault in the manœuvring, the centre division of the weather-line be separated from their van or rear. For example, when the centre division to windward is encumbered with disabled ships, then the ships of the centre division of the fleet to leeward, having all sails set, are to tack in succession, and force with promptitude through the weather fleet, leaving their own van division to engage that of the enemy on the other tack.

To prevent the line being forced.

When the ships of the fleet go about in succession, in order to force the weather line, the whole line to windward is to tack together, and at the same time to get upon the same board as the lee fleet; then that fleet will neither be able to traverse nor join them. To perform this evolution with advantage, it will be requisite to permit some of the van ships of the lee fleet to pass to windward; then the weather fleet must go all about rapidly, in order to put and keep them between two fires: thus may these ships be destroyed without their own fleet being able to give them any effectual assistance.

It is easy to perceive, from what has been said, that there is little occasion to fear being traversed, as such a manœuvre may turn out to be more prejudicial than advantageous to those who perform it. Nevertheless, it may and ought to be put in practice when the weather fleet leave such vacancies between their divisions as to allow some ships of the lee fleet to be inactive. In this case, the ships which are without opponents abreast of them are made to tack, with all sails set, in succession, and pass through these intervals in the weather line, in order to double the centre division, or any other part of it, and bring it between two fires.

CHAP. X. Of Chasing.

1. IN the case of single ships.—It is scarcely necessary to observe, that the ship which gives chase is usually called the *chaser*, and that which is pursued is called the *chase*. Unless the chaser be the fastest sailing vessel of the two, it is generally supposed that she will seldom or never come up

with the chase: but we have heard experienced officers say, that a chasing ship, sailing equally fast, in other circumstances, will gain on her chase; because she has an object to steer by, whereas the chase cannot steer so nicely by the compass. In what follows, however, we shall suppose the chaser to be the fastest sailer.

When the chase is to windward, it is evident that as soon as she perceives a strange ship which she takes for an enemy, she will haul her wind, in order to prolong the chase, as otherwise her retreat would be soon cut off. The chaser then stands on also nearly close-hauled until he has the chase on his beam; he then tacks, and stands on close-hauled until the chase is again on his beam, and then retacks. In this manner he continues tacking every time he brings the chase perpendicular to his course on either board: and by manœuvring in this manner, it is very certain that the chaser will, by the superiority only of his sailing, join the other in the shortest time. For since the chaser tacks always as soon as the chase is perpendicular to his course, she is then at the shortest distance possible on that board; and since the chaser is supposed to be the fastest sailer, these shortest distances will decrease every time the chaser tacks. It is therefore of advantage to the chase to keep constantly on the same course, without losing her time in going about; as tacking cannot be so favourable to her as to her adversary, whose sailing is superior. If the chaser should so little understand his profession as to stand on a long way, and tack in the wake of the chase, the best thing she can do is to heave in stays, and pass to windward of him on the other tack, unless she would have a superiority in going large; for if the chaser persists in tacking in the wake of the other ship, it is an unquestionable fact that the chase will be very much prolonged.

The chase being to leeward, the chaser is to steer that course by which he thinks he will gain most upon her. If after having run a short time, the chase is found to draw more astern, the chaser is then to bear away a little more; but if the chase draws ahead, the pursuer is to haul up a little, and by this means the course may be so regulated that the chase may always bear on the same point of the compass, and then the chaser will get up with the chase in the shortest time possible; for were any other course steered than that which keeps the chase always on the same point, the chaser would then be either too far ahead, or too far astern; and hence the chase would be prolonged.

The chase ought to run upon that course which will carry her directly from the chaser; and, in general, to consult which is her best trim with respect to the wind, that she may move with the greatest rapidity possible from the ship which pursues her; for some vessels have more advantage in going large than others, some with the wind right astern, and others again are to be found that sail best close-hauled; so that attention should be paid by the officer to the known qualities of his ship, in order to take the most advantageous direction capable to effect a retreat.

Another method has also been proposed for chasing a ship to leeward, that is, by constantly steering directly for the chase: In this case, the tract the pursuer describes thro' the water is called the line or *curve of pursuit*. In order to illustrate this, let A (fig. 54.) represent the pursuer, and B the chase directly to leeward of it, and running with less velocity than the pursuer, in the direction BC, perpendicular to that of the wind. Now, to construct this curve, let Bb be the distance run by the chase in any short interval of time; join A b, and make A 1 equal to the distance run by the pursuer in the same time. Again, make bc, cd, de, ef, &c. each equal to B; join 1c, and make 1 2 equal to A 1; join 2 d, and make 2 3 equal to A 1; in like manner pro-

132 The chase being to windward.

133 The chase being to leeward.

134 Curve of Pursuit.

Of Chasing.

ceed until the two distances carried forward meet as at C, and a curve described through the points A, 1, 2, 3, &c. will represent nearly the curve of pursuit; and the less the interval A1 is taken, the more accurate will the curve be formed. In this particular case the length of the distance BC may be found as follows, provided the distance AB and the proportional velocities of the two ships be known.

Let the velocity of the chase be expressed by a fraction, that of the chaser being unity. Multiply the given distance AB by this fraction, and divide the product by the complement of the square of the same fraction, and the quotient will be the distance run by the chase E. Let AB, the distance of the chase directly to the leeward of the pursuer, be 12 miles, and the velocity of the chase three-fourths of that of the chaser; the distance to be run by the chase before she is overtaken is required?

Now $\frac{12 \times \frac{3}{4}}{1 - \frac{9}{16}} = \frac{9}{\frac{7}{16}} = 9 \times \frac{16}{7} = 20 \frac{2}{7}$ miles; and since the

velocity of the pursuer to that of the chase is as 4 to 3; hence the distance run by the chaser will be $= 20 \frac{2}{7} \times \frac{4}{3} = 27 \frac{1}{7}$ mile.

As the pursuer alters his course at every point, and since it is presumed his ship will sail better with the wind in one direction, with respect to her course, than in another, her velocity will therefore be different at different points of the course. Thus suppose her to sail faster when the wind is upon the quarter, her velocity will constantly increase until she has attained a certain point, and then it will decrease: hence in real practice this curve will not be precisely the same as above, and of course the measure of BC will differ a little from the preceding determination. The investigation of the foregoing rule is in Simpson's Fluxions, p. 516; and the application of the curve of pursuit in Sir George Pococke's engagement in the East Indies in the year 1758, is given in Clerk's Essay on Naval Tactics, p. 160. It must be confessed, however, that Mr Simpson's investigation, though a pretty specimen of mathematical investigation, proceeds on certain physical assumptions, which are by no means sanctioned by experience. See what has been said of these assumptions and principles in the articles *RESISTANCE of Fluids*, and *SEAMANSHIP*.

Hitherto we have considered chasing in the case of single

ships only; the same rules are also applicable to fleets: we shall, however, subjoin the following remarks with respect to chasing as practised by fleets.

If the whole fleet is to give chase, the admiral will make the proper signal; and then each ship will instantly make all the sail possible. If the retreating fleet is not much inferior to the other, a few of the fastest sailing vessels only are to be detached from the victorious fleet, in order to pick up any stragglers or those ships which may have fallen astern; and the remaining part of the fleet will keep in the same line or order of sailing as the retreating fleet, so that they may, if possible, force them to action. But if the retreating fleet is much inferior, the admiral of the superior fleet will make the signal for a general chase; and then each ship will immediately crowd all the sail possible after the retreating fleet; or, if the chase be still less numerous, the admiral will detach one of the squadrons of his fleet, by hoisting the proper signal for that purpose, and he will follow with the remainder of the fleet. The squadron that chases, or the cruisers detached from the fleet, should be very careful not to engage too far in the chase for fear of being overpowered; but at the same time to endeavour to satisfy themselves as much as may be in their power with regard to the object of their chase. They must pay great attention to the admiral's signals at all times; and in order to prevent separation, they should collect themselves before night, especially if there be any appearance of thick or foggy weather coming on, and endeavour to join the fleet again. The ships are diligently to observe when the admiral makes the signal to give over chase; that each regarding the admiral's ship as a fixed point, is to work back or make sail into her station, to form the order or line again as expeditiously as the nature of the chase and the distance will permit.

When a fleet is obliged to run from an enemy who is in sight, it is usual to draw up the ships in that form or order, called the *order of retreat*, which has been already described; and the admiral, when hard pursued, without any probability of escaping, ought, if practicable, to run his ships ashore, rather than suffer them to be taken afloat, and thereby transfer additional strength to the enemy. In short, nothing should be neglected that may contribute to the preservation of his fleet, or prevent any part of it from falling into the hands of the conqueror.

PART II. NEW SYSTEM OF NAVAL TACTICS.

CHAP. I. *View of De Grenier's Tactics.*

WE have now laid before our readers as comprehensive a view as the limits prescribed to such articles will permit of the various evolutions usually practised by fleets in naval war. Though we have transcribed liberally from the most approved writers on the subject, we doubt not but the scientific officer will perceive that we have compiled awkwardly and unskillfully; but we are not seamen ourselves; and the generosity of BRITISH officers will pardon the blunders into which mere literary landmen could hardly avoid falling. The young seaman, who has the noble ambition to excel in his profession, will consult the authors whom we have mentioned in our introduction, in whose works he will find our deficiencies amply supplied; but that the present article may be as complete as we can make it, a view must be given of the system of tactics proposed by the Viscount de Grenier and our countryman Mr Clerk; because, whether these systems shall ever be adopted or not, they are the offspring of ingenuity, and as such merit attention.

OF all the orders, that of battle is the most important in naval tactics; but the order of battle which was first formed in the last century by the Duke of York, and has been continued in use to the present day, the Viscount de Grenier thinks extremely defective. Various causes may conspire to render the task of breaking it not difficult. Its great extent must make it no easy matter for the admiral to judge what orders are proper to be issued to the ships stationed in its extremities; whilst his signals, however distinctly made, are liable to be mistaken by the commanders of those ships. The extremities of a long line are necessarily defenceless, especially if it be to leeward; because, after it is formed, the enemy may throw himself with a superior number on its van or rear, and put that squadron to flight before assistance can be sent to it from the other squadrons. These defects the Viscount de Grenier thinks may be remedied by never

new of
Tactics.
8
e Vil-
le
icr.

never presenting to the enemy any part of a fleet without its being flanked; so that were the commander of the adverse fleet to attack those parts which hitherto have been reckoned weakest, he might find himself defeated when he looked for conquest. With this view he proposes a new order of battle; in which the fleet, composed of three divisions, instead of being drawn up in one line as usual, shall be ranged on the three sides of a regular lozenge, formed by the intersecting of the two close-hauled lines. It is obvious that one of the divisions of a fleet ranged in this manner will always be formed in the order of battle; whilst the two others, resting upon the first ship ahead and the last stern of that division, will be formed on the close-hauled line opposite, and will stand on chequerwise on the same tack with the ships which are in the line of battle, serving to cover the headmost and sternmost of those ships, and thereby prevent the enemy from penetrating the line or doubling the rear.

Our author thinks it a great mistake, though very generally fallen into, that the weather-gage is of any advantage to a fleet equal in force to its enemy and willing to engage. To him the great art of war at sea appears to consist in drawing or keeping to windward a part of the adverse fleet, and collecting all one's forces against that part; and it is chiefly to effect this purpose that he proposes his new system of tactics. The reader, who would understand his principles, must never lose sight of this evident truth, that each ship of a fleet necessarily occupies at all times the centre of an horizon; which the author divides into two unequal parts, calling the greater the *direct and graduated space*, and the less the *indirect, crossed, and ungraduated space*. The reason of these appellations is, that on the greater segment of the horizontal circle there are twenty different points, which may be marked by degrees from one of the close-hauled lines to the other, and to which a ship may sail from the centre by so many direct courses without tacking; whereas to the other twelve points, including that from which the wind blows, she cannot arrive but by steering cross courses, which must necessarily delay her progress.

Suppose now a fleet to leeward, so disposed as that only a part of it can fight with another equally numerous, and ranged to windward in a single line; and let the lee fleet be ranged on the three sides of a lozenge *ab, cd, ef* (fig. 55.). The squadron *ab*, which is most to windward, being drawn up in line of battle, cannot be fought but by an equal number AB of the weather fleet AB, CD, F. All the rest of that fleet therefore must remain inactive, unless the ships which are not engaged should try to pass to leeward of the fleet *ab, cd, ef*. But should the ships of the weather fleet, which are placed between B and F, bear away as they appear in the figure between C*i* and F*i*, it is evident that the ships between A and B, which are fighting to windward, cannot bear away with them. Suppose now that, after the ships between C*i* and F*i* have passed to leeward, the squadrons *cd, ef*, which are ranged according to the new system, and have not yet been engaged, should come to windward and join with their friends *ab* against that squadron of the enemy AB which is still to windward and engaged; it seems almost inevitable but that the squadron AB must be destroyed by so great a superiority, before it could receive any assistance from the ships to leeward between C*i* and F*i*. No doubt those ships would endeavour to succour their friends; but with respect to them, the squadron AB must be considered as placed in that part of the horizon which our author calls *crossed and indirect*, and to which they would not be able to repair but by steering alternately the two close-hauled lines; and assistance brought by so tedious a course would come too late to be of essential service. It is from this apparently well supported conclusion that the viscount de Grenier

deduces the propriety of his proposed orders of sailing and order of battle.

Of orders of sailing, he thinks, there can be no occasion for more than three; one, when a fleet is to pass a strait; another, when it steers in an open sea, either looking for the enemy or trying to avoid him; and the third, when it has an extensive cruise to perform, in which the ships should be so disposed as not to be surprised or cut off by the enemy. His first order of sailing differs not from that in common use. It is and must be observed (says he) in any narrow road, whatever may be the occasion of its narrowness, whether rocks or sands.

In the second order of sailing, when the fleet is looking for the enemy or trying to avoid him, the columns *ab, cd, ef*, are to be formed on three sides of a regular lozenge, and ranged on the two close-hauled lines. The ships of the two divisions *cd, ef*, sometimes to windward (as in fig. 56.), and sometimes to leeward (as in fig. 57.), of the third division *ab*, are to be formed on two parallels or one of the close-hauled lines in the wakes of their respective headmost ships; and the third division *ab* is to be ranged ahead or altern of the two others on the other close-hauled line, and nevertheless to steer chequerwise the same course as the two divisions *cd* and *ef*. When *ab* is to windward of *cd* and *ef* (fig. 57.), the viscount calls that the *primitive* windward order of sailing; and when to leeward (fig. 56.), the fleet is in the *leeward primitive* order of sailing. The position of the three divisions in the windward primitive order of sailing is the same for the order of battle natural; for the order of retreat; and for the order of circumvallation, when the object is to separate from the hostile fleet a part of its ships in order to engage the remainder with more advantage. The position of the three divisions in the leeward primitive order of sailing is also the same for the order of battle inverted; for the order of chasing; and for the order of convoy; so that in no possible case, when looking for the enemy or wishing to avoid him, need the admiral perplex himself with more than these two positions on the one or the other tack, whatever movements he may wish the fleet to make.

In the third order of sailing, the divisions *cd* and *ef*, instead of bearing on the headmost and sternmost ships of the division *ab*, may be very conveniently placed at considerable distances from that division, without the smallest danger of being surprised by the enemy, provided the ships of each of the divisions keep always their respective positions in the two lines of bearing. For if we suppose the three divisions to be in such positions that *ab* and *ef* are at the distance of six leagues from each other (fig. 58), and that the two divisions *cd* and *ef* rest on the extremities of the base of the triangle STV, while the centre ship of the division *ab* rests on its summit T; none of the divisions could be cut off by an enemy, however formidable, seen from its centre ship at the distance of six leagues. For if, upon the proper signal being thrown out, the division *ab* should steer from T towards X, on the course opposite to the close-hauled line it steered before, and the two divisions *cd* and *ef* steer from V and S towards X likewise; it is plain that each of these three divisions would have only three leagues to run in order to join the other two in the windward primitive order of sailing, which is the same with the order of battle natural; whilst the enemy, which was first perceived at the distance of six leagues, must necessarily run nine before he could come up with the nearest of these squadrons. And if frigates were placed ahead, and in the intervals between the divisions, at the points *y, y* to windward and leeward of the fleet, the enemy might be seen at a still greater distance, and the danger of surprise be still so much less.

14
Order of
battle.

We have said, that the position of the three divisions in the primitive orders of sailing is the same with our author's proposed order of battle; but there is this difference between them, that in the order of battle only the ships of one of the three divisions stand in the wakes one of another, and that those of the two other divisions are ranged on two parallel lines, and steer chequerwise. So that if it be wanted to change a fleet from the windward primitive order of sailing to this new order of battle on the other tack, the movement will be infinitely quicker than those which, in former known tactics, are commonly prescribed, to pass from all the orders of sailing either in one line, or on the obtuse angle of chasing or retreating, or in three or six divisions, to the usual order of battle. For it will be sufficient for the ships of the three divisions, ranged in the windward primitive order of sailing, to heave in stays all together, and get on the other tack in the opposite line of bearing, and they will instantly find themselves in this new proposed order of battle (fig. 59.); and should the fleet be in the leeward primitive order of sailing, it would be sufficient for the ships of the three divisions all together to haul their wind on the same tack as they steer, and they would find themselves in order of battle (fig. 60).

145
Natural
and invert-
ed.

When the two columns *cd*, *ef*, are to leeward of the third division *ab*, ranged in order of battle, our author calls that the order of battle *natural*; and when *cd* and *ef* are to windward of *ab*, the fleet is in the order of battle *invert-ed*. The former of these orders is calculated for a fleet combating to leeward, and the latter for a fleet which must combat to windward.

146
Advanta-
ges of these
orders of
sailing and
of battle.

That we may form some notion of the advantages which our author expects from drawing up a fleet for battle in the form of a lozenge, let us suppose the line *AB*, *CD*, *EF* (fig. 61.) to represent the fleet of an enemy to windward in the ordinary order of battle on the close-hauled line of bearing, and on the starboard tack. Then the leeward line *ab* will represent one of the divisions, in order of battle on the starboard tack, of the fleet ranged according to the new natural order, which the enemy wishes to attack, and to which he believes himself superior, because that division offers a front much inferior to his own. The two lines *cd*, *ef*, will represent the two other divisions standing on chequerwise on the same tack as the line of battle, and formed on the opposite close-hauled line. On this supposition, if the divisions *AB*, *EF*, of the hostile fleet, which have it not in their power to attack the ships of the line *ab*, wish to fall on the headmost ship *a* or the sternmost *b* of that line, they will be obliged to bear away in order to attack the two ships *a* and *b*. To prevent this, each of the divisions *cd*, *ef*, of the fleet ranged according to the new order, should make the following evolutions, according to their respective situations and to the manœuvres of the enemy.

147
Evolutions
to be per-
formed
when en-
gaging,
and

1st, The ships of the division *ab* are to slacken as much as possible their headway, and form a very close line, till the enemy makes a movement to attack the headmost or sternmost ship of that division.

2dly, The ships of the division *cd* are to make sail till they come under the second or third ship of the rear of the line of battle *ab*, when they will take the same sail as the

ships of that division, to preserve that position until the hostile ships make their evolution to attack the rear ships of that division. In this situation the ships of the division *cd* will be able to observe the manœuvres of the enemy, in order to change tack and form themselves in order of battle on the opposite board as soon as the hostile ships shall have, after their bearing away, run over a certain space: because the ships of the division *cd*, steering afterwards close-hauled in the wake of the sternmost ship of the division *ab*, will be able to cover the rear ships of that division, and get the weather-gage of the hostile divisions which are bearing away; rake their ships; run alongside of them; double their rear-guard, and put it between two fires, if those hostile ships are following in the wake of each other (*c*); divide it if they bear away chequerwise, or gain to windward, and put between two fires the enemy's division *CD*, while it is engaged with the division *ab*.

3dly, The ships of the division *ef* may abandon their post and run chequerwise under a press of sail, in the same course and in the same order they were formed, as soon as they perceive that the enemy falls ahead of the division *ab*; in order that if the division *AB* of that enemy makes any manœuvre to bear away and fall on the division *ef*, or on the van of the division *ab*, they may, by going about, steer in order of battle close-hauled on the opposite line of bearing, and cover the headmost ship of the division *ab*, double the hostile division *CD* ahead, or divide the other hostile division *AB*, which is running chequerwise on the opposite tack.

The two divisions *cd*, *ef*, might again manœuvre another way, in case the ships of the enemy were ranged in one single line, not well formed, or should be in disorder and laged too great a distance between them while they are engaged very close with the division *ab* (fig. 62).

1st, By putting about the ships of the division *ef*, and likewise the ship *a* headmost of the division *ab*. 2dly, By making at the same time the ships of the division *cd* tack, and likewise the ship *b* of the division *ab*, to keep by the wind on the opposite close-hauled line. 3dly, By making all the ships of the division *ab* (which stood between the headmost *a* and the sternmost *b*) bear away four points at the same time, and making them also take the same tack as the ships of the other two divisions when they are on the beam of the sternmost ships of those two divisions; because, in that position, the ships of the two divisions *cd*, *ef*, getting to windward on two parallels in order of battle, in the wake of the two headmost *a* and *b*, might put between two fires a part of the enemy's ships, which then would be obliged to take the same tack as these two divisions, because the ships of the division *ab* (which are on the same tack as those two divisions) might prevent the ships of the enemy steering the course opposite to that tack.

From this succinct exposition it may be observed, that, in the first supposition, the way of thus disposing the forces of a fleet is so much the more suitable to the defence of the headmost and sternmost ships of a line of battle, as the ships of the division *cd*, being covered by that line of battle, are able to manœuvre without any one ship of that division being exposed to the fire of the enemy; that the division *ef*, the headmost ship of which is *e*, always presents the side to the

(c) If the hostile ships which are not engaged with any of those of the division *ab* bear away in succession in the wake of their headmost, in order to pass to leeward of the division *ab*, and to put it between two fires; then the ships of the division *ef* must necessarily take the weather-gage of them, since the headmost of that division *ef* is by her very situation already to windward of the headmost of the adverse ships which are bearing away, and she has the opportunity to come as close as possible to the sternmost ship *b* of the line of battle *ab*.

the enemy, without any one ship of that division being exposed to receive the fire of the enemy either ahead or astern, because they are not to range in a line of battle unless the enemy runs large or before the wind; and that, in the second supposition, the only ships which are liable to be raked astern, while they change tack, are the headmost and sternmost of the division in line of battle which cover the ships of the other two divisions.

As it is of the utmost advantage to know, at first sight of the enemy, whether it be to windward or leeward of the fleet ranged lozenge-like, on what tack, and on what side the fleet must be formed, in order to defend itself or attack the enemy with advantage, it is to be observed, that in both the windward and leeward primitive orders of sailing the direction of the wind always traverses both the weathermost and leewardmost ships of the fleet (figs. 57. and 56.); that this leewardmost ship is always placed in the centre of an horizon, which is to be considered as the horizon of the whole fleet; and that it is from that ship you are to judge, by means of the rules which are known and practised in such cases, whether the lozenge-like fleet be to windward or to leeward of that of the enemy.

If you want to know, at sight of the enemy, seen either to windward or to leeward, on what side the line of battle is to be formed in order to be able to send one of the divisions on that side of the lozenge where there is none, it is the position of the enemy, with respect to the direction of the wind, which is to determine it; because, if the enemy is to windward of the fleet ranged in the windward primitive order of sailing, and if it bears down on that fleet, with the wind large or right aft, it belongs to its weathermost ship to observe what follows. If that ship, by setting the enemy, finds him to starboard of the direction of the wind, the division which is starboard of that direction of the wind is to take the starboard tack, and range in order of battle before the enemy is arrived within gunshot: if, on the contrary, the above-mentioned ship finds the enemy to larboard, it belongs to the larboard division to assume the order of battle, and to take that tack, before the enemy can come to action. The old rule for choosing the proper tack is to be observed by a fleet in the leeward primitive order of sailing; observing, that it is the business of that fleet's leewardmost ship to determine it; and the point of the horizon which is opposite to that whence the wind blows, is the point towards which the observer is to be turned to judge on what side, whether starboard or larboard, the line of battle is to be formed; because, in that position, the starboard side must always be on his right hand and the larboard on his left.

By following this general rule, the line of battle will never be exposed to be too much lengthened either to windward or to leeward, in order to oppose all the ships of the adverse fleet formed in one single line, nor even to be surprised in disorder by that fleet while you are forming in orders of battle natural or inverted.

Our author's orders of CHASING, of RETREAT, and of CONVOY, are very easily formed. We have already said what they are; and the seaman, or even the landsman, who has any tolerable conception of his orders of SAILING and of BATTLE, will not stand in need of any farther description of them. It must, however, be observed, that in the order of chasing, the fleet in the lozenge-like position presents the obtuse angle of chasing, as when ranged according to the ordinary tactics; with this difference, that, in order to form themselves in order of battle, it is enough that, in this lozenge-like position, the ships of the second division should all keep the wind on the same board they were standing on, because they would afterwards find themselves in a line in

the wake one of another; but, according to the usual tactics, the ships have a long space to run before they can execute the same evolution.

We shall conclude this short view of the Viscount de Grenier's tactics, with his directions for the most advantageous placing of the admiral's ship, the frigates and transports, belonging to a lozenge-like fleet, whether it be ranged in the order of sailing or of battle, &c.

In the order of sailing, the admiral A is to be placed ahead of the fleet, at a short distance from the headmost of the second division, and in the direction of the wind with the headmost of the first division (fig. 53.). Two of the frigates ff are to observe the same rule and the same position, with respect to the van ship of the third division and the sternmost of the first. In the order of battle, on the contrary, the admiral is to be in the centre of the lozenge, and two of the frigates on the fourth side of the lozenge, (fig. 64). As for the transports and store-ships, when there are any, their station is to be in one line on the side opposite to that of the enemy, when ranged in order of battle; and, if in order of sailing or convoy, they may occupy the space circumscribed by the lozenge. In any other circumstances these ships are to occupy the different stations appointed for them, that they may distinguish the signals and execute the commands of the admiral. Lastly, when the fleet shall pass from the order of battle to any other order whatever, or from any order to the order of battle, the admiral's ship is to bring to, and not to take any of the positions above mentioned till after the complete execution of the movement.

CHAP. II. View of Mr Clerk's Tactics.

WHETHER the Viscount de Grenier's order of battle and of sailing would be attended with all the advantages which he hopes from them, experienced seamen alone can judge; but we are now to introduce to our readers part of a system which has met with very great approbation from some of the ablest officers in the British navy, and which to us appears to be founded on principles self-evident. Mr Clerk, in the introduction to his Essay, informs us, that upon considering the great superiority displayed in the three last wars by the British seamen over their enemies, when engaged in single ships, and comparing it with the very little that, previous to Lord Rodney's glorious action, they had achieved when engaged in fleets drawn up in line of battle, he was led to conclude, that there must be something wrong in our mode of making the attack. He turned his thoughts to the subject, and in 1790 published part of a large work, comprehending, 1. *A Theory of Attack from Windward*; 2. *A Theory of Attack from Leeward*; and, 3. *An Historical Sketch of Naval Tactics*. We think it not much to the honour of our countrymen, that he has not yet had encouragement to publish more than the first part; but in hopes of exciting their curiosity, we shall lay before them a distinct view of that part, beginning, as he begins, with

OBSERVATIONS ON THE PRESENT METHOD OF BRINGING SHIPS TO ACTION.

It has often, if not generally, been the practice, in the case of single ships, as well as in that of fleets, for the weather ship or fleet, when it is wished to bring the other to action, to steer directly down upon that ship or fleet, without reflecting that, by doing so, it gives the enemy an opportunity of completely disabling it, before it can attain its wished for station. For each ship in the lee line can use all the guns upon one side; whereas the ships in the weather-line,

Tactics.

ther-line, bearing directly down, have it only in their power to use their bow-chafes. This method of attack appears, therefore, to be the worst possible for the weather-fleet, and the most advantageous for the lee fleet. For suppose a single ship of 80 guns to windward at B (fig. 65.), discovering an enemy's ship of equal force to leeward at F, to bear directly down upon her endwise, the receiving ship F, by lying to as in fig. 66. would present a broadside of 40 heavy guns bearing upon B during a course of two miles, in which every shot might take effect; while B, in this position, would have it in her power to bring only the two light guns of her fore-castle or bow-chafe to bear on F; a disadvantage greatly exceeding twenty to one. Besides, the receiving ship F, by lying broadside to, will have all her masts and rigging more open, and consequently will allow shot to pass with less effect than the ship B, which, coming endwise, is liable to be raked by every shot from stem to stern. The consequence of which must be, that B would be disabled in her rigging, &c. long before she could arrive at a proper position for annoying F; and when she had attained that position, F, by being entire in her rigging, would have it in her power to fight in any position, or to make off at pleasure.

yards; and let the perpendicular line FK, proceeding right out from the beam of the middle ship F, to the distance of six cable's length or 1440 yards, be divided into six equal parts: It is evident, from inspection, that a ship stationed at the point E of the line FK, 720 yards distant, cannot for any length of time be exposed to the fire of more than the centre ship F of the fleet I, H, F, H, I. For supposing the ships H, K, ahead and astern of F, to be able to bring their broadsides to bear on E (a supposition which, if the line be close-hauled, cannot be made of the headmost of those ships), it is evident, that by putting themselves in positions proper for that purpose, the ships H, H, will not only disorder their own line, but also leave, the one her head, and the other her stern, exposed to a raking fire from their opposites B, B, in the enemy's line.

153
Proper method of attack.

The method, then is, B having the wind, should run down astern, as *per* dotted line, and getting into the course, or near the wake of F, or a position that will bring her parallel to the course of F, at a proper distance, she should then run up close alongside of F, upon equal terms, as in fig. 67; or otherwise, on shooting ahead, she may veer, and run down on the weather-bow of F, as in fig. 68. till she shall force F to bear away to leeward, keeping close by F on equal terms; but during the course, in both cases, carefully watching that F may not have it in her power to bring her broadside to bear upon B without retaliation.

But if the opponent ship cannot well be exposed to the fire of the two ships H, H, at the point E, she must be still less exposed at the point C, 480 yards distant; and it will be almost impossible for the ships H, H, to touch her at the point G, 240 yards, or one cable's length, distant.

But one cable's length astunder is too small an allowance for accidents that may happen by the ships I, H, F, H, I, extended in line of battle ahead. Therefore let us suppose the three ships, which are said to be at once upon a single opponent, to be stationed at I, F, I, at the distance of two cable's length or 480 yards from each other. Then it is evident that the opponent ship cannot now be more exposed at the point K, at the distance of 1440 yards, than she was, on the former supposition, at the point E, 720 yards distant; and if we suppose the line of battle to be formed at one and an half cable's length astunder, she must be at L, distant 1080 yards, before she can be annoyed even to this degree by the three hostile ships at once. Hence we may fairly conclude, that if one ship has any time been exposed at once to the fire of five, four, or even three ships of the enemy's line, such ship must have been at a very great distance, and in no great danger.

154
Modes of attack by the British and French.

It having been often said that the French have made it a rule to throw the whole effect of their shot more particularly into the rigging of their enemy, and that the British, on the other hand, have been as attentive to point the force of their fire against the hull of the ship; it may be proper here to state the two cases, and compare the effect.

Having finished the above observations, our author proceeds to the principles necessary to be known for enabling us to judge of the different modes of bringing great fleets to action. For this purpose he supposes a fleet of 10, 20, or more ships, of 80 guns each, extended in line of battle to leeward, and lying to at F (fig. 71.), with the intention of avoiding an attack; whilst another fleet at B, of equal number and force of ships, also extended in line of battle, three or four miles to windward, is desirous of making an attack, and coming to close action on equal terms with the fleet F. In this disposition of the two fleets, should that to windward run down headlong ship for ship on its opponent, as in figs. 66. and 69. it is evident, from what has been said in the beginning of this chapter, that each individual ship of the weather-fleet might be completely disabled, before it could possibly come to close action with the fleet to leeward. But let it be supposed that the commander of the weather fleet B, though his ships have been much disabled in their rigging during their course *abaft* from windward (fig. 72.), has made them bring to at a great distance, from whence he can hurt F; is it to be expected that F, whose desire has always been to avoid a close engagement, and who has already disabled the ships of B, will patiently lie still, or wait until B shall have time to disable him in his turn? No surely. While enveloped in his own smoke, as well as that of his enemy, he will bear away unhurt to a new station G, and there remain out of the reach of B's cannon-shot, who must repair his rigging before he can attempt a second attack.

156
Principles necessary for bringing fleets to action.

155
A ship in the line of battle can be exposed to the fire of many at once.

Let us suppose a ship of 80 guns wishing to avoid the effects of a close engagement, but at the same time lying to as at F (fig. 63.), intending to receive, with every advantage, an enemy B of equal force, coming down with an intention to fight her; and let us suppose that F, by aiming her fire at the rigging of B, shall have carried away any of the principal stays, eight or ten windward shrouds, or a fore-topmast, or any other rigging, though of much less consequence, but, at the same time, without having wounded a single man of the ship B; and suppose a second ship, consort to F, receiving such another ship as B, and by firing at her hull only, shall, without other damage, have killed 30 or 40 of her men: In this critical juncture, when F and her consort are desirous of avoiding a close engagement, it is evident that the ship at B, which has lost part of her rigging, is more completely disabled from closing with them than the other ship, whose rigging is entire, though she may have lost 100 of her men.

It has been often said, that some particular ship has been exposed in battle to the cannonade of three, four, or even five ships, all extended in the enemy's line, and all bearing upon her at one and the same time; but this can never have been the case, but when the ship so exposed was at a very great distance. Let I, H, F, H, I, (fig. 70.) represent five ships extended in line of battle ahead at the distance of one cable's length, or 240 yards, from each other; let the length of each ship be 40 yards, so that the whole space between head and head of any two adjacent ships is 280

Again, suppose that B, in place of going headlong and endwise down, were to run down in an angular course, or *lyking*

View of
Mr Clerk's
Tactics.

of *lasking* as it has been called; it is evident from fig. 72. that should any ship in this angular line come to be crippled, her way being stopped, might of consequence occasion a confusion amongst the ships next astern to her, some running to leeward and others to windward of the disabled ship: and thus the time be lost for affording the necessary support to the ships ahead, and now so far separated from their companions. Should it be said, that a stoppage of one ship ahead will not necessarily produce a stoppage of every ship astern, because they may go to leeward of the disabled ship; we answer, that the ships ahead in the van A (fig. 74. n^o 1.) may be now engaged, and of consequence not having much headway, may be said to be stationary; therefore every ship astern, if she shall attempt to bear down, as at D, D. from being confined to a determined course, must be brought into the position of being raked when coming down before the wind, as in figs 76. and 69. and consequently of being completely disabled long before she can get close enough alongside of the enemy

Again, the headmost ships, or van of B, having attained their station at A, that is, abreast of the van of F (fig. 74. n^o 1.), and having begun the cannonade, may we not suppose that F, whose conduct or desire has always been to save his ships, has instructed the commanders of those in the van of his fleet to withdraw from danger as soon as they begin to feel the effects of a cannonade? and if so, may not those ships, as soon as they have thrown in their fire upon the van of B, bear away in succession as at H, followed indeed by the whole ships of F's fleet, which, having poured in their fire upon the van of B, may form a new line of battle two or three miles to leeward at II (fig. 74. n^o 2.), and there be in readiness to receive a second attack, if B shall be so imprudent as to attempt it? And is it not farther evident, that if any one or more ships of the Squadron of F shall be crippled, they will have it in their power to quit their station, being covered with smoke, at any time, and to fall to leeward as at G. where they will be in safety?

In order to illustrate this still farther, let B (fig. 75.) represent a fleet putting before the wind, each ship with an intent, when brought to a determined distance at A, to take up her particular antagonist in the line of the enemy F to leeward; and, for argument's sake, let F be supposed at rest, without any motion ahead. There seems to be no difficulty in conceiving, that while the alternate ships of F's line, under cover of the smoke, withdraw from battle to GGG, the intermediate ships left behind them in the line will be sufficient to amuse even the whole of B's fleet, till the ships G shall form a new line H-H as a support from the leeward. In such case B, after being disabled, as he must be, and not having foreseen the manœuvre, will neither be able to prevent the intermediate ships with which he is engaged from bearing away to join their friends, nor, were he able, would it be advisable to follow them; for the same manœuvre with equal success can again and again be repeated.

In order to show the relative motion of both fleets, let F (fig. 76.) be a fleet consisting of twelve ships, drawn up in line of battle, at one cable's length or 120 fathoms asunder; and let the length of each ship from the end of the jib-boom to the stern be 363 d fathoms; the whole fleet will then occupy a space of two English miles; also, let its rate of sailing be four knots an hour in the direction FG. so that in the space of an hour it may have moved from F to G four miles distant from its former position.

Let B be the opponent fleet, consisting also of twelve ships, and four miles to windward; and let the point A be 440 yards, or one quarter of a mile, right to windward of

the point G. Then if B, by bearing away in the direction BA, shall arrive at the point A at the same instant that F, the fleet to leeward, has arrived at the point G, the motion of the fleet B will have been at the rate of 5 1/2 miles nearly per hour; and the angle contained between the direction of its line of bearing and present course 42° 9', or nearly 4 points. For in the right-angled triangle ABM are given BM = 4 miles, and AM = 3 1/2 miles. Now BM = 4 m. : AM = 3 1/2 m. : R : tan. ABM = 43° 9, and R : sec. ABM. 42° 9' : BM = 4 m. : B = 5.83 m.

Again, if F, as in fig. 77. by carrying more tail, shall move at the rate of six miles an hour, that is, from F to G; then B, having his course made thereby the more slanting, will have just so much the greater difficulty of keeping his ships in line abreast while coming down to the attack: For the leading ship meeting with no obstruction in her course, will push on; whereas every accident of obstruction accumulating, as it happens to each ship progressively, the rear, being affected in the greatest degree, will for that reason be left the farther astern. But, from the very form of this slanting course, every ship astern will be apt to get into the wake of the ship ahead. Therefore the whole fleet of B, van and rear, will not arrive in the same time at the line AD, so as to be in a perfect line abreast, and parallel with the fleet to leeward; but will have assumed the lasking form, as represented at the points M, N, and O. in the different parts of the course. In this case, the distance run by the van of B, from B to A, is 7.075 miles, or 7 miles and 132 yards, and the angle contained between the line of bearing and the distance BA is 22° 0'.

And again, as in fig. 78. if the fleet to leeward shall lie up one point higher, as FG, then the rears of the two fleets will thereby be removed at a much greater distance, and the van A of consequence must be sooner up with the enemy's van, and evidently so much the farther from support; while F, by bringing up his ships in succession, will have it in his power to disable the van of A, and will afterwards bear away, as at H, unhurt and at pleasure; while B, at this time, by the supposition, being crippled, or having his rear D obstructed, and at a distance, will be unable to prevent him. And in all the three cases, it is evident that the fleet B, so soon as he shall approach within reach of gun-shot, must be exposed to the fire of F's whole line; for he will be abreast of B continually in every part of his course. But the difficulty of bringing the rear of the windward fleet to action will still be more increased, if the sternmost ships of the fleet to leeward, in place of keeping their wind, shall bear away occasionally as at ML. All which being admitted, the difficulty of bringing adverse fleets to close engagement may be accounted for, without being obliged to have recourse to that supposed inferiority in point of sailing, imputed to our ships, compared to those of the French or enemy.

Hence it appears, that a fleet B to windward, by extending his line of battle, with a design to stop and attack a whole line of enemy's ships to leeward, must do it at a great disadvantage, and without hope of success; for the receiving fleet F to leeward unquestionably will have the four following advantages over him: 1. The superiority of a fire above 20 to 1 over the fleet B, while coming down to attack. 2. That when the ships of B are brought to at their respective station, if it blow hard, the shot from F, by the lying along of the ships, will be thrown up into the air, and will have an effect at a much greater distance; whereas, on the other hand, the shot from B, from the same cause, will be thrown into the water, and the effect lost. 3. That F will have the power of directing and applying at pleasure the fire of his whole line against the van of B, who is now

View of
Mr Clerk's
Tactics.

unable to prevent it, his ships being disabled, separated, and therefore unsupported. 4. That F will also have a greater facility of withdrawing from battle the whole or any one of the disabled ships of his line.

If then, after a proper examination of the late (n) sea-engagements or rencounters, it shall be found that the French admirals have never once shown a willingness to risk the making of the attack, but invariably have made choice of, and earnestly courted, a leeward position; if invariably, upon seeing the British fleet disabled, they have made sail, and demolished the van in passing; if invariably, upon feeling the effect of the British fire, they have withdrawn at pleasure either a part or the whole of their fleet, and have formed a new line of battle to leeward; if the French repeatedly have done this upon every occasion:—and, on the other hand, if it shall be found that the British, from an irresistible desire of making the attack, as constantly and uniformly have courted the windward position; if, uniformly and repeatedly, they have had their ships so disabled and separated, by making the attack, that they have not once been able to bring them to close with, to follow up, or even to detain one ship of the enemy for a moment—shall we not have reason to believe, that the French have adopted and put in execution some system which, if the British have discovered, they have not yet profited by the discovery?

Our author therefore, instead of the usual mode of attack, which, by being made principally on the van, seems to be the result of a groundless expectation of being able to *take, destroy, or disable* the whole of the enemy's line, proposes

A NEW MODE OF ATTACK FROM THE WINDWARD UPON THE REAR OF THE ENEMY.

157
Mr Clerk's
mode of at-
tack upon
the rear of
the enemy.

Suppose, says he, a fleet of ten, twenty, or more ships, extended in line of battle at F (fig. 79.), endeavouring to avoid a close engagement, but at the same time keeping under an easy sail, with the intention of receiving the usual attack from another fleet of equal number, three or four miles to windward at B, sailing in any form, but let it be in three lines or divisions; it is required by what method shall B make the attack on F with advantage?

The improbability, or rather impossibility, of attacking and carrying the enemy's whole line of ships, having been demonstrated by every action which has been fought at sea, the next consideration will be, how many ships may be attacked and carried with advantage? Let it be supposed that the three sternmost ships only, and not exceeding the fourth, are possible to be *carried*; let a sufficient strength A be sent down to force an attack upon these three ships, disposed and supported according to the judgment of the admiral, while in the mean time he keeps to windward with the rest of his fleet, formed into such divisions as may best enable him to attend to the motions of the enemy and the effect of his attack; being himself so far disengaged from action, as to be able to make his observations, and give his orders, with some degree of tranquillity.

By placing the fleet B in such divisions as represented in the figure, when the attacking squadron comes up with the rear of the enemy, the whole will be so disposed, and so connected together, as to be able to give the support and attention that may be required to any ship, or any part of the fleet, and in preference to a long extended line of six or

seven miles in length, where it must be impracticable to give the necessary support to such ships as may be disabled. The ships of the fleet F may, in general, be better sailers than the ships of the fleet B; but it is not conceivable but that the swiftest ships of B must come up alongside of the sternmost and dullest sailing ships of the enemy F; while, at the same time, F, by attempting to out-sail B, must be thrown into the disorder of a down-right flight: Therefore, of course, it must be admitted, that if the enemy F continues going off in line of battle, and endeavouring to avoid a close engagement, it will be impossible to prevent the fleet making the attack from getting into the position B A. But by this position, it is evident that the three ships at I of the fleet F will be in the power of the admiral of B; for, by keeping so many ships to windward, he will be enabled to send down fresh ships from time to time, either for the support, or to supply the station, of any of those that may be disabled in making the attack, while it may be imagined that the three ships in question, by being disabled, or being deprived of the wind now taken out of their sails by the ships to windward, will be prevented from following their friends. Hence the enemy ahead must either abandon his three sternmost ships, or he must double back to support them; which must be done either by tacking or veering. But let it be first examined what is naturally to be done by tacking; and for the greater satisfaction, let every possible case that can happen be examined separately.

First, let us suppose that the enemy at F, fig. 80. has continued to protract his course in line of battle upon the same tack, and that the headmost ship H, with the three next astern of her, have tacked to windward, and that the whole remaining ships intend to tack the same way, but in succession; is it not evident that F has then left his three sternmost ships at I in the power of the ships at A; that he must also leave exposed his fourth and fifth ship G to another attack from another division of B at C, which will also be on equal terms as with his three sternmost at I; and lastly, if he prosecutes his intention of supporting his three ships, he will be obliged to begin a disadvantageous attack upon the admiral, with the main body of the fleet lying ready to receive him? The consequence of all which must be, that he will not only lose his three sternmost ships, but in all probability the fourth and fifth also, as at G; and will be forced to begin an attack, and close and mix ship with ship on equal terms; a situation which he at all times, with the greatest anxiety, hath avoided, and which B with equal anxiety has always courted.

Again, suppose that his three sternmost ships have been attacked, and that he has ordered his fleet to tack all at one time, as in fig. 81. The consequences will then be, that this movement, having required some time and some length of course, will have produced a considerable distance between his main body and his three ships; or, in other words, that these three ships have been deserted; for it will not be in their power to tack with the rest of their friends. He must also, in bringing his ships heads round, expose the ships nearest his enemy to be raked by a dreadful cannonade; besides running the risk of having his fleet thrown into a general disorder, by many of his ships missing stays, veering, and running to leeward. Lastly, upon a supposition that his ships have all tacked, and none of them missed stays, still he

(n) This was written during the American war, and before Lord Rodney's decisive victory on the 12th of April 1782. That action, as well as the still more brilliant one of Lord Howe on the 1st of June 1794, we have heard the author distinguish from those battles which, with great propriety, he calls *sea-rencounters*, and do ample justice to the scientific manœuvres of both the noble admirals.

View of Mr. Clerk's Tactics.

of he must of necessity begin the attack, mix his ships, and come to a close engagement, as in the former case.

Having shown the consequences of an attempt to succeed the three sternmost ships by tacking, let us also examine what may be expected from an attempt to do it by veering the fleet. Suppose the two fleets in the same position as in fig. 79. that is, the main body of the enemy extended in line of battle to leeward, his three sternmost ships entangled with the fleet B, whose admiral, with the main body, keeps to windward to observe, with a rigid attention, the motions of the enemy. At the same time suppose that the admiral F has ordered his sternmost ship G to veer (fig. 82.), and afterwards the whole line; and that he is now running upon a contrary tack to leeward, as at H, wishing to support or bring off his three ships. From inspection, it will be evident that this attempt may be more dangerous than the attempt to windward; for it will expose a number of his ships to a raking fire while in the act of veering; and the squadron, by getting so far to leeward, will be unable to give the proper support to the three ships. It will open a gap for the fleet of B (who will immediately veer also and follow him) to break in, as at A, and cut off the three ships without hope of recovery. And if F still persist in the endeavour to recover his three ships, he will be obliged to begin the attack under all the usual disadvantages.

Again, upon another supposition, that the headmost ship of the enemy H (fig. 83.), with the four or five next astern, have wore, and are running upon a contrary tack, wishing, as before, to support or bring off the three ships, the rest of the fleet intending to veer also, and follow in succession; it is evident that this movement, being more unseaman-like, will be worse than the last: It will expose an additional number of ships, particularly the last two, as at G; and will at the same time make an opening for the main body of B's fleet to fall in and cut off the three ships, as in the former case.

Again, should the enemy F veer and bear away with his whole ships at one and the same time, it is evident that this movement must have the consequence of a downright flight, with the certainty of losing the three ships.

From what has been said, it will appear, that a fleet B, keeping connected in a body to windward, may come up with and entangle the three sternmost ships of an enemy F, extended in line of battle and going off to leeward, and at the same time be able to overawe the remaining main body of their fleet; and that, having forced the position, the whole consequences, as already described, must follow; that is, F must submit to the loss of three ships.

What has been hitherto said proceeds upon a supposition that the fleet F has kept on his course till the fleet B has come up with his rear. Let it then be examined what other attempts the enemy F can make to avoid coming to close engagement upon equal terms.

Suppose a fleet of ships of the enemy standing on the larboard tack to leeward, and going off as before at F, and a fleet of ships in a collected state or position to windward, as at B (fig. 79.); and suppose that the enemy F, perceiving the fleet B pointing an attack against his rear, in place of keeping on his course upon the same tack, should veer, and endeavour to pass on contrary tacks to leeward (for it will not be admitted that he can get to windward); what will then be the effect?

Is it not evident, that the headmost ships of F must be forced to leeward by the fleet B obstructing his line of direction, or the line of his course? that they must be forced to begin an attack at any distance B may choose? that they may receive such damage as will stop their way? that their way being stopped, will of course be an obstruction to

the next astern; or that these subsequent ships, to prevent this stop, must bear away to leeward of their crippled ships, as at G (fig. 84.), which will not only prevent these ships from damaging the headmost ships of B, but will give time and opportunity to B to bring down his windward ships to fall in either ahead or astern, that is, to the right or left of his headmost ships A, and oppose ship for ship of the enemy upon equal terms? But should none of the headmost ships of the squadron F be crippled, that is, should F pass B without reach of cannon-shot, which undoubtedly he will do if he can; still, while bearing away, he may be forced to suffer a distant cannonade, ship with ship on equal terms, whether he veers and gets back upon his former tack, as at G in fig. 85. or continues to run before the wind, as at P in fig. 86. But if F persists to pass on a contrary tack to leeward, and without reach of cannon-shot, it is evident, whether he put right before the wind, or run off ship by ship as he best can, that B must at some time or other come up with his rear.

So far the attack has proceeded with the wind fixed in one and the same quarter. To make the propriety of it the more apparent, it will be necessary to inquire, What might be the effect produced by a change of wind, should that take place during the action? For this purpose, let the opponent fleets be placed in some one of the preceding positions, representing the attack upon the three sternmost ships of the enemy, as in fig. 87.; in which the fleet desirous of making the attack is represented in four divisions, as at B, B, B, A, and F the fleet desirous of avoiding the attack, at the hazard of abandoning his three sternmost ships at G.

In the commencement of the attack, let us suppose the wind to be N. and the ships going two points free on the larboard tack, or standing E.; and soon after the commencement let the wind be supposed to veer round to the W.; then it is evident, by the disposition of the two fleets, that the fleet F, by such a change, will have acquired no advantage whatever; on the contrary, it will thereby be thrown just so much the farther to leeward.

Again, if the wind, by taking an opposite course, shall shift ahead and come round by the eastern quarter to L, the admiral of the fleet F will not have it in his power to avail himself of this circumstance, provided the commander of B, continuing carefully to watch his motions, and feeling the impulse of the veering wind, shall stretch his ships, as at OO, to the windward of the three ships at G, separated from F's fleet, and at the same time to the leeward of the main body of that fleet. This will be apparent from figures 83. and 87. which exhibit the two fleets, after this manœuvre, both on the larboard and starboard tack.

Let the wind be supposed to wear round gradually from the E. towards the S. and from thence to the W. and then quite round the compass. Then F being supposed to have gained the wind, it will be in his power to maintain it, and make a circular course to windward of B; but as he can be attended all the while by the fleet B, who will cut him off to leeward, he never will be able to recover his three ships, supposed to be cut off. This is evident without the illustration of a figure.

Lastly, if the wind in changing shall in one instant shift in direct opposition where it was when the attack began, that is, from north to south; then and in that case, before it can be judged whether such change shall be favourable for F or not, it will be necessary that the relative situation of the two fleets should be determined, such as it was when the change took place. For example, if the headmost ships of the fleet F, that is, if his van and centre shall have separated at any considerable distance from his rear, and shall, in

can be got abreast of, at a proper distance, *may be disabled, and therefore commanded*, by the numerous fresh ships kept to windward for this purpose.

when the wind is brisk, and that a calm, in consequence of a vigorous cannonade, may render the attack upon more than three or four of the enemy's ships impossible.

Partial
Breezes of
Wind.

In all these various methods of attack, the fleet making the attack is supposed to sail faster than the other, or at least to come up with it; and that so soon as the ships are engaged, their velocity will consequently be diminished. That being premised, a more proper mode of attack than any of the preceding will perhaps be as follows:

In all the different attacks upon the rear, it has by some been thought a great object, if practicable, to throw a raking fire into the rear of an enemy's line of battle, by ships detached for that purpose. For if shot, as has been said, can take effect at a distance of two miles, from this position it will surely reach the sixth ship, if the enemy's line shall be formed at two cable's length asunder; and if formed at one cable's length asunder, it may reach and may cripple the twelfth ship.

5th, The first or headmost of the ships intended to make the attack is to range alongside of the enemy, and preserve that station. The second ship is to make all possible sail to luff up and pass the first ship, which is now supposed to be engaged, and get alongside of the last but one of the enemy, which she is to engage. In like manner, the third of the attacking ships is to get alongside of the last but two of the enemy, whom she is to engage; and if it be deemed expedient, the fourth, &c. ship may be engaged. It is, however, evident that this method can only be practised

We have now given a cursory view of Naval Tactics in its present improved state; and shall take leave of the subject, with earnestly recommending to our nautical readers Mr Clerk's Essay, which, if allowance be made for the author's peculiarity of style, will surely meet the approbation of every officer who wishes to see the practice of naval war founded on principles of science.

TADCASTER, a town in the West Riding of Yorkshire, noted for the great plenty of limestone dug up near it; and for being one of the first places in which a building was erected for Sunday schools. It is nine miles from York, and 188 from London.

TADMOR. See PALMYRA.

TADPOLE, a young frog before it has disengaged itself from the membranes that envelope it in its first stage of life.

TÆNIA, in zoology; a genus of animals belonging to the class of *vermes*, and order of *intestina*. The body is long, depressed, and jointed like a chain, and contains a mouth and viscera in each joint. According to Gmelin, there are 92 species; all which inhabit the intestines of various animals, particularly of quadrupeds.

Seven species of tænia are peculiar to man. 1. The *visceralis*, which is inclosed in a vesicle, broad in the fore-part, and pointed in the hinder part, inhabits the liver, the placenta uterina, and the sack which contains the superfluous fluid of dropical persons. 2. The *cellulose*, which is inclosed in a cartilaginous vesicle, inhabits the cellular substance of the muscles; is about an inch long, half an inch broad, and one-fourth of an inch thick, and is very tenacious of life. 3. The *dentata*, has a pointed head; the large joints are streaked transversely, and the small joints are all dilated; the osculum or opening in the middle of both margins is somewhat raised. It is narrow, 10 or 12 feet long, and broad in the fore-parts; its ovaria are not visible to the naked eye; and the head underneath resembles a heart in shape. It inhabits the intestines. 4. The *lata*, is white, with joints very short and knotty in the middle; the osculum is solitary. It is from 18 to 120 feet long; its joints are streaked transversely; its ovaria are disposed like the petals of a rose. 5. The *vulgaris*, or common tape-worm, has two lateral mouths in each joint; it attaches itself so firmly to the intestines, that it can scarcely be removed by the most violent medicines; it is slender, and has the appearance of being membranaceous; it is somewhat pellucid, from 10 to 16 feet long, and about four and an half lines broad at one end. 6. The *trutta*, which chiefly inhabits the liver of the trout, but is also to be found in the intestines of the human species. 7. The *folium*, has a marginal mouth, one on each joint.

The structure and physiology of the tænia is curious, and it may be amusing as well as instructive to consider it with more attention. As the tænia is often the occasion of dif-

ease, we may be apt to consider it not only as useless, but even as naturally hurtful; but it is impossible to suppose that the Benevolent Father of mankind created a species of animals solely for the purpose of producing disease. The creation of the tænia is rather a striking instance of that rule which the Deity seems to have laid down to himself, to leave no place destitute of living creatures where they could multiply their species. He has therefore not only covered the earth with animals, but the surface of animals with other animals; and has even peopled such of their internal parts as could supply nourishment without disadvantage. Perhaps therefore a certain proportion of these animals is conducive to health, just as a certain proportion of different fluids is so, tho' an excessive increase always produces disease. For there is almost every different species of quadrupeds in a different species of tænia, which is a full proof that these worms have their structure and situation determined with as much attention and skill as any species of animals whatever. It is also a very curious fact, that those species of tænia which are peculiar to the human race are also peculiar to particular countries. Thus the *vulgaris* is most common in Sweden, the *lata* in Switzerland and Russia, and the *folium* in Great Britain, Saxony, and Holland.

The tænia appears destined to feed upon such juices of animals as are already animalized, and is therefore most commonly found in the alimentary canal, and in the upper part, where there is the greatest abundance of chyle; for chyle seems to be the natural food of the tænia. As it is thus supported by food which is already digested, it is destitute of the complicated organs of digestion. As the tænia *folium* is most frequent in this country, it may be proper to describe it more particularly,

It is from 3 to 30 feet long, some say 60 feet. It is composed of a head, in which is a mouth adapted to drink up fluids, and an apparatus for giving the head a fixed situation. The body is composed of a great number of distinct pieces articulated together, each joint having an organ whereby it attaches itself to the neighbouring part of the inner coat of the intestine. The joints nearest the head are always small, and they become gradually enlarged as they are farther removed from it; but towards the tail a few of the last joints again become diminished in size. The extremity of the body is terminated by a small semicircular joint, which has no opening in it.

The head of this animal is composed of the same kind of materials as the other parts of its body; it has a rounded

Tænia.

opening at its extremity, which is considered to be its mouth. See Plate DI. fig. 1, 2. This opening is continued by a short duct into two canals; these canals pass round every joint of the animal's body, and convey the aliment (fig. 3.). Surrounding the opening of the mouth are placed a number of projecting radii, which are of a fibrous texture, whose direction is longitudinal. These radii appear to serve the purpose of tentacula for fixing the orifice of the mouth, as well as that of muscles to expand the cavity of the mouth, from their being inserted along the brim of that opening: (See fig. 1.) After the rounded extremity or head has been narrowed into the neck, as is represented in fig. 2. the lower part becomes flattened, and has two small tubercles placed upon each flattened side; the tubercles are concave in the middle, and appear destined to serve the purpose of suckers for attaching the head more effectually. The internal structure of the joints composing the body of this animal is partly vascular and partly cellular; the substance itself is white, and somewhat resembles in its texture the coagulated lymph of the human blood. The alimentary canal passes along each side of the animal, sending a cross canal over the bottom of each joint, which connects the two lateral canals together. See fig. 2.

Mr Carlisle, who gives the best account of the structure and economy of the tænia which we have seen, injected with a coloured size by a single push with a small syringe three feet in length of these canals, in the direction from the mouth downwards. He tried the injection the contrary way, but it seemed to be stopped by valves. The alimentary canal is impervious at the extreme joint, where it terminates without any opening analogous to an anus. Each joint has a vascular joint occupying the middle part, which is composed of a longitudinal canal, from which a great number of lateral canals branch off at right angles. These canals contain a fluid like milk.

The tænia seems to be one of the simplest vascular animals in nature. The way in which it is nourished is singular; the food being taken in by the mouth, passes into the alimentary canal, and is thus made to visit in a general way the different parts of the animal. As it has no excretory ducts, it would appear that the whole of its alimentary fluid is fit for nourishment; the decayed parts probably dissolve into a fluid which transudes through the skin, which is extremely porous.

This animal has nothing resembling a brain or nerves, and seems to have no organs of sense but that of touch. It is most probably propagated by ova, which may easily pass along the circulating vessels of other animals. We cannot otherwise explain the phenomena of worms being found in the eggs of fowls, and in the intestines of a foetus before birth, except by supposing their ova to have passed through the circulating vessels of the mother, and by this means been conveyed to the foetus.

The chance of an ovum being placed in a situation where it will be hatched, and the young find convenient subsistence, must be very small; hence the necessity for their being very prolific. If they had the same powers of being prolific which they now have, and their ova were afterwards very readily hatched, then the multiplication of these animals would be immense, and become a nuisance to the other parts of the creation.

Another mode of increase allowed to tænia (if we may call it increase) is by an addition to the number of their joints. If we consider the individual joints as distinct beings, it is so; and when we reflect upon the power of generation given to each joint, it makes this conjecture the more probable. We can hardly suppose that an ovum of a tænia, which at its full growth is 30 feet long, and composed of

400 joints, contained a young tænia composed of this number of pieces; but we have seen young tænia not half a foot long, and not possessed of 50 joints, which still were entire worms. We have also many reasons to believe, that when a part of this animal is broken off from the rest, it is capable of forming a head for itself, and becomes an independent being. The simple construction of the head makes its regeneration a much more easy operation than that of the tails and feet of lizards, which are composed of bones and complicated vessels; but this last operation has been proved by the experiments of Spallanzani and many other naturalists.

When intestinal worms produce a diseased state of the animal's body which they inhabit, various remedies are advised for removing them; many of which are ineffectual, and others very injurious by the violence of their operation. Draughts purges seem to operate upon tænia, partly by irritating the external surface of their bodies, so as to make them quit their holds, and partly by the violent contractions produced in the intestine, which may sometimes divide the bodies of tænia, and even kill them by bruising. Mr Carlisle proposes the trial of a simple remedy, which (*à priori*) promises to be successful; namely, small shocks of electricity passed frequently through the regions of the abdomen; the lives of the lower orders of animals seeming to be easily destroyed by such shocks of electricity as do not injure the larger and more perfect animals.

Plate DI. fig. 1. shows the head of the tænia magnified; the mouth is in the middle of the circular plane, where the body becomes flattened and broad; there are two hollow tubercles represented by the two dark shaded spots. Fig. 2. is the same head, of its natural bigness, and which belonged to a tænia 20 feet in length. Fig. 3. shows the alimentary canals, in a portion of the same tænia, of their natural bigness. The dark shaded undulating lines are the alimentary canals, which are seen to their full extent in this portion of the worm. Fig. 4. shows the middle system of vessels, in two joints, which are represented by the dark lines. Fig. 5. shows two joints, from one side of which a slip was torn down to show the vessels underneath, and also the direction of the fibres in the slip, which are accumulated into little fasciculi like muscular fibres. Fig. 6. exhibits three joints, having the ducts leading from the lateral oscula injected; the dark transverse lines leading from each osculum show the size, direction, and extent of these ducts. Fig. 7. shows the edge of two joints turned forwards, and the appearance of the oscula in this point of view. Fig. 8. represents the whole of these canals in their relative situations.

For a more complete account of the tænia, we must refer to Mr Carlisle's ingenious paper in the Linnæan Transactions.

TAFFETY or TAFFETA, in commerce, a fine smooth silk stuff, remarkably glossy. There are taffeties of all colours, some plain, and others striped with gold, silver, &c. others chequered, others flowered, &c. according to the fancy of the workmen.

TAGARA, a city of ancient India, the metropolis of a large district called *Ariaca*, which comprehended the greatest part of the Subah of Aurangabad, and the southern part of Concan. Arrian says, that it was situated about ten days journey to the eastward of Pultanah; which, according to the rate of travelling in that country with loaded carts, might be about 100 British miles. This fixes its situation at Deoghiri, a place of great antiquity, and famous through all India on account of the pagodas of Eloufa. It is now called *Doulet-abad*.

TAGETES, MARYGOLD, in botany: A genus of plants belonging to the class of *synanthesia*, and order of *polygamia superflua*; and in the natural system ranging under the 49th order,

Tænia
Tageta

order,

order, Composite. The receptacle is naked; the pappus consists of five erect awns or beards; the calyx is monophyllous, quinque-dentate, and tubular; and there are four persistent florets of the ray. There are three species, the *patula*, *erecta*, and *minuta*; of which the two first have been cultivated in the British gardens, at least, since the year 1506, for it is mentioned in Gerard's Herbal, which was published that year. They are both natives of Mexico.

The *erecta*, or African marygold, has a stem subdivided and spreading, and has formed itself into a great many varieties: 1. Pale yellow, or brimstone colour, with single, double, and fistulous flowers. 2. Deep yellow, with single, double, and fistulous flowers. 3. Orange-coloured, with single, double, and fistulous flowers. 4. Middling African, with orange-coloured flowers. 5. Sweet-scented African. These are all very subject to vary; so that unless the seeds are very carefully saved from the finest flowers, they are apt to degenerate: nor should the same seeds be too long sown in the same garden, for the same reason; therefore, those who are desirous to have these flowers in perfection should exchange their seeds with some person of integrity at a distance, where the soil is of a different nature, at least every other year. If this is done, the varieties may be continued in perfection. This plant is so well known as to need no description. It flowers from the beginning of July till the frost puts a stop to it.

The *patula* has a simple erect stem, and the peduncles are scaly and multiflorous.

It has been long in the British gardens, where it is distinguished from the first by the title of *French marygold*. Of this there are several varieties, some of which have much larger flowers than others, and their colour varies greatly: there are some which are beautifully variegated, and others quite plain; but as these are accidents arising from culture, so they do not merit farther distinction; for we have always found that seeds saved from the most beautiful flowers will degenerate, especially if they are sown in the same garden for two or three years together, without changing the seed.

These plants have a strong disagreeable scent, especially when handled; for which reason they are not so greatly esteemed for planting near habitations: but the flowers of the sweet-scented sort being more agreeable, are generally preferred, especially for planting in small gardens.

TAGUS, the largest river of Spain; which, taking its rise on the confines of Arragon, runs south-west through the provinces of New Castile and Estremadura; and passing by the cities of Araujuez, Toledo, and Alcantara, and then crossing Portugal, forms the harbour of Lisbon, at which city it is about three miles over; and about eight or ten miles below this it falls into the Atlantic ocean.

TAHOERWA, one of the Sandwich islands. It is small, destitute of wood, and its soil sandy and unfertile. It is situated in north latitude 20° 38', in east longitude 203° 27'. See *Cook's Discoveries*, vol. v. n° 88. and *SANDWICH-Islands*.

TAHOORA, one of the Sandwich islands in the South Sea. It is uninhabited, and lies in north latitude 21° 43', and in east longitude 199° 36'. See *SANDWICH-Islands*.

TAJACU, or PECCARY, in zoology, a species of hog. See *Sus*.

TAI-OUAN, the Chinese name of the island of Formosa. See *FORMOSA*.—Tai-ouan is also the name of the capital of the island.

TAIL, the train of a beast, bird, or fish; which in land animals serves to drive away flies, &c. and in birds and fishes to direct their course, and assist them in ascending or descending in the air or water.

TAIL, or FEE-TAIL, in law, is a conditional estate or fee, opposed to *fee-simple*. See *Fee*. Tail.

A conditional fee, at the common law, was a fee restrained to some particular heirs exclusive of others: as to the heirs of a man's body, by which only his lineal descendants were admitted, in exclusion of collateral heirs; or to the heirs male of his body, in exclusion both of collaterals and lineal females also. It was called a *conditional fee*, by reason of the condition expressed or implied in the donation of it, that if the donee died without such particular heirs, the land should revert to the donor. For this was a condition annexed by law to all grants whatsoever, that on failure of the heirs specified in the grant, the grant should be at an end, and the land return to its ancient proprietor. Such conditional fees were strictly agreeable to the nature of feuds, when they first ceased to be mere estates of life, and were not yet arrived to be absolute estates in fee-simple.

With regard to the condition annexed to these fees by the common law, it was held, that such a gift (to a man and the heirs of his body) was a gift upon condition that it should revert to the donor if the donee had no heirs of his body; but if he had, it should then remain to the donee. They therefore called it a *fee-simple* on condition that he had issue. Now we must observe, that when any condition is performed, it is thenceforth entirely gone; and the thing to which it was before annexed becomes absolute and wholly unconditional. So that as soon as the grantee had any issue born, his estate was supposed to become absolute by the performance of the condition; at least for these three purposes: 1. To enable the tenant to alienate the land, and thereby to bar not only his own issue, but also the donor, of his interest in the reversion. 2. To subject him to forfeit it for treason: which he could not do till issue born longer than for his own life, lest thereby the inheritance of the issue and reversion of the donor might have been defeated. 3. To empower him to charge the land with rents, commons, and certain other encumbrances, so as to bind his issue. And this was thought the more reasonable, because, by the birth of issue, the possibility of the donor's reversion was rendered more distant and precarious: and his interest seems to have been the only one which the law, as it then stood, was solicitous to protect, without much regard to the right of succession intended to be vested in the issue. However, if the tenant did not in fact alienate the land, the course of descent was not altered by this performance of the condition: for if the issue had afterwards died, and then the tenant or original grantee had died, without making any alienation, the land, by the terms of the donation, could descend to none but the heirs of his body; and therefore, in default of them, must have reverted to the donor. For which reason, in order to subject the lands to the ordinary course of descent, the donees of these conditional fee-simples took care to alienate as soon as they had performed the condition by having issue; and afterwards repurchased the lands, which gave them a fee-simple absolute, that would descend to the heirs general, according to the course of the common law. And thus stood the old law with regard to conditional fees: which things, says Sir Edward Coke, though they seem ancient, are yet necessary to be known, as well for the declaring how the common law stood in such cases, as for the sake of annuities, and such-like inheritances, as are not within the statutes of entail, and therefore remain as the common law. The inconveniences which attended these limited and fettered inheritances were probably what induced the judges to give way to this subtle finess (for such it undoubtedly was), in order to shorten the duration of these conditional estates. But, on the other hand, the nobility, who were willing to perpetuate their

possessions in their own families, to put a stop to this practice, procured the statute of Westminster the second (commonly called the statute *de donis conditionalibus*) to be made; which paid a greater regard to the private will and intentions of the donor, than to the propriety of such intentions, or any public considerations whatsoever. This statute revived in some sort the ancient feudal restraints which were originally laid on alienations, by enacting, that from thenceforth the will of the donor be observed; and that the tenements so given (to a man and the heirs of his body) should at all events go to the issue, if there were any; or if none, should revert to the donor.

Upon the construction of this act of parliament, the judges determined that the donee had no longer a conditional fee simple, which became absolute and at his own disposal the instant any issue was born; but they divided the estate into two parts, leaving in the donee a new kind of particular estate, which they denominated a *fee-tail*; and vesting in the donor the ultimate fee-simple of the land, expectant on the failure of issue; which expectant estate is what we now call a *reversion*. And hence it is that Littleton tells us, that tenant in fee-tail is by virtue of the statute of Westminster the second. The expression *fee-tail*, or *feodum talliatum*, was borrowed from the feudists (see *Crag. l. s. t. 10. § 24, 25.*), among whom it signified any mutilated or truncated inheritance, from which the heirs general were cut off; being derived from the barbarous verb *taliare*, to cut; from which the French *tailleur* and the Italian *tagliare* are formed, (*Suolm. Gloss. 531.*)

Having thus shown the original of estates tail, we now proceed to consider what things may or may not be entailed under the statute *de donis*. Tenements is the only word used in the statute; and this Sir Edward Coke expounds to comprehend all corporeal hereditaments whatsoever; and also all incorporeal hereditaments which favour of the realty, that is, which issue out of corporeal ones, or which concern or are annexed to or may be exercised within the same; as rents, estovers, commons, and the like. Also offices and dignities, which concern lands, or have relation to fixed and certain places, may be entailed. But mere personal chattels, which favour not at all of the realty, cannot be entailed. Neither can an office, which merely relates to such personal chattels; nor an annuity, which charges only the person, and not the lands of the grantor. But in these last, if granted to a man and the heirs of his body, the grantee hath still a fee conditional at common law as before the statute, and by his alienation may bar the heir or reversioner. An estate to a man and his heirs for another's life cannot be entailed; for this is strictly no estate of inheritance, and therefore not within the statute *de donis*. Neither can a copyhold estate be entailed by virtue of the statute; for that would tend to encroach upon and restrain the will of the lord; but, by the special custom of the manor, a copyhold may be limited to the heirs of the body; for here the custom ascertains and interprets the lord's will.

As to the several species of estates-tail, and how they are respectively created; they are either general or special. Tail-general is where lands and tenements are given to one, and the heirs of his body begotten: which is called *tail-general*; because, how often soever such donee in tail be married, his issue in general, by all and every such marriage, is, in successive order, capable of inheriting the estate-tail *per formam doni*. Tenant in *tail-special* is where the gift is restrained to certain heirs of the donee's body, and does not go to all of them in general. And this may happen several ways. We shall instance in only one; as where lands and tenements are given to a man and the heirs of his body, on Mary his now wife to be begotten. Here no issue can in-

herit but such special issue as is engendered between them two; not such as the husband may have by another wife; and therefore it is called *special tail*. And here we may observe, that the words of inheritance (to him and his heirs) give him an estate in fee; but they being heirs to be by him begotten, this makes it a fee-tail; and the person being also limited, on whom such heirs shall be begotten (viz. Mary his present wife), this makes it a fee-tail special.

Estates in general and special tail are farther diversified by the distinction of sexes in such entails; for both of them may either be in tail male or tail female. As if lands be given to a man, and his heirs-male of his body begotten, this is an estate in tail male general; but if to a man, and the heirs-female of his body on his present wife begotten, this is an estate in tail female special. And in case of an entail male, the heirs-female shall never inherit, nor any derived from them; nor, *e converso*, the heirs-male in case of a gift in tail female. Thus, if the donee in tail male hath a daughter, who dies leaving a son, such grandson in this case cannot inherit the estate tail; for he cannot deduce his descent wholly by heirs-male. And as the heir-male must convey his descent wholly by males, so must the heir-female wholly by females. And therefore if a man hath two estates-tail, the one in tail male and the other in tail female, and he hath issue a daughter, which daughter hath issue a son; this grandson can succeed to neither of the estates, for he cannot convey his descent wholly either in the male or female line.

As the word *heirs* is necessary to create a fee, so, in farther imitation of the strictness of the feudal donation, the word *body*, or some other words of procreation, are necessary to make it a fee-tail, and ascertain to what heirs in particular the fee is limited. If, therefore, either the words of inheritance or words of procreation be omitted, albeit the others are inserted in the grant, this will not make an estate-tail. As if the grant be to a man and the issue of his body, to a man and his seed, to a man and his children or offspring; all these are only estates for life, there wanting the words of inheritance, "his heirs." So, on the other hand, a gift to a man, and his heirs male or female, is an estate in fee-simple and not in fee-tail; for there are no words to ascertain the body out of which they shall issue. Indeed, in last wills and testaments, wherein greater indulgence is allowed, an estate-tail may be created by a devise to a man and his seed, or to a man and his heirs-male, or by other irregular modes of expression.

There is still another species of entailed estates, now indeed grown out of use, yet still capable of subsisting in law; which are estates *in libero matrimonio*, or FRANKMARRIAGE. See that article.

The incidents to a tenancy in tail, under the statute Westminster 2. are chiefly these: 1. That a tenant in tail may commit waste on the estate tail, by selling timber, pulling down houses, or the like, without being impeached or called to account for the same. 2. That the wife of the tenant in tail shall have her dower, or thirds, of the estate-tail. 3. That the husband of a female tenant in tail may be tenant by the curtesy of the estate-tail. 4. That an estate-tail may be barred, or destroyed, by a fine, by a common recovery, or by lineal warranty descending with assets to the heir. See ASSETS.

Thus much for the nature of estates-tail: the establishment of which family-law (as it is properly styled by Pigott) occasioned infinite difficulties and disputes. Children grew disobedient when they knew they could not be set aside: farmers were ousted of their leases made by tenants in tail; for if such leases had been valid, then, under colour of long leases, the issue might have been virtually disinherited: creditors were defrauded of their debts; for, if

1. a tenant in tail could have charged his estate with their payment, he might also have defeated his issue, by mortgaging it for as much as it was worth: innumerable latent entails were produced to deprive purchasers of the lands they had fairly bought; of suits in consequence of which, our ancient books are full: and treasons were encouraged, as estates tail were not liable to forfeiture longer than for the tenant's life. So that they were justly branded as the source of new contentions and mischiefs unknown to the common law; and almost universally considered as the common grievance of the realm. But as the nobility were always fond of this statute, because it preserved their family-estates from forfeiture, there was little hope of procuring a repeal by the legislature; and therefore, by the connivance of an active and politic prince, a method was devised to evade it.

About 200 years intervened between the making of the statute *de donis*, and the application of common recoveries to this intent, in the 12th year of Edward IV.; which were then openly declared by the judges to be a sufficient bar of an estate tail. For though the courts had, so long before as the reign of Edward III. very frequently hinted their opinion that a bar might be effected upon these principles, yet it was never carried into execution; till Edward IV. observing (in the disputes between the houses of York and Lancaster) how little effect attainders for treason had on families whose estates were protected by the sanctuary of entails, gave his countenance to this proceeding, and suffered Taltarum's case to be brought before the court: wherein, in consequence of the principles then laid down, it was in effect determined, that a common recovery suffered by tenant in tail should be an effectual destruction thereof. These common recoveries are fictitious proceedings, introduced by a kind of *pia fraus*, to elude the statute *de donis*, which was found so intolerably mischievous, and which yet one branch of the legislature would not then consent to repeal: and that these recoveries, however clandestinely begun, are now become by long use and acquiescence a most common assurance of lands; and are looked upon as the legal mode of conveyance, by which a tenant in tail may dispose of his lands and tenements: so that no court will suffer them to be shaken or reflected on, and even acts of parliament have by a side-wind countenanced and established them.

This expedient having greatly abridged estates-tail with regard to their duration, others were soon invented to strip them of other privileges. The next that was attacked was their freedom from forfeitures for treason. For, notwithstanding the large advances made by recoveries, in the compass of about threescore years, towards unfettering these inheritances, and thereby subjecting the lands to forfeiture, the rapacious prince then reigning, finding them frequently resettled in a similar manner to suit the convenience of families, had address enough to procure a statute, whereby all estates of inheritance (under which general words estates-tail were covertly included) are declared to be forfeited to the king upon any conviction of high-treason.

The next attack which they suffered, in order of time, was by the statute 32 Hen. VIII. c. 28. whereby certain leases made by tenants in tail, which do not tend to the prejudice of the issue, were allowed to be good in law, and to bind the issue in tail. But they received a more violent blow in the same session of parliament, by the construction put upon the statute of fines, by the statute 32 Hen. VIII. c. 36. which declares a fine duly levied by tenant in tail to be a complete bar to him and his heirs, and all other persons claiming under such entail. This was evidently agreeable to the intention of Henry VII. whose policy it was (before common recoveries had obtained their full strength and authority) to lay the road as open as possible to the aliena-

tion of landed property, in order to weaken the overgrown power of his nobles. But as they, from the opposite reasons, were not easily brought to consent to such a provision, it was therefore couched, in his act, under covert and obscure expressions. And the judges, though willing to construe that statute as favourably as possible for the defeating of entailed estates, yet hesitated at giving fines so extensive a power by mere implication, when the statute *de donis* had expressly declared that they should not be a bar to estates-tail. But the statute of Henry VIII. when the doctrine of alienation was better received, and the will of the prince more implicitly obeyed than before, avowed and established that intention. Yet, in order to preserve the property of the crown from any danger of infringement, all estates-tail created by the crown, and of which the crown has the reversion, are excepted out of this statute. And the same was done with regard to common recoveries, by the statute 31 and 35 Hen. VIII. c. 20. which enacts, that no feigned recovery had against tenants in tail, where the estate was created by the crown, and the remainder or reversion continues still in the crown, shall be of any force and effect. Which is allowing, indirectly and collaterally, their full force and effect with respect to ordinary estates tail, where the royal prerogative is not concerned.

Lastly, by a statute of the succeeding year, all estates-tail are rendered liable to be charged for payment of debts due to the king by record or special contract; as since, by the bankrupt-laws, they are also subjected to be sold for the debts contracted by a bankrupt. And, by the construction put on the statute 43 Eliz. c. 4. an appointment by tenant in tail of the lands entailed to a charitable use is good without fine or recovery.

Estates-tail being thus by degrees unfettered, are now reduced again to almost the same state, even before issue born, as conditional fees were in at common law, after the condition was performed by the birth of issue. For, first, the tenant in tail is now enabled to alienate his lands and tenements by fine, by recovery, or by certain other means; and thereby to defeat the interest as well of his own issue, though unborn, as also of the reversioner, except in the case of the crown: secondly, he is now liable to forfeit them for high treason: and, lastly, he may charge them with reasonable leases, and also with such of his debts as are due to the crown on specialties, or have been contracted with his fellow subjects in a course of extensive commerce.

TAILZIE, in Scots law, the same with TAIL. See LAW, N^o clxxx. 9.

TALAPOINS or TALOPINS, priests of Siam.—They enjoy great privileges, but are enjoined celibacy and austerity of life. They live in monasteries contiguous to the temples: and what is singular, any one may enter into the priesthood, and after a certain age may quit it to marry, and return to society. There are talapoinesses too, or nuns, who live in the same convents, but are not admitted till they have passed their fortieth year. The talapoins educate children; and at every new and full moon explain the precepts of their religion in their temples; and during the rainy season they preach from six in the morning till noon, and from one in the afternoon till five in the evening. They dress in a very mean garb, go bareheaded and barefooted; and no person is admitted among them who is not well skilled in the Baly language.

They believe that the universe is eternal; but admit that certain parts of it, as this world, may be destroyed and again regenerated. They believe in a universal pervading spirit, and in the immortality and transmigration of the soul; but they extend this last doctrine, not only to all animals, but to vegetables and rocks. They have their good and

Tail
||
Tala; oirs.

Talc. evil genii, and particular local deities, who preside over forests and rivers, and interfere in all sublunary affairs.

For the honour of human nature, we are happy to find so pure a system of morality prevail among these people: It not only forbids its followers to do ill, but enjoins the necessity of doing good, and of stifling every improper thought or criminal desire.

Those who wish to peruse a more particular account of the talapoins, may consult *Voyage de M. de la Loubere*; Sketches relating to the History, &c. of the Hindoos; or Payne's Geography.

TALC, in mineralogy, a species of fossil arranged under the magnesian earths. In Magellan's edition of Cronstedt's Mineralogy, it is considered as a species of MICA, and has accordingly been mentioned by us under that article. On the other hand, Dr Kirwan has classed the mica under the siliceous earths, while he places talc under the magnesian. According to the analysis of Dr Kirwan, "talc consists of pure magnesia, mixed with nearly twice its weight of silica, and less than its own weight of argil." It is composed of broad, flat, and smooth lamina, or plates. There are two varieties of it, the Venetian talc and Muscovy talc; for the difference of which, see the article MICA.

The Venetian talc has not derived its name from being a production of the territories of Venice (for it is not often to be met with in that country), but probably from being an article of Venetian commerce. It abounds in England, Norway, Hungary, Bohemia, Spain, and in many countries of Asia. Venice talc, with half its weight of alkaline salt, may, in a strong fire, be brought into perfect fusion, though not to perfect transparency: with equal its weight, or less, of borax, it runs into a beautiful, pellucid, greenish yellow glass. Talc does not melt with any other earth, nor even bake or cohere with any but the argillaceous: Mixtures of it with them all are nevertheless brought into fusion by a remarkably less quantity of saline matter than the ingredients separately would require. Thus equal parts of talc and chalk, with only one fourth their weight of borax, melt in no very vehement heat into a fine transparent greenish glass, of considerable hardness and great lustre. On substituting gypseous earths to chalk, the fusion was as easy, and the glass as beautiful; in colour not green, but yellow like the topaz. Talc, with half its weight of sand, and a quantity of nitre equal to both, yielded also a transparent topaz yellow glass. Several further experiments on talc may be seen in a memoir by Mr Pott in the *Mem. de l'Acad. de Berlin*, 1746.

Muscovy talc, called also *lapis specularis*, is found in many parts. The island of Cyprus abounds with it. It is very common also in Russia, and has of late been discovered to abound in the Alps, the Apennines, and many of the mountains of Germany. It is imported in large quantities into England, and is used by the lanthorn-makers instead of horn in their nicer works; by the painters to cover miniature pictures; and by the microscope-makers to preserve small objects for viewing by glasses. The ancients used it instead of glass in their windows. Some take the lapis specularis to have been a species of gypsum, and composed of the acid of vitriol and calcareous earth. It came into use at Rome in the age of Seneca; and soon after its introduction was applied not only to lighten apartments, but to protect fruit-trees from the severity of the weather; and it is recorded, that the emperor Tiberius was enabled, principally by its means, to have cucumbers at his table during almost every month in the year. Dr Watson apprehends it is still used in some countries in the place of glass: however, it is well known, that it was so used in the time of Agricola; for he mentions† two churches in Saxony which were lighted by it.

Agricola esteemed it to have been a species of plaster-stone; and in speaking of it he remarks, that though it could bear, without being injured, the heat of summer and the cold of winter, yet the largest masses of it were wasted by the rain. It differs from plaster-stone in this property, that it does not, after being calcined and wetted with water, swell and concrete into a hard stony substance*.

Although we have treated of Muscovy talc and lapis specularis as the same, we are not ignorant that a distinction has been made between them by some chemists: but as we have found a greater degree of confusion on this subject in several valuable systems of mineralogy than we had reason to expect, we continue the old names as formerly, till a more satisfactory analysis make it proper to apply them differently.

Talc is employed, in those places where it is found in any considerable quantity, in compositions for earthen vessels; and by some for tests and cupels. From its smoothness, unctuousity, and brightness, it has been greatly celebrated as a cosmetic; and the chemists have submitted it to a variety of operations, for procuring from it oils, salts, tinctures, magisteries, &c. for that intention. But all their labours have been in vain; and all the preparations sold under the name of talc have either contained nothing of that mineral, or only a fine powder of it.

TALENT, signifies both a weight and a coin very common among the ancients, but very different among different nations.

The common Attic talent of weight contains 60 Attic minæ, or 6000 Attic drachmæ; and weighed, according to Dr Arbuthnot, 56 lbs. 11 oz. 17½ gr. English troy weight. There was another Attic talent, by some said to consist of 80, by others of 100 minæ. The Egyptian talent was 80 minæ; the Antiochian also 80; the Ptolemaic of Cleopatra 86½; that of Alexandria 96; and the Insular talent 120. In the valuation of money, the Grecian talent, according to Dr Arbuthnot, was equal to 60 minæ, or, reckoning the mina at L. 3 : 4 : 7, equal to L. 193, 158: The Syrian talent in this valuation consisted of 15 Attic minæ; the Ptolemaic of 20; the Antiochian of 60; the Euboic of 60; the Babylonian of 70; the Greater Attic of 80; the Tyrian of 80; the Egeian of 100; the Rhodian of 100; and the Egyptian of 80 minæ.

There is another talent much more ancient, which Dr Arbuthnot calls the *Homerian talent* of gold, which seems to have weighed six Attic drachms or three darics, a daric weighing very little more than a guinea. According to this talent, some reckon the treasure of king David, particularly that mentioned 1 Chron. xxii 14. which, according to the common reckoning, would amount in gold talents to the value of L. 547,500,000, and the silver to above L. 342,000,000; or, reckoning according to the decuple proportion of gold to silver, the two sums would be equal. As David reigned in Judæa after the siege of Troy, it is not improbable that Homer and he might use the same numeral talent of gold.

Among the Romans there were two kinds of talents, the *little* and the *great* talent: the little was the common talent; and whenever they say simply *talentum*, they are to be understood of this. The little talent was 60 minæ or Roman pounds; the mina or pound estimated at 100 drachmæ or denarii: it was also estimated at 24 great sesterces, which amounted to 60 pounds.

The great talent exceeded the less by one-third part. Budæus computes, that the little talent of silver was worth L. 75 Sterling, and the greater L. 99 : 6 : 8 Sterling. The greater of gold was worth L. 1125 Sterling.

TALENT, as a species of money, among the Hebrews,

Hist. Hij.
of Isrl.
p. 72.

Ep. 90.

De Nat.
Foss. lib. 5.
p. 257.

was sometimes used for a gold coin, the same with the shekel of gold, called also *stater*, and weighing only 4 drachms. The Hebrews reckoned by these talents as we do by pounds, &c. Thus a milliou of gold, or million of talents of gold, among them, was a million of shekels or nummi; the nummus of gold being the same weight with the shekel, viz. four drachms.

But the Hebrew talent weight of silver, which they called *shear*, was equivalent to that of 3000 shekels, or 113 lb. 10 oz. 1 dwt. 10 $\frac{1}{2}$ gr. English Troy weight, according to Arbuthnot's computation.

TALIACOTIUS (Gaspar), chief surgeon to the great duke of Tuscany, was born at Bouonia in Italy in 1553. He wrote a Latin treatise intitled *Chirurgia Nota de Curtis Membris*, in which he teaches the art of engrafting noses, ears, lips, &c. giving representations of the instruments and proper bandages; though many are of opinion that he never put his art in practice. However, his doctrine is not singular; for he shows that Alexander Benedictus, a famous chirurgical writer, described the operation before.

TALLIO (*lex talionis*), a species of punishment in the Mosaic law, whereby an evil is returned similar to that committed against us by another; hence that expression, "Eye for eye, tooth for tooth." This law was at first inserted in the 12 tables amongst the Romans; but afterwards set aside, and a power given to the prætor to fix upon a sum of money for the damage done.

TALISMANS, magical figures cut or engraved with superstitious observations on the characterisms and configurations of the heavens, to which some astrologers have attributed wonderful virtues, particularly that of calling down celestial influences. The talismans of Samothrace, so famous of old, were pieces of iron formed into certain images, and set in rings; these were esteemed preservatives against all kinds of evils. There were likewise talismans taken from vegetables, and others from minerals.

TALLAGE (*tallagium*), from the French *taillé*, is metaphorically used for a part or share of a man's substance carved out of the whole, paid by way of tribute, toll, or tax.

TALLOW, in commerce, the fat of certain animals melted and clarified. It is procured from most animals, but chiefly from bullocks, sheep, hogs, and bears. Some kinds of tallow are used as unguents in medicine, some for making soap and dressing leather, and some for making candles. See CHEMISTRY, D 1429.

TALLOW Tree. See CROTON.

TALLY, is a stick cut in two parts, on each whereof is marked, with notches or otherwise, what is due between debtor and creditor, as now used by brewers, &c. And this was the ancient way of keeping all accounts, one part being kept by the creditor, the other by the debtor, &c. Hence the tallier of the exchequer, whom we now call the *teller*. But there are two kinds of tallies mentioned in our statutes to have been long used in the exchequer. The one is termed *tallies of debt*, which are in the nature of an acquittance for debts paid to the king, on the payment whereof these tallies are delivered to the debtors, who carrying them to the clerk of the pipe office, have there an acquittance in parchment for their full discharge. The other are *tallies of reward* or allowance, being made to the sheriffs of counties as a recompense for such matters as they have performed to their charge, or such money as is cast upon them in their accounts of course, but not leviable, &c. In the exchequer there is a tally-court, where attend the two deputy-chamberlains of the exchequer and the tally-cutter: and a tally is generally the king's acquittance for money paid or lent, and has written on it words proper to express on what occasion the money is received.

TALLY-Man, a person that sells or lets goods, clothes, &c. Talmud. to be paid by so much a-week.

TALMUD, a collection of Jewish traditions. There are two works which bear this name, the Talmud of Jerusalem, and the Talmud of Babylon. Each of these are composed of two parts; the Mishna, which is the text, and is common to both, and the Gemara or commentary. See MISHNA and GEMARA.

The Mishna, which comprehends all the laws, institutions, and rules of life which, beside the ancient Hebrew scriptures, the Jews thought themselves bound to observe, was composed, according to the unanimous testimony of the Jews, about the close of the second century. It was the work of Rabbi Jehuda (or Juda) Hakkadosh, who was the ornament of the school at Tiberias, and is said to have occupied him forty years. The commentaries and additions which succeeding Rabbis made were collected by Rabbi Jochanan Ben Eliezer, some say in the 5th, others say in the 6th, and others in the 7th century, under the name of *Gemara*, that is, *completion*; because it completed the Talmud. A similar addition was made to the Mishna by the Babylonish doctors in the beginning of the 6th century according to Enfeld, and in the 7th according to others.

The Mishna is divided into six parts, of which every one which is intitled *order* is formed of treatises, every treatise is divided into chapters, and every chapter into mishnas or aphorisms. In the *first* part is discussed whatever relates to seeds, fruits, and trees: in the *second* seals: in the *third* women, their duties, their divorces, marriages, divorces, contracts, and nuptials: in the *fourth* are treated the damages or losses sustained by beasts or men, of things found, deposits, usuries, rents, farms, partnerships in commerce, inheritance, sales and purchases, oaths, witnesses, arrests, idolatry; and here are named those by whom the oral law was received and preserved: in the *fifth* part are noticed what regards sacrifices and holy things: and the *sixth* treats on purifications, vessels, furniture, clothes, houses, leprosy, baths, and numerous other articles. All this forms the Mishna.

As the learned reader may wish to obtain some notion of rabbinical composition and judgment, we shall gratify his curiosity sufficiently by the following specimen: "Adam's body was made of the earth of Babylon, his head of the land of Israel, his other members of other parts of the world. R. Meir thought he was compact of the earth gathered out of the whole earth; as it is written, *thine eyes did see my substance*. Now it is elsewhere written, *the eyes of the Lord are over all the earth*. R. Aha expressly marks the twelve hours in which his various parts were formed. His stature was from one end of the world to the other; and it was for his transgression that the Creator, laying his hand in anger on him, lessened him; for before (says R. Eleazar), 'with his hand he reached the firmament.' R. Jehuda thinks his sin was hereby; but R. Isaac thinks that 'it was nourishing his foreskin.'

The Talmud of Babylon is most valued by the Jews; and this is the book which they mean to express when they talk of the Talmud in general. An abridgment of it was made by Maimonides in the 12th century, in which he rejected some of its greatest absurdities. The Gemara is stuffed with dreams and chimeras, with many ignorant and impertinent questions, and the style very coarse. The Mishna is written in a style comparatively pure, and may be very useful in explaining passages of the New Testament where the phraseology is similar. This is indeed the only use to which Christians can apply it; but this renders it valuable. Lightfoot has judiciously availed himself of such information as he could derive from it. Some of the popes, with a bar-

Talpa
||
Tamarin-
dus.

barous zeal, and a timidity of spirit for the success of the Christian religion, which the belief of its divinity can never excuse, ordered great numbers of the Talmud to be burned. Gregory IX. burned about 20 cart-loads, and Paul IV. ordered 12,000 copies of the Talmud to be destroyed.

The last edition of the Talmud of Babylon, printed at Amsterdam, is in 12 vols folio. The Talmud of Jerusalem is in one large folio.

TALPA, the MOLE; a genus of quadrupeds belonging to the order of *feræ* and class of *mammalia*. It has six unequal foreteeth in the upper jaw, and eight in the lower; one tusk on each side in each jaw; seven grinders on each side above, and six below. There are seven species; the European, the flava or American, the cristata, longicaudata, fusca, rubra, and aurea.

The European mole is the only species of this animal found in Britain. There are several varieties of it; the black, the variegated, the white, and the grey mole. This species inhabits the whole of Europe except Ireland, where it is said no moles are found. It is also common in the northerly parts of Asia and Africa. It chiefly frequents moist fields that are exposed to the sun, meadows, and gardens; through these it constructs subterraneous roads or galleries in every direction in search of worms, on which and the larvæ of insects it feeds, and not at all on vegetables, though it does great damage by loosening the roots of plants. It is most active in its operations before rain, because then the worms are in motion. The penis of the male is exceedingly long in proportion; they seem to pair and propagate in spring, the female bringing four or five young at a birth, which are placed in nests made of moss, leaves, and dried grass, under the largest hillocks of the field; these are constructed with wonderful ingenuity, consisting of an interior hillock, surrounded with a ditch, which communicates with several galleries, on purpose to carry off the moisture; and the nest is covered over with a dome of earth, like the flat arch of an oven. Moles are destroyed by means of a paste composed of palma-christi and white hellebore, or by flooding the fields which they infest; though, in the latter case, they sometimes escape by ascending trees.

This species is five inches and three quarters in length, and its tail is about one inch long. It has a large head, without any external ears, and eyes so very small and so completely hid in the fur as to make it vulgarly believed that it has none. As it lives entirely below ground, it has certainly no occasion for eyes like other quadrupeds; and as it probably finds its food by its sense of smell, which is acute, its eyes may serve merely as a safeguard to warn it when it happens to emerge from the ground to return to its subterraneous dwelling. This warning may be given by the light falling upon its eyes, which may produce a painful sensation. For the truth of this conjecture, however, we must refer to the anatomist, who might easily determine, from the structure of the eyes, what purpose they are fitted to serve.

TAMANDAU, in zoology. See MYRMECOPHAGA.

TAMARINDUS, the TAMARIND-TREE, in botany: A genus of plants arranged by Linnæus under the class of *triandria* and order of *monogynia*; but Woodville, Schreber, and other late botanists, have found that it belongs to the class of *monodelphia* and order of *triandria*. In the natural

system it is ranked under the *lomentaceæ*. There is only one species, the *indica*, which is a native of both Indies, of America, of Arabia, and Egypt, and was cultivated in Britain before the year 1633.

The tamarind-tree rises to the height of 30 or 40 feet, sending off numerous large branches, which spread to a considerable extent, and have a beautiful appearance; the trunk is erect, and covered with rough bark, of a greyish or ash-colour; the leaves are small and pinated, and of a yellowish green colour: the flowers resemble the papilionaceous kind, and grow in lateral clusters: the calyx consists of four leaves, and the corolla of three petals, which are of a yellowish hue, and are beautifully diversified with red veins: the fruit is a pod of a roundish compressed form, from three to five inches long, containing two, three, or four seeds, lodged in a dark pulpy matter. The flowers appear, according to Jacquin, in October and November; but, according to Dr Wright, they continue during the whole of June and July, and then drop off.

The pulp of the tamarind, with the seeds connected together by numerous tough strings or fibres, are brought to us freed from the outer shell, and commonly preserved in syrup. According to Long, tamarinds are prepared for exportation at Jamaica in the following manner: "The fruit or pods are gathered (in June, July, and August) when full ripe, which is known by their fragility or easy breaking on small pressure between the finger and thumb. The fruit, taken out of the pod, and cleared from the shelly fragments, is placed in layers in a cask; and boiling syrup, just before it begins to granulate, is poured in, till the cask is filled: the syrup pervades every part quite down to the bottom, and when cool the cask is headed for sale." He observes, that the better mode of preserving this fruit is with sugar, well clarified with eggs, till a transparent syrup is formed, which gives the fruit a much pleasanter flavour: but as a principal medicinal purpose of the pulp depends upon its acidity, which is thus counteracted by the admixture of sugar, it would therefore be of more utility if always imported here in the pods. The fruit produced in the East Indies is more esteemed than that of the West, and easily to be distinguished by the greater length of the pods, and the pulp being dryer and of a darker colour.

Uses. This fruit, the use of which was first learned of the Arabians, contains a larger proportion of acid, with the saccharine matter, than is usually found in the *fructus acidodulcis*, and is therefore not only employed as a laxative, but also for abating thirst and heat in various inflammatory complaints, and for correcting putrid disorders, especially those of a bilious kind; in which the cathartic, antiseptic, and refrigerant qualities of the fruit have been found equally useful. When intended merely as a laxative, it may be of advantage to join it with manna, or purgatives of a sweet kind, by which its use is rendered safer and more effectual. Three drachms of the pulp are usually sufficient to open the body; but to prove moderately cathartic, one or two ounces are required. It is an ingredient in *electuarium e cassia*, and *electuarium e fenâ* or lenitive electuary (A).

We are informed by Dr Wright, that preserved tamarinds are kept in most houses in Jamaica either as a sweet-meat, or for occasional use as a medicine. See PHARMACY, n° 394 and 395.

TAMARIX,

(A) "Tournefort relates, that an essential salt may be obtained from tamarinds, by dissolving the pulp in water, and setting the filtered solution, with some oil upon the surface, in a cellar for several months; that the salt is of a sourish taste, and difficultly dissoluble in water; and that a like salt is sometimes found also naturally concreted on the branches of the tree. The salt, as Beaumé observes, may be obtained more expeditiously, by clarifying the decoction of the tamarinds

TAMARIX, the TAMARISK, in botany: A genus of plants belonging to the class of *pentandria*, and order of *trigynia*; and in the natural system ranging under the 13th order, *Succulentæ*. The calyx is quinquepartite; the petals are five; the capsule is unilocular and trivalvular, and the seeds papuous. There are only two species known; the *galica* or French tamarisk, and the *germanica* or German tamarisk.

TAMBAC, in the materia medica. See **ΕΧΘΡΑΝΑ**.

TAMBOUR, in architecture, a term applied to the Corinthian and Composite capitals, as bearing some resemblance to a drum which the French call *tambour*. Some choose to call it the *rose*, and others *campana* or the bell.

TAMBOUR is also used for a little box of timber work, covered with a ceiling, within the porch of certain churches; both to prevent the view of persons passing by, and to keep off the wind, &c. by means of folding doors, &c.

TAMBOUR, also denotes a round course of stone, several whereof form the shaft of a column, not so high as a diameter.

TAMBOUR, in the arts, is a species of embroidery. The tambour is an instrument of a spherical form, upon which is stretched, by means of a string and buckle, or other suitable appendage, a piece of linen or thin silken stuff; which is wrought with a needle of a particular form, and by means of silken or gold and silver threads, into leaves, flowers, or other figures.

TAMBOURIN, is the name of a dance performed on the French stage. The air is lively, and the movements are quick.

TAMERLANE, or **TIMUR BEK**, a celebrated prince and conqueror. At the age of 25 he attained the highest dignities, with surprising courage, and an ambition astonishing to all the world. Endeavouring to perfect the great talents which he had received from nature, he spent nine years in different countries; where his great sense and elevated genius appeared in councils and assemblies, while his intrepidity and valour, whether in personal combats or pitched battles, drew upon him the admiration of all mankind. He made himself master of the three empires of Jagatay Khan, Tushi Khan, and Hülakü Khan; so that his power, riches, and magnificence, were immense. There remain vast monuments of his grandeur in the cities, towns, castles, and walls, which he built; in the rivers and canals which he dug, as well as the bridges, gardens, palaces, hospitals, mosques, and monasteries, which he erected in divers parts of Asia in so great a number, that a king might be accounted very powerful and magnificent, who should have employed 36 years only in building the great edifices which Timur caused to be founded.

Timur, according to the historian Arabsháh, was in his person very corpulent and tall. He had a large forehead and big head. His countenance was agreeable, and his complexion fair. He wore a large beard, was very strong, and well-limbed; had broad shoulders, thick fingers, and long legs. His constitution was amazingly vigorous; but he was maimed in one hand and lame of the right side. His eyes appeared full of fire; his voice was loud and piercing; he feared nothing; and when far advanced in years, his understanding was found and perfect, his body vigorous and robust, his mind constant and unshaken like a rock.

VOL. XVIII. Part I.

He did not like ratiery, and could not bear a lie. There was no joking or fooling before him; for he loved the naked truth, even although it was to his own disadvantage. He neither grieved if he miscarried in any attempt, nor appeared overjoyed on any great success. The device of his seal was, "I am sincere and plain." He had a clear and solid understanding, was surprisngly happy in his conjectures; vigilant, active, and unshaken in his resolutions. He took great delight in reading history, and was well versed in the state of countries, provinces, and cities. He was penetrating, subtle, close, and dissimbling; just by inclination, liberal from disposition; but ambition had in a great measure extinguished his humanity; war had familiarized him to blood; and his religious zeal had inspired him with the most cruel, implacable, and pernicious fanaticism.

He died on the 1st of April 1495, in the 71st year of his age and 36th of his reign. When he found death approaching, he sent for his principal officers, declared his grandson his heir, and made them swear to execute his will. Having recommended brotherly love and concord to the princes his children, he ordered one of the doctors to read the Koran at his bed's head, and often repeat the unity of God. At night he several times made profession of his belief, "That there is no other God than God," and then expired. See **MOGULS**, n^o 15, &c.

TAMTAM, a flat drum used by the Hindoos, resembling a tabor, but it is larger, and sounds louder.

TAMUS, **BLACK BRIONY**, in botany: A genus of plants belonging to the class of *diœcia*, and order of *hexandria*; and in the natural system ranging under the 11th order, *Sarmentaceæ*. The male and female flowers are both sexpartite; there is no corolla; the style is trilocular; the berry is trilocular and inferior, and contains two seeds. There are only two species known; the elephantipes, which is a native of the Cape of Good Hope, and we believe was first described by L'Heritier; and the communis.

The *communis*, or common black briony, is a native of Englan', but has not been observed growing wild in Scotland. It has a large root, which sends forth several long slender stems: the leaves are large, heart-shaped, dark green, and grow on long footstalks: the flowers are greenish, and the berry red. It flowers from May to August, and is frequent in hedges.

TAN, the bark of the oak after it has been ground and used by the tanner. The smaller sort is generally made up in little square cakes called *turf*, and sold for firing. The coarser sort is sometimes dried in the sun, and used by bakers for heating their ovens, &c. but its chief use is for making of hot-beds to raise pine-apples and other plants.—William III. introduced the use of it from Holland, for the purpose of raising orange trees; after which it was discontinued for many years: but about 1719, when *ananas* were first brought into England, it came into general use, and has ever since been in great estimation with gardeners for all the purposes of forcing, &c. on account of its strong and lasting fermentation. The smaller the tan the quicker it heats; but the larger sort acquires heat more gradually and retains it longer: the skilful gardener therefore uses the one or the other, or a mixture of both, according to the time and purpose for which it is wanted. It is some time after the tan comes out of the tanner's pit before it begins to heat, and therefore it is not fit for immediate use; but having

Q q

vig

rinds with whites of eggs, then filtering it, and evaporating it to a proper consistence, and setting it to cool: the salt shoots into crystals of a brown colour and very acid taste; but in dissolving and crystallizing them again, or barely washing them with water, they lose almost all their acidity, the acid principle of the tamarinds seeming not to be truly crystallizable." Vide *Lewis's Mat. Med.* p. 633.

Tanacetum ||
Tan-gier.
 being lain a week or two, it enters into a state of fermentation, and if put into hot-beds properly prepared, will retain a moderate heat for three or four months. When it becomes uselefs for the hot-house, it is said by Miller and others to be an excellent manure for some kinds of land.

The word *tan* is sometimes, though improperly, used for the bark itself, which is the chief ingredient in the tanning of leather. Oak bark, on account of its great astringency and gummy-resinous properties, is preferred to all other substances for the purpose of tanning, as it not only preserves the leather from rotting, but also, by condensing the pores, renders it impervious to water. See **TANNING**.

TANACETUM, **TANSY**, in botany: A genus of plants belonging to the class of *Syngenesia*, and order of *polygamia superflua*; and in the natural system ranging under the 49th order, *Compositæ*. The receptacle is naked; the pappus somewhat emarginated; the calyx imbricated and hemispherical; and the florets of the radius are trifid, and scarcely distinguishable. Gmelin has enumerated seven species; of which one only is a native of Britain, the *vulgare*.

The *vulgare*, or common tansy, grows three or four feet high; the leaves are bipinnated and serrated; the flowers yellow, and terminate the branches in flat umbels. It is found sometimes on the borders of fields and dry banks: it abounds at Wark, and Ford-castle in the neighbourhood of Kelso, on the borders of Scotland; and on the side of Gareloch on the western coast of Ross-shire: it has also been found in Breadalbane. It flowers generally in August. Of this species there is a variety with curled leaves, which is therefore called *curled tansy*. The tansy has a bitter taste, and an aromatic smell disagreeable to many people.

Uses. It is esteemed good for warming and strengthening the stomach; for which reason the young leaves have obtained a place among the culinary herbs, their juice being an ingredient in puddings, &c. It is rarely used in medicine, though extolled as a good emmenagogue. A drachm of the dried flowers has been found very beneficial in hysterical disorders arising from suppression. The seeds and leaves were formerly in considerable esteem for destroying worms in children, and are reckoned good in colics and flatulencies. In some parts of Sweden and Lapland, a bath with a decoction of this plant is made use of to assist parturition. See **PHARMACY**, n^o 193.

TANÆCIUM, in botany: A genus of the *angiosperma* order, belonging to the *didymnia* class of plants; and in the natural method ranking under the 25th order, *Putamineæ*. The calyx is monophyllous, tubulated, truncated, and entire; the corolla long, monopetalous, and white; the tube cylindrical; the limbi erect, spreading, and nearly equal; the fruit a berry covered with a thick bark, large, oblong, internally divided into two parts; in the pulp are contained a number of seeds. There are only two species of this genus; the *jaboba* and *parasticum*, both natives of Jamaica. They grow by the sides of rivers, and climb on trees and bushes.

TANAGRA, **TANAGER**, in ornithology, a genus of birds belonging to the order of *passeres*. The beak is conical, acuminate, emarginated, almost triangular at the base, and inclining a little towards the point. Dr Latham has described 44 species, all of which are of foreign extraction.

TANAIS, or **DON**. See **DON**.

TANGENT of an **ARCH**, is a right line drawn perpendicularly from the end of a diameter, passing to one extremity of the arch, and terminated by a right line drawn from the centre through the other end of that arch, and called the *secant*. See **GEOMETRY**.

TANGIER, a port-town of Africa, in the empire of

Morocco and kingdom of Fez, situated at the entrance of the Straits of Gibraltar, in W. Long. 5. 50. N. Lat. 38. 49. In 1662, this place belonged to the Portuguese, and was given to king Charles II. upon his marriage with the Infanta of Portugal: but he, growing weary of the charge of keeping it, caused it to be blown up and destroyed in 1684; ever since which time it has been only a poor fishing town. Anciently it was called *Tingis*, and gave name to the province of Mauritania Tingitana.

TANK, in the language of Indostan, a place inclosed for receiving and retaining the rain. During the periodical rains the tanks are filled, and thus in the dry season furnish water for the rice fields and cattle. Some of them are of great extent, measuring 300 or 400 feet on the side; they are of a quadrangular form, and lined with granite, descending in regular steps from the margin to the bottom.

TANNER, one who dresses hides by tanning them. See **TANNING**.

TANNER (Dr Thomas), an English prelate and celebrated antiquarian, born in 1674. He was admitted of Queen's college Oxford, where a similarity of taste for antiquities produced a close friendship between him and Edmund Gibson afterwards bishop of London. In 1697, he was chosen fellow of his college; and having already published some specimens of his skill in the antiquarian way, soon after became known to Dr Moore bishop of Norwich, who made him chancellor of his diocese. In 1722, he was made archdeacon of Norwich, and in 1731 bishop of St Asaph. He died at Oxford in 1735; and after his death was published an elaborate work, said to have employed him for 40 years, under this title, *Bibliotheca Britannica Hibernica, sive de Scriptoribus qui in Anglia, Scotia, et Hibernia, ad seculi XVII. initium floruerunt, &c.*

TANNING, the art of manufacturing leather from raw hides and skins.

Before we detail the process, it may be proper to observe, that raw hides and skins being composed of minute fibres intersecting each other in every direction, the general operation of tanning consists chiefly in expanding the pores, and dissolving a sort of greasy substance contained in them; and then, by means of the astringency and gummy-resinous properties of oak bark, to fill and reunite them, so as to give firmness and durability to the whole texture. But this theory has been controverted by some chemists, who suppose that the animal jelly contained in the skin is not dissolved, but unites during the process with the astringent principle of the bark, and forms a combination insoluble in water.

The process of tanning varies considerably, not only in different countries, but even in different parts of the same country. The following is the method most approved and practised in London and its vicinity, where the best leather is generally allowed to be manufactured.

The leather tanned in England consists chiefly of three sorts, known by the name of *butts* or *backs*, *hides*, and *skins*.

Butts are generally made from the stoutest and heaviest ox hides, and are managed as follows: After the horns are taken off, the hides are laid smooth in heaps for one or two days in the summer, and for five or six in the winter: they are then hung on poles, in a close room called a *smoke-house*, in which is kept a smouldering fire of wet tan; this occasions a small degree of putrefaction, by which means the hair is easily got off, by spreading the hide on a sort of wooden horse or beam, and scraping it with a crooked knife. The hair being taken off, the hide is thrown into a pit or pool of water to cleanse it from the dirt, &c. which being done, the hide is again spread on the wooden beam, and the grease, loose flesh, extraneous filth, &c. carefully scrubbed

ing. scrubbed out or taken off; the hides are then put into a pit of strong liquor called *ooze* or *wooze*, prepared in pits called *latches* or *taps* kept for the purpose, by infusing ground bark in water; this is termed *colouring*; after which they are removed into another pit called a *scowering*, which consists of water strongly impregnated with vitriolic acid, or with a vegetable acid prepared from rye or barley. This operation (which is called *raising*), by distending the pores of the hides, occasions them more readily to imbibe the ooze, the effect of which is to astringe and condense the fibres, and give firmness to the leather. The hides are then taken out of the scowering, and spread smooth in a pit commonly filled with water, called a *binder*, with a quantity of ground bark strewed between each. After lying a month or six weeks, they are taken up; and the decayed bark and liquor being drawn out of the pit, it is filled again with strong ooze, when they are put in as before, with bark between each hide. They now lie two or three months, at the expiration of which the same operation is repeated; they then remain four or five months, when they again undergo the same process; and after being three months in the last pit, are completely tanned, unless the hides are so remarkably stout as to want an additional pit or layer.—The whole process requires from 11 to 18 months, and sometimes two years, according to the substance of the hide, and discretion of the tanner. When taken out of the pit to be dried, they are hung on poles; and after being compressed by a steel pin, and beat out smooth by wooden hammers called *beetles*, the operation is complete; and when thoroughly dry, they are fit for sale. Butts are chiefly used for the soles of stout shoes.

The leather which goes under the denomination of *hides* is generally made from cow hides, or the lighter ox hides, which are thus managed. After the horns are taken off, and the hides washed, they are put into a pit of water saturated with lime, where they remain a few days, when they are taken out, and the hair scraped off on a wooden beam, as before described; they are then washed in a pit or pool of water, and the loose flesh, &c. being taken off, they are removed into a pit of weak ooze, where they are taken up and put down (which is technically termed *handing*) two or three times a-day for the first week: every second or third day they are shifted into a pit of fresh ooze, somewhat stronger than the former; till at the end of a month or six weeks they are put into a strong ooze, in which they are handled once or twice a-week with fresh bark for two or three months. They are then removed into another pit, called a *layer*, in which they are laid smooth, with bark ground very fine strewed between each hide. After remaining here two or three months, they are generally taken up, when the ooze is drawn out, and the hides put in again with fresh ooze and fresh bark; where, after lying two or three months more, they are completely tanned, except a few very stout hides, which may require an extra layer: they are then taken out, hung on poles, and being hammered and smoothed by a steel pin, are, when dry, fit for sale.

These hides are called *crop hides*; they are from 10 to 18 months in tanning, and are used for the soles of shoes.

Skins is the general term for the skins of calves, seals, hogs, dogs, &c. These, after being washed in water, are put into lime-pits, as before mentioned, where they are taken up and put down every third or fourth day, for a fortnight or three weeks, in order to dilate the pores and dissolve the gelatinous parts of the skin. The hair is then scraped off, and the flesh and excrescences being removed, they are put into a pit of water impregnated with pigeon-dung (called a *grainer* or *mastring*), forming a strong alkaline ley, which in a week or ten days soaking out the lime, grease, and sapo-

naceous matter (during which period they are several times scraped over with a crooked knife to work out the dirt and filth), softens the skins, and prepares them for the reception of the ooze. They are then put into a pit of weak ooze, in the same manner as the hides, and being frequently handled, are by degrees removed into a stronger and still stronger liquor, for a month or six weeks, when they are put into a very strong ooze, with fresh bark ground very fine, and at the end of two or three months, according to their substance, are sufficiently tanned; when they are taken out, hung on poles, dried, and fit for sale.

These skins are afterwards dressed and blacked by the currier; and are used for the upper-leathers of shoes, boots, &c.

The lighter sort of hides, called *dressing hides*, as well as horse-hides, are managed nearly in the same manner as skins; and are used for coach-work, harness-work, &c. &c.

As the method of tanning above described, and all others in general use, are extremely tedious and expensive in their operation, various schemes have at different times been suggested to shorten the process and lessen the expence.—Though most of these schemes have ultimately proved unsuccessful, yet it in a work of this kind it may be expected that we should not pass them over wholly unnoticed.

Some have imagined, and perhaps justly, that cold water alone is not an adequate menstruum for extracting the resinous qualities of bark, however assisted by the mucilage of the bark and of the skin; a decoction, instead of simple infusion, has therefore been recommended as a more effectual mode of obtaining those properties.

The late Dr Macbride of Dublin having been concerned in a leather manufactory, published in 1778 a new method of tanning. His projected improvements may be briefly classed under two heads: the one recommending the use of *vitriolic* instead of *vegetable* acid, brewed from rye or barley: the other substituting *lime-water*, for the purpose of extracting the virtues of the bark, instead of the *water* commonly used by tanners. With respect to the first, it is generally acknowledged that the vitriolic acid is very proper for raising or distending the pores of the hides intended for butts, as its operation is not only more simple and certain than the acid formerly used, but as it tends more effectually to render the texture of the leather firm and durable: it is therefore still preferred by the most skillful tanners. As to lime-water instead of water, it has been found inefficacious; and if the utmost care and attention be not observed, the leather is liable to suffer much injury. Even the shortening of the time and lessening of the expence (which were its chief recommendations: being very problematical, it is now almost generally exploded.

A very ingenious chemist has observed, that it is necessary, on account of a chemical combination between the astringent principle and the animal substance in the process of tanning, that free access should be given to the pure air; and therefore supposes that the process could not be conducted properly in close vessels.*

The methods of tanning in different provinces of France are so various, so complicated, and so contrary to the acknowledged principles of the manufacture, that it would be an endless and useless task to endeavour to detail them: we shall therefore content ourselves with a general reference to M. de la Lande's elaborate Treatise on this subject.

It has been said, that every part of the oak tree contains a great portion of astringent, gummy-resinous matter, and will therefore tan leather as effectually as the bark itself. This opinion, which was first published in 1674 by the Honourable Charles Howard (Phil. Trans. vol. ix.), has since been countenanced by the celebrated Buffon; who adds, that

Schaeffer's shorter process and his on the 1st, &c.

* Phil. Trans. vol. lxviii. Barbauld.

Tanning. the bark of birch will answer the purpose of tanning even sole leather, which, it is well known, requires the strongest and most penetrating materials †.

† *Mem. Acad. Sc. Paris,* 1780.

A long memoir, written by M. Gleditsch, recommends the leaves, branches, fruit, and flowers, of a vast number of plants as substitutes for oak bark. Heath dried and pulverised, call nuts, and the bark of birch, are said by M. Gesner to be used in different provinces of Germany. Abbé Nollet informs us, that the leaves of myrrh are used by the tanners in Naples. In Corsica they make use of the leaves of wild laurel dried in the sun and beaten into powder, and in the island of St Kilda they tan with the tormentil root. In some parts of Italy leather is tanned with myrtle leaves. In Russia, it is said, that leather is tanned with the bark of willow: and it may here be observed, that a late writer has recommended the extract of bark to be made in America, in order to lessen the expence of freight, &c. in conveying the bark itself to Europe.

In the year 1765, the Society of Arts, &c. granted a premium of £. 100 for the discovery of a method of tanning with oak saw-dust; which method has been adopted in Germany: and the Reverend Mr Swaine has lately revived the exploded substitute (mentioned by Gleditsch and others) of oak leaves.

The following proposal was communicated to the Path Society for extracting the essence of oak bark:

Suppose (says the author) the operator has at hand a common family brew-house, with its necessary utensils; let him procure a ton of good oak bark ground as usual for the pit; and having placed a strainer to the mash-tub, fill it two-thirds with the bark; heat as much water, nearly boiling, as will sufficiently moisten it, and mash it well together. After it has stood about two hours, draw it off clear, and put it into a cask by itself. Make a second extract with a smaller quantity of boiling water than before, so as to draw off a quantity nearly equal to the first, and put that also into the same cask with the former.

These two extracts will probably contain in them as much of the virtues of the bark as the quantity of liquid will absorb.

A third extract, rather more in quantity than the other two, may be made from the same bark, and as soon as drawn off, should be returned into the copper again when empty, and employed for the first and second mash of a quantity of fresh bark, as the three extracts may be supposed to have carried off the virtues of the first. Then proceed as before till all the bark is steeped, and a strong liquid extract is drawn from it. The bark, when taken out of the copper, may be spread in the sun to dry, and serve as fuel in the succeeding operations.

The next process is, to evaporate the watery particles from the extract by a gentle heat, till it comes to the consistence of treacle. This may be done either by the air and heat of the sun, or by the still or iron pan over the fire.

Anthony Day, Esq; of London, obtained a patent, dated 17th July 1790, for a new method of tanning, "with half the bark in half the usual time." This plan chiefly consists in concentrating the bark into a strong extract, and in some mechanical improvements in the construction of the tan-yard. But neither the one nor the other have yet been adopted.

The 12th May 1795, a patent was granted to Mr Tucker of Wickham, Hants. He proposes that the vat, made of wood, be inclosed in a metallic coating or copper pit, completely soldered, to prevent the escape of any of the fluid. This is to be surrounded with a case of brick-work, leaving an interstice of a few inches; and a fire is to be made in a grate near the bottom of the pit, to keep the ooze mode-

rately warm, and thus to shorten the process. But the great expence of these triple pits and of the fuel, it is to be feared, will counterbalance any advantages which might otherwise be derived from this invention.

Monsieur Seguin of Paris has lately submitted to the French Convention a new method of tanning, which is said to possess wonderful advantages. He has certainly exploded the ignorant and absurd systems of the French tanners, which we have above hinted at, and has shown much ingenuity and chemical knowledge in the prosecution of his discoveries; but his leading principles seem, in fact, to be nearly similar to those which have been long known and practised in England.

An ingenious manufacturer in London has, by the application of warm air, conveyed by means of flues from stoves properly constructed, and by other contrivances not generally known, considerably abridged the usual process of tanning. Some experiments have likewise been lately made with the bark of ash and of horse-chestnut.

A substitute for oak bark, the price of which has lately been enormous, is the grand desideratum in the manufacture of leather. Most of those above enumerated have hitherto been found ineffectual; but a patent, bearing date 16th January 1794, has been granted to Mr Ashton of Sheffield, Yorkshire, for his discovery of a cheap and expeditious method of tanning leather. This method chiefly consists in applying a preparation of mineral substances instead of oak bark. Those which, on account of their cheapness, are most to be preferred, are the dross of coal-pits, called sulphur-stone or pyrites, and the yellow ferruginous earth or red ochre; and, in general, all astringent, sulphureous, or vitriolated substances.

If this discovery, which is yet in its infancy, should prove successful, it may cause a material alteration in the process of this manufacture; and by reducing the expence, may ultimately be of great advantage to the public. Many other experiments are now making in England for the improvement of tanning; and as there are many persons of ingenuity and knowledge engaged in the leather manufacture, much may be expected from their industry and skill.

As the acts of Parliament respecting leather, &c. are very numerous, and many of them almost obsolete, we shall refer our readers to Burn's Justice, or to the Statutes at Large. We cannot, however, help remarking, that the act of 1 James I. cap. 22. which prescribes the mode and manner in which leather shall be tanned, the materials to be used, and the time to be employed, is so palpably absurd and oppressive, that it ought to be immediately repealed.

The revenue arising from the duty on leather tanned in Great Britain (exclusive of oiled leather) is upwards of £. 200,000 per annum.

TANTALUS, in fabulous history, king of Phrygia and Paphlagonia, was the son of Jupiter and the nymph Plota. He one day entertained the gods at his table; when, to prove their divinity, he served up his son Pelops cut in pieces. All the deities, except Ceres, perceived his cruelty and impiety, and would not touch his provisions. That goddess, whose thoughts were solely employed about her daughter Proserpine, inadvertently eat a part of his left shoulder. Pelops, however, was restored to life; and an ivory shoulder given him in the room of that which had been eaten; while Tantalus was thrown into Tartarus, where he was punished with perpetual hunger and thirst. He was chained in a lake; the water of which reached up to his chin, but retired when he attempted to drink. The branch of a tree loaded with fruit hung down even to his lips, but on his attempting to pluck the fruit the branch sprung upwards.

TANTALUS, in ornithology, a genus of birds belonging to the order of grallæ. The bill is long, subulated, and somewhat crooked; the face naked; the tongue short; and the feet have four toes palmated on the under part. There are, according to Dr Latham, 23 species; of which the most remarkable is the *ibis*, the bird so much valued by the ancient Egyptians.

The *ibis* was formerly held in great veneration in Egypt, on account of its utility in freeing the country from serpents. Serpents must therefore have been numerous, or they could not have been very offensive; and the *ibis* must have been numerous, or they could not have been useful. Yet we are assured by Mr Bruce, that the *ibis* is at present unknown in Egypt, and serpents are no nuisance; and he thinks it impossible that a country, covered with water for five months of the year as Egypt is, could ever have abounded with serpents. He endeavours, however, to reconcile the accounts of ancient historians with the state of Egypt.

In former times, when Egypt was in its flourishing state, the inhabited country extended much farther than it does at present; reaching even a considerable way into the sandy desert of Libya, where serpents have their abode. These parts were supplied with water by immense lakes, dug by the magnificent princes of those times, and filled by the annual inundation of the Nile. These frontier districts would naturally be infested with vipers from the Libyan desert, and the vast lakes would as naturally be supplied by numbers of water-fowl, of which the *ibis* is a species. This bird being likewise an enemy to serpents, the inhabitants would soon become acquainted with his use, and their superstition would soon reward him. In after ages, however, when the ancient improvements were lost, and those vast lakes dried up which brought the *ibis* thither, the serpents ceased to give any offence, because there were none of the human species there whom they could annoy; and in consequence of the want of water, the birds ceased to annoy them, retiring to their native place Ethiopia, where they continue to frequent the great stagnant pools which are common in that country.

Mr Bruce found a bird in Abyssinia, which, after comparing it with the description of the ancient writers, and the embalmed *ibis* of Egypt, he concludes is the same with the Egyptian *ibis*. It is called *atou Hannes*, signifying "father John," from its appearing annually on St John's day.

This bird is minutely described by Mr Bruce. It has a beak shaped like that of a curlew, two-thirds straight, and the remaining third crooked; the upper part of a green horny substance, and the lower part black. It measures four inches and an half from the occiput to the place where it joins the beak. The leg, from the lower joint of the thigh to the foot, is six inches; the bone round and very strong; and from the lower joint of the thigh to where it joins the body, is five inches and a half. The height of the body from the sole to the middle of the back is 19 inches; the aperture of the eye one inch; the feet and legs black: three toes before armed with sharp and straight claws; and a toe behind. The head is brown, and the plumage of the same colour down to the back, or the place where the neck and back are joined. The throat is white, as well as the back, breast, and thighs; the largest feathers of the wing are of a deep black for 13 inches from the tail; and six inches up the back from the extremity of the tail is black likewise.

TANTALUS'S Cup. See **HYDROSTATICS**, n° 44.

TANZY, or **TANSY**, in botany. See **PANACETUM**.

TAORMINA, a town in Sicily, is situated on a rock which rises to a considerable elevation above the level of the sea, and is surrounded by other rocks, the height of which

is still more considerable. It is 83 miles south of Messina, Taormina and was founded by a colony from Naxos, which were probably induced to choose the situation, not so much on account of its grandeur, as for the security which it would afford. It is also very wholesome. The road to Taormina, up the north side of the hill on which it stands, is very steep and difficult of ascent.

Of the origin of Taormina, as of other cities, almost nothing is known. A colony from the isle of Naxos settled at the foot of Etna, at no great distance from the shore, and at about a league or a league and an half from the present situation of Taormina. Dionysius the Tyrant attacked this colony, and either took or set fire to their city. The inhabitants retired to the rocks of Mount Taurus; among which they found a tract of ground sufficiently level, and of sufficient extent, for them to raise habitations upon it. It was a situation in which they might be secure from every attack. Here, therefore, they built a city; which, after the mountain, they named *Tauromenium*. It was at length raised to a very flourishing state by trade, and became celebrated as a seat of the arts. There are still many remains to be seen, which show that the fine arts must have been once successfully cultivated at Tauromenium.

Among other remains of the ancient Tauromenium, still to be seen at Taormina, there is a spacious theatre. Near the theatre is a tomb, and behind the tomb a large natural grotto. The grotto appears to have been anciently adorned within with artificial ornaments. It was possibly consecrated by the Greeks to some rural deity, perhaps to the nymphs, to whom the ancient heathens used generally to consecrate grottoes. After the inhabitants of Taormina embraced Christianity, they still continued to visit this grotto with devout veneration. Instead of the Pagan divinities to whom it had before been sacred, they substituted a saint, the venerable St Leonard, instead of the sportive nymphs. But St Leonard did not long draw crowds to this grotto; and the Christians have either defaced its Pagan decorations, or suffered them to fall into decay by the injuries of time. It is now black and smoky; and it is with difficulty that any remains of the Greek paintings with which it was once ornamented can be distinguished. Perhaps it might be sacred to Pales rather than the nymphs: She was the protectress of flocks; and the circumjacent grounds are, and always have been, excellent for pasture.

There are also to be seen in the neighbourhood of Taormina a variety of tombs, the remains of a gymnasium, with a number of other monuments which still preserve the memory of the ancient Tauromenium.

TAPE-WORM. See **TÆNIA**.

TAPER, **TAPERING**, is understood of a piece of timber, or the like, when thick at one end, and gradually diminishing to the other; as is the case in pyramids, cones, &c.

To measure TAPER-Timber, &c. See **SLIDING Rule**.

TAPER-Bored, is applied to a piece of ordnance when it is wider at the mouth than towards the breech.

TAPER, also denotes a kind of tall wax candle, placed in a candlestick, and burnt at funeral processions, and in other church solemnities.

Tapers are made of different sizes; in some places, as Italy, &c. they are cylindrical; but in most other countries, as England, France, &c. they are conical or taper; whence possibly the name; unless we rather choose to derive taper, in the adjective sense from the substantive taper, in the Saxon *tæpen* or *tæpon*, *ceruus*, "wax-candle." Both kinds are pierced at bottom for a pit in the candlestick to enter.— There are two ways of making tapers, the first with the ladle, the second by hand; for which, see **CANDLE**.

Taper,
Tapestry.

Paschal TAPER, among the Romanists, is a large taper, whereon the deacon applies five bits of frankincense, in holes made for the purpose, in form of a cross; and which he lights with new fire in the ceremony of Easter-Saturday.

The Pontifical makes Pope Zosimus the author of this usage; but Baronius will have it more ancient, and quotes a hymn of Prudentius to prove it. That pope he supposes to have only established the use thereof in parish-churches, which, till then, had been restrained to greater churches.

F. Papbroch explains the original of the paschal taper more distinctly, in his *Conatus Chronico-Historicus*, &c. It seems, though the council of Nice regulated the day whereon Easter was to be celebrated, it laid it on the patriarch of Alexandria to make a yearly canon thereof, and to send it to the pope. As all the other moveable feasts were to be regulated by that of Easter, a catalogue of them was made every year; and this was written on a taper, *ceruus*, which was blessed in the church with much solemnity.

This taper, according to the abbot Chastelain, was not a wax-candle made to be burnt; it had no wick, nor was it any thing more than a kind of column of wax, made on purpose to write the list of moveable feasts on; and which would suffice to hold that list for the space of a year.

For among the ancients, when any thing was to be written to last for ever, they engraved it on marble or steel; when it was to last a long while, they wrote it on Egyptian paper; and when it was only to last a short time, they contented themselves to write it on wax. In process of time they came to write the moveable feasts on paper, but they still fastened it to the paschal taper. Such is the original of the benediction of the paschal taper.

TAPESTRY, a kind of cloth made of wool and silk, adorned with figures of different animals, &c. and formerly used for lining the walls of rooms, churches, &c.

The art of weaving tapestry is supposed to have been borrowed from the Saracens; accordingly the workmen employed in this manufacture in France were formerly called *Sarazins* or *Sarazinois*. Guicciardini ascribes the invention of tapestry hangings to the inhabitants of the Netherlands; but he has not mentioned at what time the discovery was made. This art was brought into England by William Sheldon, near the end of Henry VIII.'s reign. In 1619 a manufacture was established at Mortlake in Surry by Sir Francis Crane, who received L. 2000 from King James to encourage the design. The first manufacture of tapestry at Paris was set up under Henry IV. in 1626 or 1607, by several artists whom that monarch invited from Flanders. Under Louis XIV. the manufacture of the Gobelins was instituted, which has introduced very beautiful cloths, remarkable for strength, for elegance of design, and a happy choice of colours. The finest paintings are copied, and eminent painters have been employed in making designs for the work.

Tapestry-work is distinguished by the workmen into two kinds, viz. that of high and that of low warp; though the difference is rather in the manner of working than in the work itself; which is in effect the same in both; only the looms, and consequently the warps, are differently situated; those of the low warp being placed flat and parallel to the horizon, and those of the high warp erected perpendicularly. The English anciently excelled all the world in the tapestry of the high warp; and they still retain their former reputation, tho' with some little change: their low warps are still admired; but as for the high ones, they are quite laid aside by the French. The French, before the Revolution, had three considerable tapestry manufactures besides that of the Gobelins; the first at Aubusson in Auvergne, the second

at Felletin in the Upper Marche, and the third at Beauvais. They were all equally established for the high and the low warp; but they had all laid aside the high warp excepting the Gobelins. There were admirable low warps likewise in Flanders, generally exceeding those of France; the chief and almost only Flemish manufactures were at Brussels, Antwerp, Oudenard, Lisle, Lournay, Bruges, and Valenciennes; but of the state of these manufactures now we are ignorant.

The usual widths of tapestry are from two ells to three ells Paris measure.

The Manufacture of Tapestry of the High Warp.—The loom on which it is wrought is placed perpendicularly: it consists of four principal pieces; two long planks or checks of wood, and two thick rollers or beams. The planks are set upright, and the beams across them, one at the top and the other at the bottom, or about a foot distance from the ground. They have each their trunnions, by which they are suspended on the planks, and are turned with bars. In each roller is a groove, from one end to the other, capable of containing a long round piece of wood, fastened therein with hooks. The use of it is to tie the ends of the warp to. The warp, which is a kind of worsted, or twisted woollen thread, is wound on the upper roller; and the woik, as fast as wove, is wound on the lower. Withinside the planks, which are seven or eight feet high, fourteen or fifteen inches broad, and three or four thick, are holes pierced from top to bottom, in which are put thick pieces of iron, with hooks at one end serving to sustain the coat-stave: these pieces of iron have also holes pierced, by putting a pin in which the stave is drawn nearer or set farther off; and thus the coats or threads are stretched or loosened at pleasure. The coat-stave is about three inches diameter, and runs all the length of the loom; on this are fixed the coats or threads, which make the threads of the warp cross each other. It has much the same effect here as the spring-stave and treddles have in the common looms. The coats are little threads fastened to each thread of the warp with a kind of sliding knot, which forms a sort of mesh or ring. They serve to keep the warp open for the passage of broaches wound with silks; woollens, or other matters used in the piece of tapestry. In the last place, there are a number of little sticks of different lengths, but all about an inch in diameter, which the workman keeps by him in baskets, to serve to make the threads of the warp cross each other, by passing them across; and, that the threads thus crossed may retain their proper situation, a packthread is run among the threads above the stick.

The loom being thus formed, and mounted with its warp, the first thing the workman does is to draw on the threads of this warp the principal lines and strokes of the design to be represented on the piece of tapestry; which is done by applying cartoons made from the painting he intends to copy to the side that is to be the wrong side of the piece, and then, with a black lead pencil, following and tracing out the contours thereof on the thread of the right side; so that the strokes appear equally both before and behind.

As for the original design the work is to be finished by, it is hung up behind the workmen, and wound on a long staff, from which a piece is unrolled from time to time as the work proceeds.

Besides the loom, &c. here described, there are three other principal instruments required for working the silk or the wool of the wool within the threads of the warp; these are a broach, a reed, and an iron needle. The broach is made of a hard wood, seven or eight inches long, and two-thirds of an inch thick, ending in a point with a little handle. This serves as a shuttle; the silks, woollens, gold, or silver, to be used in the work being wound on it. The reed

reed or comb is also of wood, eight or nine inches long, and an inch thick on the back, whence it grows less and less to the extremity of the teeth, which are more or less apart, according to the greater or less degree of fineness of the intended work. Lastly, the needle is made in form of the common needle, only bigger and longer. Its use is to press close the wool and silks when there is any line or colour that does not fit well.

All things being prepared for the work, and the workman ready to begin, he places himself on the wrong side of the piece, with his back towards the design: so that he works as it were blindfold, seeing nothing of what he does, and being obliged to quit his toil, and go to the other side of the loom whenever he would view and examine the piece, to correct it with his pressing-needle. To put silk, &c. in the warp, he first turns and looks at the design; then, taking a broach full of the proper colour, he places it among the threads of the warp, which he brings cross each other with his fingers, by means of the coats or threads fastened to the staff; this he repeats every time he is to change his colour. Having placed the silk or wool, he beats it with his reed or comb; and when he has thus wrought in several rows over each other, he goes to see the effects they have, in order to reform the contours with his needle, if there be occasion. As the work advances, it is rolled upon the lower beam, and they unroll as much warp from the upper beam as suffices them to continue the piece: the like they do of the design behind them. When the pieces are wide, several workmen may be employed at once.

We have but two things to add: the first is, that the high warp tapestry goes on much more slowly than the low warp, and takes up almost twice the time and trouble. The second is, that all the difference that the eye can perceive between the two kinds, consists in this, that in the low warp there is a red fillet, about one-twelfth of an inch broad, running on each side from top to bottom, which is wanting in the high warp.

Manufacture of Tapestry of the Low Warp.—The loom or frame, wherein the low warp is wrought, is much like that of the weavers; the principal parts thereof are two strong pieces of wood forming the sides of the loom, and bearing a beam or roller at each end: they are sustained at bottom with other strong pieces of wood in manner of trestles; and, to keep them the firmer, they are likewise fastened to the floor with a kind of buttresses, which prevent any shaking, though there are sometimes four or five workmen leaning on the fore-beam at once.

The rollers have each their trunnions, by which they are sustained: they are turned by large iron pins three feet long. Along each beam runs a groove, wherein is placed the wick, a piece of wood of about two inches diameter, and almost of the length of the roller: this piece fills the groove entirely, and is fastened therein, from space to space, by wooden pins. To the two wicks are fastened the two extremities of the warp, which is wound on the farther roller, and the work, as it advances, on the nearer.

Across the two sides, almost in the middle of the loom, passes a wooden bar, which sustains little pieces of wood, not unlike the beam of a balance: to these pieces are fastened strings, which bear certain spring-staves, wherewith the workman, by means of two treddles under the loom whereon he sets his feet, gives a motion to the coats, and makes the threads of the warp rise and fall alternately. Each loom has more or fewer of these spring-staves, and each staff more or fewer coats, as the tapestry consists of more or fewer threads.

The design or painting the tapestry-man is to follow is placed underneath the warp; where it is sustained from

space to space with strings, by means of which the design is brought nearer the warp.

The loom being mounted, there are two instruments used in working it, viz. the reed and the flute. The flute does the office of the weaver's shuttle; it is made of an hard polished wood, three or four lines thick at the ends, and somewhat more in the middle, and three or four inches long. On it are wound the silks or other matters to be used as the woof of the tapestry. The comb or reed is of wood or ivory; it has usually teeth on both sides; it is about an inch thick in the middle, but diminishes each way to the extremity of the teeth: it serves to beat the threads of the woof close to each other, as fast as the workman has passed and placed them with his flute among the threads of the warp.

The workman is seated on a bench before the loom, with his breast against the beam, only a cushion or pillow between them; and, in this posture, separating, with his fingers, the threads of the warp, that he may see the design underneath, and taking a flute, mounted with a proper colour, he passes it among the threads, after having raised or lowered them, by means of the treddles moving the spring-staves and coats.

Lastly, To press and close the threads of the silk or yarn, &c. thus placed, he strikes each course (*i. e.* what the flute leaves in its passing and coming back again) with the reed.

TAPIOCA, a species of starch, which the Brazilians make from the roots of the cassava plant, which is already described under its botanic name *JATROPHA*.

TAPIR, in zoology, a quadruped of the order of *belluz*; resembling the hippopotamus, has the fore-hoofs divided into four, and the hind-hoofs into three parts. The nose of the male extends far beyond the lower jaw, is slender, and forms a sort of proboscis; it is capable of being contracted or extended at pleasure, and its sides are sulcated. The extremities of both jaws end in a point, and there are ten cutting teeth in each. Between them and the grinders there is a vacant space; and there are ten grinders in each jaw. The ears are erect, the eyes small, and the body is shaped like that of a hog. The back is arched; the legs are short; and the hoofs small, black, and hollow. The tail is very small. The animal grows to the size of a heifer half a year old. The hair is short: when young, it is spotted with white; when old, of a dusky colour.—It inhabits the woods and rivers of the eastern side of South America, from the Isthmus of Darien to the river of Amazons. It sleeps during day in the darkest and thickest forest adjacent to the banks, and goes out in the night-time in search of food. It lives on grass, sugar-canes, and on fruits. If disturbed, it takes to the water; swims very well; or sinks below, and, like the hippopotamus, walks on the bottom as on dry ground. It makes a sort of hissing noise.—This is the largest of the American animals.

TAPPING, in general, the act of piercing a hole in a vessel, and applying a tube or canula in the aperture, for the commodious drawing off the liquor contained therein.

TAPPING, in surgery. See **SMYRNA**.

TAPROBANE, the ancient name of the island of Ceylon. See **CEYLON**.

TAR, a thick, black, unctuous substance obtained chiefly from old pines and fir-trees by burning them with a close smothering heat. It is prepared in great quantities in Norway, Sweden, Germany, Russia, and North America, and in other countries where the pine and fir abound. For the method of obtaining it, see the article **PINES**, page 765.

Becher, the celebrated chemist, first proposed to make tar from pit-coal. Manufactures for this purpose have been established many years ago in the bishopric of Liege, and

Tapestry
||
Tar.

Taranto in several parts of England. In the year 1781, the earl of Dundonald obtained a patent for extracting tar from pit-coal by a new process of distillation (see COAL, page 80.). Great hopes were entertained of the value of this discovery, but we have not heard that it has answered expectation.

Tar, which is well known for its economical uses, is properly an empyreumatic oil of turpentine, and has been much used as a medicine both internally and externally (see PHARMACY-Index.). Tar-water, or water impregnated with the more soluble parts of tar, was formerly a popular remedy. See PHARMACY, n^o 406.

TARANTO, the ancient TARENTUM, a sea port town of Italy, in the kingdom of Naples, and in the Terra de Otranto. It is a strong and populous place, with an arch-bishop's see, and the title of a principality. It is seated on a peninsula, and is defended by a strong castle; but the harbour is choked up. E. Long. 17. 29. N. Lat. 40. 35.

TARANTULA, a species of Aranea, so called from Taranto, the place where they are said to abound. See ARANEA, species 13.

TARASCON, an ancient, populous, and handsome town of France, in the department of the Mouths of the Rhone, and late province of Provence, with a well-built castle, seated on the river Rhone, opposite Beaucaire, with which it communicates by a bridge of boats. Its commerce consists in oil, brandy, starch, and stuffs that are much worn, one sort being of coarse silk, and the other of the same material and wool. It is 10 miles north of Arles, and 375 south by rail of Paris. E. Long. 4. 45. N. Lat. 43. 46.

TARAZONA, a strong town of Spain, in the kingdom of Arragon, and on the frontiers of Old Castile, with a bishop's see. It is seated partly on a rock, and partly in a fertile plain, on the river Chiles. It was taken from the Moors in 1110. W. Long. 1. 26. N. Lat. 42. 10.

TARCHONANTHUS, FLEA BANE, in botany: A genus of plants belonging to the class of *syngenesia*, and to the order of *polygamia aequalis*; and in the natural system ranging under the 49th order, *Compositæ*. The receptacle is villous, and the pappus plumy: the calyx is monophyllous, turbinate, and half divided into seven segments. There are only three species known; the *camphoratus*, *glaber*, and *ericoides*.

TARE, is an allowance for the outside package that contains such goods as cannot be unpacked without detriment; or for the papers, threads, &c. that inclose or bind any goods imported loose: or though imported in casks, chests, &c. yet cannot be unpacked and weighed neat.

TARI, or VETCH. See VICIA.

TARGET, a kind of shield or weapon of defence made use of by the ancients.

TARGIONIA, in botany; a genus of plants belonging to the class of *cryptogamia*, and natural order of *algæ*. The calyx is bivalved, including a globular body. There is only one species; the *hypophylla*, which is a native of Great Britain. The hypophylla, or vetch targionia, has leaves about a quarter of an inch long, of a heart-shape, inverted, and growing prostrate in a clump together: their upper surface is green, covered with whitish papillæ, and their lower surface is black. The fructification grows at the great end of the leaf on the lower side, and consists of two concave valves or hemispheres, of a reddish black colour, inclosing a chocolate-coloured globule, resembling the seed of a tare or vetch, full of a yellow powder. The leaves increase by shooting out young offsets from their sides like the polypus. This plant is found in the north of England, and near the Tarbet of Cantire in Scotland.

TARGUM, a name given to the Chaldee paraphrases of the books of the Old Testament. They are called *paraphrases* or *expositiones*, because they are rather comments and explications than literal translations of the text. They are written in the Chaldee tongue, which became familiar to the Jews after the time of their captivity in Babylon, and was more known to them than the Hebrew itself. So that when the Hebrew text was read in the synagogue, or in the temple, they generally added to it an explication in the Chaldee tongue for the service of the people, who had but a very imperfect knowledge of the Hebrew tongue. It is probable, that even from the time of Ezra this custom began, since this learned scribe, reading the law to the people in the temple, explained it, with the other priests that were with him, to make it understood by the people (Nehem. viii. 7-9.).

But though the custom of making these sorts of explications in the Chaldee language be very ancient among the Hebrews, yet have they no written paraphrases or targums before the era of Onkelos and Jonathan, who lived about the time of our Saviour. Jonathan is placed about 30 years before Christ, under the reign of Herod the Great. Onkelos is something more modern. The targum of Onkelos is the most of all esteemed, and copies are to be found in which it is inserted verse for verse with the Hebrew. It is so short and so simple, that it cannot be suspected of being corrupted. This paraphrast wrote only upon the books of Moses; and his style approaches nearly to the purity of the Chaldee, as it is found in Daniel and Ezra. This targum is quoted in the *miṣna*, but was not known either to Eusebius, St Jerome, or Origen.

The targum of Jonathan son of Uziel is upon the greater and lesser prophets. He is much more diffuse than Onkelos, and especially upon the lesser prophets, where he takes great liberties, and runs on in allegories. His style is pure enough, and approaches pretty near to the Chaldee of Onkelos. It is thought that the Jewish doctors who lived above 700 years after him made some additions to him.

The targum of Joseph the Blind is upon the Hagiographa. This author is much more modern, and less esteemed than those we have now mentioned. He has written upon the Psalms, Job, the Proverbs, the Canticles, Ecclesiastes, Ruth, and Esther. His style is a very corrupt Chaldee, with a great mixture of words from foreign languages.

The targum of Jerusalem is only upon the Pentateuch; nor is that entire or perfect. There are whole verses wanting, others transposed, others mutilate!; which has made many of opinion that this is only a fragment of some ancient paraphrase that is now lost. There is no targum upon Daniel, or upon the books of Ezra and Nehemiah.

These targums are of great use for the better understanding not only of the Old Testament, on which they are written, but also of the New. As to the Old Testament, they serve to vindicate the genuineness of the present Hebrew text, by proving it to be the same that was in use when these targums were made, contrary to the opinion of those who think the Jews corrupted it after our Saviour's time. They help to explain many words and phrases in the Hebrew original, and they hand down to us many of the ancient customs of the Jews. And some of them, with the phraseologies, idioms, and peculiar forms of speech, which we find in them, do in many instances help as much for the better illustration and better understanding of the New Testament as of the Old; the Jerusalem Chaldee dialect, in which they are written, being the vulgar language of the Jews in our Saviour's time. They also very much serve the Christian cause against the Jews, by interpreting many of the prophecies of the Messiah in the Old Testament in the same manner

varif manner as the Christians do. Many instances are produced to this purpose by Dr Prideaux in his *Connex. of the Hist. of the Old and New Test.* vol. iv. p. 777, &c.

These targums are published to the best advantage in the second edition of the great Hebrew Bible set forth at Basil by Buxtorf the father, anno 1610; for he has rectified the Chaldee text, and reformed the vowel pointings in it: the targums having at first been written without vowel points, which were afterwards added very erroneously by some Jews.

TARIEF, a table or catalogue containing the names of different sorts of merchandize, with the duties to be paid as settled by authority amongst trading nations.

TARPA (Spurius Meciuis), a Latin critic in the time of Julius Cæsar and Augustus. He had his tribunal in the temple of Apollo, where, with four assistants, he passed sentence on the works of the poets. Cicero and Horace make honourable mention of this critic.

TARPAULIN, a piece of canvass, well tarred over, to keep off the rain from any place. The term is also often applied in a burlesque sense to a person that has been all his life bred to the sea.

TARPEIAN, in Roman antiquity, an appellation given to a steep rock in Rome; whence, by the law of the twelve tables, those guilty of certain crimes were precipitated. It took its name from Tarpeia, a vestal virgin, who was killed by the Sabines, as related under the article ROME, n° 24.

TARQUIN the ELDER, king of Rome, succeeded Ancus Martius 615 B. C. See ROME, n° 35—40.

TARQUIN the Proud, a tyrant and usurper. See the article ROME, n° 49—51, &c.

TARRAGON, or DRAGON-WORT. See ARTEMISIA.

TARROCK, in ornithology, a species of LARUS.

TARSHISH, or TARTESSUS, a town frequently mentioned by ancient authors, the situation of which it is difficult to ascertain. See the opinions of Mr Bruce and Dr Doig on this subject under the article OPHIR.

TARTAN, in sea language, a small coasting vessel navigated in the Mediterranean sea, and having only one mast and a bowsprit, the principal sail, which is extremely large, being extended by a lateen-yard. When tartans put up a square sail, it is called a *sail of fortune*.

TARTAR, a hard solid substance which separates from wine after complete fermentation, and adheres to the top and sides of the casks. See the *Index* to CHEMISTRY and PHARMACY.

TARTARY, a very large country of Asia, situated between 57° and 160° of E. Long. reckoning from the west end of the isle of Ferro, and between 37° and 55° of Lat. It is bounded on the north by Siberia, or that part of Asia which belongs to Russia; on the west by the rivers Don, Wolga, and Kama, which separate it from Russia; on the south by the Euxine and Caspian Seas, Karazm, the two Bukharias, China, and Korea; and on the east, by the Oriental or Tartarian ocean. It extends from east to west the space of 104 degrees in longitude, or 4145 geographical miles; but its breadth is not proportionable, being not above 960 miles where broadest, and where narrowest 330.

This vast region is divided into two great parts; the one called the *Western*, the other the *Eastern Tartary*.

Western Tartary, which is much more extensive than the Eastern, containing 139 degrees of longitude out of 161, is inhabited by a great number of nations, or tribes of people, who are called *Mungls* or *Mungals*, by themselves; and *Moguls* or *Tartars*, indifferently, by other nations.

The principal mountains, or rather chains of mountains, found in this part of Great Tartary, may be divided into three classes: first, those which run along the northern borders of it; and though perhaps not always contiguous, or of the same denomination, go under the general name of *Ulug Tag*, or *Dag*, that is, the *Great Mountain*. Secondly, those which make the southern bounds, and are called *Kichug Tag*, or the *Lesser Mountain*. The third great chain is called *Mount Altay*, lying nearly in the middle, between the Caspian Sea and Eastern Tartary, and extending between the other two, in about the 110th degree of longitude.

The principal rivers of Western Tartary, besides the Dnieper, Don, and Wolga, are the Jaik or Yaik, and Yem, both descending from the Ulug Tag, and falling into the Caspian Sea on the north side: the river Ili or Khonghis, which rises out of the Kichug Tag, on the borders of Little Bukharia, and runs north-west into the lake Palkash, which is about forty miles long, and 30 broad, in latitude 48°, longitude 97°, reckoning from the isle of Ferro: on this river the khan of the Eluths or Kalmucks usually resides: the river Irtish, Irtis, or Erchis, which rises in Mount Altay, and runs westward, inclining to the north, between two branches of it, into the lake Sayfan, Saffan, or Ifan, called also *Honhotu-Nor*, 90 miles long from west to east, and 40 broad, in latitude 47° 30', longitude 104°; from whence issuing again, it passes north-west, through part of Siberia, and falls into the Oby, which has its source in the same mountain, about one degree to the north of that of the Irtish; and seven or eight degrees to the north-east rises the Kem or Jenisea, which runs westward for the space of seven or eight degrees, and then turning northward enters Siberia. The next river of note is the Selinga, which rises out of the lake Kosogol, Hutuktu or Khutuktu, which is 70 miles long from south to north, and 20 broad, in latitude 52°, longitude 118°, not far from the source of the Jenisea, and taking a sweep southward, round by the east, falls northward into the lake Baykal in Siberia, about 30 leagues north-west of the city Selinghinskoy, which stands upon it. Into the Selinga runs the Orkon, coming from the south-west; and into the Orkon the Tula, rising eastward in Mount Kentey. On the same mountain rises also two other rivers, viz. the Onon, called also by the Tartars *Saghalian Ula*, or the Dragon river, and by the Russians *Amur*; which running north-eastward, and then taking a large sweep by the south, rolls along the bounds of Eastern Tartary, and falls into the Eastern Ocean. On its banks stand two cities; Nerchinskoy or Nipchew, a frontier of the Russians, almost due north of Pekin in China; and Saghalian Ula, possessed by the Chinese. Another large river is the Kerlon or Kerulon, which running north-eastward, falls into the lake Kulon or Dalay, which is 60 miles long from south-west to north-east, and 27 broad, in latitude 45° 30', longitude 135°, and issuing out again under the name of *Ergona* or *Argun*, joins the Saghalian Ula, about 170 miles beyond Nerchinskoy. To these let us add the river Kalka, from whence, though small, the Kalka-Moguls or Mongols take their name. It rises in the mountains, separating Eastern from Western Tartary, and, running eastward, falls into the lake Puir, and then into that of Kulon, before spoken of.

In the middle of a desert, on the banks of the river Irtish, is a remarkable piece of antiquity called *SEDMY PALATY*, or the *seven palaces*.

Above the Sedmy Palaty, towards the source of the Irtish, grows the best rhubarb in the world, without the least culture. In the plain of this country also, about eight or ten days journey from Tomskoy in Siberia, are found many

Tartary. tombs and burying-places of ancient heroes, who in all probability fell in battle. These tombs are easily distinguished by the mounds of earth and stone raised over them. The Tartars say, Tamerlane had many engagements in this country with the Kalmucks, whom he in vain endeavoured to conquer. Many persons go from Tomsky, and other parts, every summer, to these graves, which they dig up, and find among the ashes of the dead considerable quantities of gold, silver, brass, and some precious stones, but particularly hilts of swords and armour. They find also ornaments of saddles and bridles, and other trappings for horses; and sometimes those of elephants. Whence it appears, that when any general or person of distinction was interred, all his arms, his favourite horse and servant, were buried with him in the same grave; this custom prevails to this day among the Kalmucks and other Tartars, and seems to be of great antiquity. It appears from the number of graves, that many thousands must have fallen in those places; for the people have continued to dig for treasure many years, and still find it unexhausted. They are, indeed, sometimes interrupted, and robbed of all their booty, by parties of Kalmucks, who abhor disturbing the ashes of the dead. Armed men on horseback, cast in brass, of no mean design and workmanship, with the figures of deer cast in pure gold, have been dug out of these tombs. They once discovered an arched vault, where they found the remains of a man, with his bow, lance, and other arms, lying on a silver table. On touching the body, it fell to dust. The value of the table and arms was very considerable. For the manners and customs of these Tartars, see KALMUCKS.

Great quantities of a kind of ivory, called by the natives *Mammons-horn*, are found in this country and in Siberia, on the banks of the Obi. They are commonly found on the banks of rivers that have been washed by floods. Some of them are very entire and fresh, like the best ivory in all respects, excepting only the colour, which is of a yellowish hue. In Siberia they make snuff-boxes, combs, and divers sorts of turnery ware of them. Some have been found weighing above 100 pounds English.

The most considerable tribes in Western Tartary, next to the Kalmucks, are the Kalkas and Mungls, or Mongals, properly so called. The country of the Kalkas extends eastward, from mount Altay to the source of the river Kalka, whence they derive their name, in the borders of Eastern Tartary, and 139th degree of longitude. The territories of the Mungls, or Mongalia, lie to the south of those of the Kalkas, between them and the great wall of China, to which empire both nations are subject. Besides these tribes, who are idolaters of the religion of the Delay Lama, there are others, who possess that part of Western Tartary called *Turkestan*, the original country of the Turks and Turkmans, situated to the north of Great Bukharia and Karazm, between those countries and the dominions of the Eluths. Under Western Tartary also is comprehended Tibet, Thiber, or Tobbut, subject to the Delay Lama, or great high-priest of the Pagan Tartars and Chinese.

In all the vast region of Western Tartary, there are but few towns, most of the inhabitants living under tents, especially in summer, and moving from place to place with their flocks and herds. They generally encamp near some river for the convenience of water.

The air of this country is temperate, wholesome, and pleasant, being equally removed from the extremes of heat and cold. As to the soil, though there are many mountains, lakes, and deserts in it, yet the banks of the rivers, and the plains, some of which are of great extent, are exceeding fertile. The mountains, woods, and deserts, abound with venison, game, and wild fowl; and the rivers and lakes both

with fish and fowl. In particular, here are wild mules, horses, and dromedaries, wild boars, several kinds of deer, a species of goats with yellow hair, squirrels, foxes; an animal called *bauteban*, resembling an elk; another called *chulon* or *chelifon*, that seems to be a sort of lynx; and a creature called *tack-pe*, as small as an ermine, of whose skins the Chinese make mantles to keep out the cold. Among other birds of extraordinary beauty, bred in this country, there is one called the *shonkar*, which is all over white except the beak, wings, and tail, which are of a very fine red. Notwithstanding the soil in many parts of Tartary is so luxuriant, yet we are told it does not produce a single wood of tall trees of any kind whatever, excepting in some few places towards the frontiers; all the wood that is found in the heart of the country consisting of shrubs, which never exceed the height of a pike, and even these are rare.

It is remarkable, that in all the vast dominions of Mongalia, there is not so much as a single house to be seen. All the people, even the prince and high-priest, live constantly in tents, and remove their cattle from place to place as convenience requires. These people do not trouble themselves with ploughing or digging the ground in any fashion, but are content with the produce of their flocks, though the soil is exceeding fine, and capable, by proper culture, of producing grain of several sorts.

In the country of the Mongals the grass is very thick and rank, and would with little labour make excellent hay. This grass is often set on fire by the Mongals in the spring during high winds. At such times it burns most furiously, running like wild-fire, and spreading its flames to the distance of perhaps to or 20 miles, till its progress is interrupted by some river or barren hill. The rapidity of those flames, their smoke and crackling noise, cannot easily be conceived by those who have not seen them. When any person finds himself to the leeward of them, the only method by which he can save himself from their fury, is to kindle immediately the grass where he stands, and follow his own fire. For this purpose, every person is provided with flints, steel, and tinder. The reason why the Mongals set fire to the grass, is to procure early pasture to their cattle. The ashes left upon the ground sink into the earth at the melting of the snow, and prove an excellent manure; so that the grass in the spring rises on the lands which have been prepared in this manner as thick as a field of wheat. Caravans, travellers with merchandise, but especially armies, never encamp upon this rank grass; and there are several instances of considerable bodies of men being put in confusion, and even defeated, by the enemy's setting fire to the grass.

Eastern Tartary, according to the limits usually assigned it by historians and geographers, is bounded to the west by Western Tartary, or by that part possessed by the proper Mungls and Kalkas; on the north by Siberia; on the east by that part of the Oriental Ocean called the *Tartarian-Sea*; and on the south by the same sea, the kingdom of Korea, and the Yellow Sea, which separates it from China. It is situated between the 137th and 160th degrees of longitude, being about 900 miles long from south to north, and near as many in breadth from west to east, yet but thinly peopled. This large region is at present divided into three great governments, all subject to the Chinese, viz. Shing-yang or Murden, Kurin-ula, and Tifitsikar.

The government of Shin-yang, containing all the ancient Lyau tong or Quan-tong, is bounded on the south by the great wall of China and the Yellow Sea; on the east, north, and west, it is inclosed by a wooden palisade, seven or eight feet high, fitter to mark its bounds and keep out petty robbers than to oppose an army.

The lands of this province are for the general very fertile, producing abundance of wheat, millet, roots, and cotton. They also afford pasture to great numbers of sheep and oxen, which are rarely seen in any of the provinces of China. They have indeed but little rice; yet, to make amends, there is plenty of apples, pears, hazel-nuts, filberds, and chesnuts, even in the forests. The eastern part, which borders on the ancient country of the Manchews and kingdom of Korea, is full of deserts and bogs. The principal cities of this government are Shing-yang or Mugden, Fong-whang ching, Inden, Ichew, and Kingchew. This country was the original seat of the Tartar tribe of the Manchews, who have been masters of China above 100 years.

The government of Kirin-ula-hotun is bounded westward by the palisade of Lyau-tong; on the east, by the Eastern Ocean; southward, by the kingdom of Korea; and on the north by the great river Saghalian; so that it extends no fewer than 12 degrees, and almost 20 degrees in longitude, being 750 miles in length and 600 in breadth.

This vast country abounds in millet and oats, with a sort of grain unknown in Europe, called by the Chinese *may-sen-mi*, as being of a middle kind between wheat and rice. It is wholesome, and much used in those cold regions. There is but little wheat or rice here; but whether that is the fault of the soil or the inhabitants, we cannot assert. The cold begins much sooner in these parts than at Paris, whose latitude is near 50 degrees. The forests, which are very thick and large the nearer you advance to the Eastern Ocean, contribute not a little to bring it on and keep it up. The banks of the rivers here, in summer, are enamelled with a variety of flowers common in Europe, excepting the yellow lilies, which are of a most lively colour, in height and shape exactly resembling our white lilies, but are of a much weaker scent. But the plant which is most esteemed, and draws a great number of herbalists into these deserts, is the gin-seng*, called by the Manchews *arhota*, that is, the chief or queen of plants. It is highly valued for its virtues in curing several diseases, and all decays of strength proceeding from excessive labour of body or mind. For this reason it has always been the principal riches of Eastern Tartary; what is found in the north of Korea being consumed in that kingdom.

Formerly the Chinese used to get into the gin-seng country among the mandarins and soldiers continually passing; but in 1700 the emperor Kang-hi, that his Manchews might reap this advantage, ordered 10,000 of his soldiers, encamped without the great wall, to go and gather it, on condition that each should give him two ounces of the best, and take an equal weight of fine silver for the remainder: by which means the emperor got in that year 20,000 pounds of it for less than one-fourth of the price it bears at Peking. The root is the only part that is used medicinally. Its value is enhanced by its age, for the largest and firmest are the best. This country abounds also in fine fables, grey ermines, and black foxes.

One of the tribes of Tartars inhabiting this country are called the *Yu-pi Tartars*, whose manner of life is somewhat extraordinary. All the summer they spend in fishing: one part of what they catch is laid up to make oil for their lamps; another serves for their daily food; and the rest, which they dry in the sun, without salting, for they have no salt, is laid up for their winter's provisions, whereof both men and cattle eat when the rivers are frozen. Notwithstanding this diet, a great deal of strength and vigour appears in most of these poor people. Their raiment consists of the skins of fish, which, after dressing and dyeing of three or four colours, they shape and sew in to delicate a manner, that one would imagine they made use of silk, till,

on ripping a stitch or two, you perceive an exceeding fine thong, cut out of a very thin skin. When the rivers are frozen, their sledges are drawn by dogs trained up for the purpose, and highly valued.

Although the Manchew language is as much used at the court of Peking as the Chinese, and all public acts are drawn up in the one as well as the other; yet it began to decline, and would probably have been lost, had not the Tartars taken great pains to preserve it, by translating Chinese books, and compiling dictionaries, under the emperor's patronage. Their language is singular in this respect, that the verb differs as often as the substantive governed by it; or, which is the same thing, to every different substantive they use a different verb; as for instance, when they would say, *make a verse, a picture, a statue*; for though the repetition of the same verb in discourse might be excusable, it is with them unpardonable in writing, as making a monstrous grating to their ears.

Another singularity of their language is the copiousness of it; for instance, besides names for each species of animals, they have words to express their several ages and qualities. *Judigon* is the general name for a dog; but *tayba* signifies a dog who has very long and thick hair both on his ears and tail; and *yolo*, a dog with a long thick muzzle and tail, large ears, and hanging lips. The horse, as more serviceable to them, has 20 times more names than the dog; almost every motion of him giving occasion to a different name. Where they could get that astonishing multitude of names and terms, is not easy to determine.

This country is but thinly peopled, and contains only four cities, namely, Kirinula-hotun or Khotun, Pedne or Petuna, Ninguta, and Putay-ula-hotun, which are very ill-built, and encompassed with no better than mud walls. The first stands on the river Songari, and is the residence of the Manchew general, who has all the privileges of a viceroy, and commands the mandarines as well as the troops. Ninguta, which the family now reigning in China considers as its ancient patrimony, is situated on the Hurkapira, which runs northward into the Songari. Its name is compounded of two Tartarian words which signify seven chiefs, to express the rise of the Manchew kingdom, which was first established by seven brothers of the late emperor Kanghi's great-grandfather's father.

The tribe of the Manchews, who inhabit a part of Eastern Tartary, and are lords of all the other inhabitants thereof, are called by the Russians *Bogdoy*, and the emperor of China *Bogdoy Khan* and *Amulon Bogdoy Khan*.

The third government into which Eastern Tartary is divided, is that of Tiflikar. It is 740 miles long and 600 broad; and belongs partly to China and partly to Russia. The people are great hunters, dexterous archers, and pay their tribute in sable-skins; each family being assessed two or three, or more a-year, according to the number of able persons.

This province is inhabited chiefly by three sorts of Tartars, the Manchews, the Solons, and Taguri, of whom the first are masters. The Taguri are a large robust people, but not very numerous. They live in houtes or huts, and cultivate barley, oats, and millet. Their cattle are principally horses, dromedaries, oxen, cows, and sheep. They make much use of their oxen to ride on.

The Solons also are a brave robust people. Their dress is a short jacket of wolves skins, with a cap of the same; and they have long cloaks made of fox or tigers skins, to defend them against the cold, especially of the night. They hang their bows at their backs. Their women ride on horseback, drive the plough, hunt stags and other game.

Besides the country towns or villages, there are three ci-

Tartary.

ties in the province of Ttstikar, namely, Ttstikar, Merghen, and Saghalian-ûla-hotun. The garrison of Ttstikar, the capital, consists of Manchews; but the inhabitants are mostly Chinese. According to their own account, they are all shamams, or conjurers, and invoke the devil with frightful cries. They give their dead two burials, first leaving a hole at top of the grave, where the relations daily bring victuals, which they convey to the mouth of the deceased with a spoon, and leave drink in small tin cups standing round the grave. This ceremony holds for several weeks, after which they bury the body deeper in the ground.

Several rivers in this country produce pearls, which, though much cried up by the Tartars, would be little valued by Europeans, on account of their defects in shape and colour.

The kingdoms or countries of Corea, Lyau-tong, and Nyu-che, forming a part of Katay, Kitay, or Cathay, and by some included under Eastern Tartary, are more properly provinces of China, though they lie without the great wall.

Usbeck TARTARY. To the north and north-east of Persia lie the countries of Karasm, and Great and Little Bukharia, which being mostly subject to and inhabited by the tribe of Usbeck Tartars, are commonly known by the general name of *Usbeck Tartary*.

The kingdom of Karasm was known to the ancient Greeks, as appears from Herodotus, Ptolemy, and other authors of that nation, by the name of *Khorasina*. At present it is bounded on the north by the country of Turkestan, and the dominions of the great khan of the Eluths or Kalmucks; on the east, by Great Bukharia, from which it is separated partly by the mountains of Irdar, and partly by the deserts of Karak and Gaznah; on the south, by the provinces of Astarabad and Khorassan, belonging to Iran or Persia at large, from which it is divided by the river Jihun or Amu, and sundry deserts of a vast extent; and on the west by the Caspian Sea.

It may be about 440 miles in length from south to north, and 300 from west to east; being situated between the 39th and 46th degrees of north latitude, and the 71st and 77th degrees of east longitude. The country consists, for the most part, of vast sandy plains, some of which are barren deserts, but others afford excellent pasture. There is good land in several of the provinces, where vines grow, and wine is made; but water being scarce, a great part of the country turns to no account.

Karasm owes all its fertility to three rivers and a lake. The rivers are the Amu, Khefil, and Sir. The Amu, as it is called by the Usbecks and Persians, is the Jihun of the Arabs, and Oxus of the ancient Greeks. It has its source in those high mountains which separate Little Bukharia from the dominions of the Great Mogul; and, after passing through Great Bukharia and Karasm, divides into two branches, one of which falls into the Khefil, and the other into the Caspian Sea, towards the borders of the province of Astarabad. The Amu abounds with all sorts of excellent fish, and its banks are the most charming in the world. Along them grows those excellent melons and other fruits so much esteemed in Persia, the Indies, and Russia.

The river Khefil rises in the mountains to the north-east of the province of Samarkant, and falls into the lake of Aral or Eagles, 50 or 60 miles below its junction with a branch of the Amu. Its banks are exceeding fertile wherever they are cultivated.

The Sir or Daria rises in the mountains to the east of Little Bukharia, and after a long course westward, along the borders of the Bukharias and Karasm, falls at last into the lake Aral.

Karasm is at present inhabited by three sorts of people, the Sarts, Turkmans, and Usbeck Tartars. With regard to the first of these, we are told, that they are the ancient inhabitants of the country, or those who were settled there before the Usbecks became masters of it; and that they support themselves like the Turkmans by their cattle and husbandry. The Turkmans or Turkomans came originally from Turkestan or the parts of Tartary to the north of Karasm and Great Bukharia, towards the 11th century. They divided into two parties; one of which went round the north side of the Caspian Sea, and settled in the western parts of the Greater Armenia, from thence called *Turkomania*, or *the country of the Turkomans*. The second party turned south, and rested about the banks of the river Amu and the shores of the Caspian Sea, where they still possess a great many towns and villages, in the countries of Karasm and Astarabad.

The name of *Usbecks*, which the ruling tribe of the Tartars of Karasm and Great Bukharia bear at present, is derived from one of their khans. The Usbecks of Karasm are divided into several hords, and live for the most part by rapine; resembling in all respects those of Great Bukharia, excepting that they are much more rude and uncivilized. Like the Turkmans, they dwell in winter in the towns and villages which are towards the middle of Karasm; and in summer the greater part of them encamp in the neighbourhood of the Amu, or in other places where they can meet with pasture for their cattle; always watching for some convenient opportunity to rob and plunder. They never cease making incursions upon the adjacent territories of Persia or Great Bukharia, and are to be restrained by no treaties or engagements whatsoever. Although they have fixed habitations, yet, in travelling from one place to another, they carry with them all their effects of value, conformable to the way of living in use among their ancestors before they had settled dwellings.

These Tartars, it is said, never ride without their bows, arrows, and swords, although it be in hawking or taking any other diversion. They have no arts or sciences among them, neither do they till or sow. They are great devourers of flesh, which they cut in small pieces, and eat greedily by handfuls, especially horse flesh.

Their chief drink is sour mare's milk, like that in use with the Nogays. They eat their victuals upon the ground, sitting with their legs double under them, which is their posture also when they pray.

All these tribes have abundance of camels, horses, and sheep, both wild and tame. Their sheep are extraordinary large, with great tails weighing 60 or 80 pounds. There are many wild horses in the country, which the Tartars frequently kill with their hawks. These birds are taught to seize upon the head or neck of the beast; which being tired with toiling to get rid of this cruel enemy, the hunter, who follows his game, comes up and kills him. Some travellers tell us, that the inhabitants of this country have not the use of gold, silver, or any other coin, but barter their cattle for necessaries. Others tell us, that they have money, particularly a piece of silver called *tanga*, the value near the fourth part of a crown. It is round, and has on one side the name of the country, and on the other that of the khan, with the year of the hejira. There are also, it is said, small pieces of copper, of different sizes, which answer to our pence, half-pence, and farthings.

As to the government of Karasm, the Usbecks being masters, it is commonly vested in divers princes of that tribe of the same house; of whom, notwithstanding, only one has the title of *khan*, with a kind of superiority over the others.

This

This khan has no sort of dependence on him of Great Bukharia, or any other prince.

Bukharia, Bokharia, Bokaria, Bogaria, or Boharia, is the name given to all that region or tract of land lying between Karahm and the Great Kobi, or Sandy Desert, bordering on China. It is divided into the Great and Little Bukharia. For an account of which, see the article BUKHARIA.

The inhabitants of these different countries, which are known by the name of *Tartary*, have a tradition among themselves that they are all sprung from one common stock, and that they are of the most remote antiquity. To this tradition much credit is due; for they are known to be the descendants of the ancient Scythians. But when M. Bailly contends that the Tartars are the most ancient of nations, and the civilizers of mankind, he writes without authority, and advances a paradox at which every mind must recoil. Among the Tartars there are no historical monuments of antiquity and credit; for all their writings extant, even those in the Mogul dialect, are long subsequent to the time of Mohammed; nor is it possible, says Sir William Jones, to distinguish their traditions from those of the Arabs, whose religious opinions they have in general adopted. M. Bailly displays indeed great learning and ingenuity in his attempt to derive civilization from this source; but the greatest learning and acuteness, together with the charms of a most engaging style, can hardly render tolerable a system, which places an earthly paradise, the gardens of *Hesperus*, the islands of the *Maccarees*, the groves of Elysium, if not of Eden, the heaven of INDRA, the Peristan or fairy land of the Persian poets, with its city of diamonds and its country of *Shadcam*, so named from Pleasure and Love, not in any climate which the common sense of mankind considers as the seat of delights, but beyond the mouth of the Oby, in the Frozen Sea, in a region equalled only by that where the wild imagination of Dante led him to fix the worst of criminals in a state of punishment after death, and of which he could not, he says, even think without shivering.

Before the era of Mohammed the Tartars had no literature. The magnificent Chengiz, whose empire included an area of near 80 square degrees, could find none of his own Mongals, as the best authors inform us, able to write his dispatches; and TIMUR or TAMERLANE, a savage of strong natural parts, and passionately fond of hearing histories read to him, could himself neither write nor read. It is true, that by some Arabian writers mention is made of a set of Tartarian characters, said to consist of 41 letters; but from the description of these characters, Sir William Jones, with much plausibility, suspects them to have been those of Tibet.

“From ancient monuments therefore (continues the learned president) we have no proof that the Tartars were themselves well instructed, much less that they instructed the world; nor have we any stronger reason to conclude from their general manners and character, that they had made an early proficiency in arts and sciences; even of poetry, the most universal and most natural of the fine arts, we find no genuine specimens ascribed to them, except some horrible war-songs expressed in Persian by Ali or Yezd, and possibly invented by him. After the conquest of Persia by the Mongals, their princes indeed encouraged learning, and even made astronomical observations at Samarkand; as the Turks became polished by mixing with the Persians and Arabs, though *their very nature*, as one of their own writers confesses, *had before been like an incurable distemper, and their minds clouded with ignorance*: thus also the Manchu monarchs of China have been patrons of the learned and ingenious, and the emperor Tien-Long is, if he be now living, a fine Chinese poet. In all these instances the Tartars have resembled the Romans, who, before they had subdued

Greece, were little better than tigers in war, and Fauns or Sylvans in science and art.

“We may readily believe those who assure us, that some tribes of wandering Tartars had real skill in applying herbs and minerals to the purposes of medicine, and pretended to skill in magic: but the general character of their nation seems to have been this; they were professed hunters or fiers, dwelling, on that account, in forests or near great rivers, under huts or rude tents, or in waggons drawn by their cattle from station to station; they were dexterous archers, excellent horsemen, bold combatants, appearing often to flee in disorder for the sake of renewing their attack with advantage; drinking the milk of mares, and eating the flesh of colts; and thus in many respects resembling the old Arabs, but in nothing more than in their love of intoxicating liquors, and in nothing less than in a taste for poetry and the improvement of their language.”

Krim TARTARY. See CRIMEA.

TASSEL, a sort of pendant ornament at the corners of a cushion or the like. In building, tassels denote those pieces of board that lie under the ends of the mantlet trees.

TASSO (Torquato), a justly celebrated Italian poet, was born at Sorrento in the kingdom of Naples, in 1544. He was the son of Bernardo Tasso, the author of several ingenious compositions both in verse and prose; and of Portia de Roffi, a lady of an illustrious family of Naples.

His father being obliged to accompany the prince of Salerno to the emperor Charles V. upon a deputation from Naples to remonstrate against erecting the inquisition there, committed the care of his son, then three years old, to Angeluzza, a man of great learning; who, we are told, at this tender age began to teach him grammar: at four he was sent to the Jesuit's college, and at seven was well acquainted with Latin and Greek. At 12 years of age he went from Rome to Mantua, where his father had entered into the service of the duke Guglielmo Gonzago: he had then completed his knowledge of the Latin and Greek languages; he was well acquainted with rhetoric and poetry, and a master of Aristotle's ethics; he had also studied the precepts of Maurizio Cataneo with particular attention, and ever after revered him as a second father.

He was soon after sent to the university of Padua; and, in his 18th year, published his *Rinaldo*, a poem written upon the plan of Homer's *Odyssey*. This extended his reputation throughout all Italy; but greatly displeased his father, who foresaw that it would seduce him from studies of more advantage. He went to Padua, to remonstrate against his apparent purpose of giving himself up to philosophy and poetry, and made use of many very harsh expressions, which Tasso heard with a patience and tranquillity that made the old gentleman still more angry: “Of what use is that philosophy on which you value yourself so much?” “It has enabled me (replied Tasso) to endure the harshness of your reproofs.”

He soon after went to Bologna, by the invitation of the city and college; but in a little time returned to Padua at the pressing instances of Scipio Gonzago, who had been elected prince of the academy that had been established in that city by the name of the *Ætherei*. He was incorporated into this society, and took upon himself the name of *Pentilo*.

In this retreat he formed the design of his *Jerusalem Delivered*, invented the fable, disposed the parts, and determined to dedicate it to the house of Este; but whether to Alphonso II. the last duke of Ferrara, or his brother the cardinal Luigi, to whom he had already dedicated his *Rinaldo*, he was yet in doubt. Being pressed by both the brothers to reside with them at Ferrara, he consented. The duke

Tasso.

Tasso. duke gave him an apartment in his palace, where he lived in peace and affluence, and prosecuted his work; which he now determined to dedicate to the duke, and which was published by his patrons, book by book, as he finished them.

When he was about 27, he published a pastoral comedy called *Aminta*; which was received with universal applause, as a masterpiece in its kind, and is the original of the *Pastor Fido* and *Filli di Sciro*.

In the 30th year of his age he finished his *Jerusalem*, and the whole was reprinted and published together: the success of it was astonishing; it was translated into Latin, French, Spanish, and even the Oriental languages, almost as soon as it appeared.

But it was Tasso's fate to become wretched from the moment that he gained the summit of reputation: very soon after his *Jerusalem* was published, he lost his father, who died at Ostia upon the Po, the government of which place had been given him by the duke of Mantua; his *Jerusalem* was attacked by a swarm of ignorant but petulant critics, who gave the preference to the rhapsodies of Pulci and Boyardo; and the perfidy of a friend drew upon him much greater misfortunes.

This friend was a gentleman of Ferrara, to whom Tasso had indiscreetly communicated some transactions of a very delicate nature concerning his patron the duke, with whom he lived. This secret being betrayed, Tasso reproached his friend for his treachery; and this reproach was retorted in such a manner as provoked Tasso to strike him. A challenge immediately ensued, and the opponents met and engaged; but during the rencounter, three brothers of Tasso's antagonist came up, and all fell upon him together: Tasso defended himself so well, that he wounded two of them, and kept his ground against the others till some people came up and parted them. This made a great noise at Ferrara, where nothing was talked of but the valour of Tasso; and it became a kind of proverb, "That Tasso, with his pen and his sword, was superior to all men."

The duke being informed of the quarrel, banished the brothers from his dominions, confiscated their estates, and Tasso himself he shut up in prison, under pretence of securing him from any future attacks of his enemies.

Tasso found means to escape from this confinement, after having suffered it about a year; and, being now about 34 years of age, retired to Turin, where he was soon known and recommended to the duke of Savoy, who showed him many marks of esteem and affection: but Tasso, fearing that the duke of Ferrara would require him to be delivered up, and that the duke of Savoy would choose rather to comply than forfeit the friendship of that prince, precipitately set out for Rome alone, and without proper necessaries for such a journey.

He got safe, however, to Rome; where he went directly to his friend Mauritio Cataneo, who received him with great kindness, and the whole city seemed to rejoice at the presence of so extraordinary a person. He was visited by princes, cardinals, prelates, and all the learned in general. But being impatient of exile, he took measures to make his peace with the duke, and succeeded.

The duke received him with great appearance of satisfaction, and gave him fresh marks of his esteem. But Tasso having made some attempts on the princess Leonora, whom he has celebrated in several of his verses, the duke her brother, believing, or pretending to believe, that his ill conduct proceeded from a disordered understanding, caused him to be strictly confined in the hospital of St Anne. Tasso applied to the duke, by every friend he had, to release him from this confinement; but the duke coldly answered, that

instead of endeavouring to procure the enlargement of a person in his condition, they ought rather to exhort him to submit patiently to such remedies as were judged proper for him. Tasso was certainly disordered in his mind, whether as the effect or cause of this confinement: he was conscious that he laboured under some distemper, and he believed the cause of it to be supernatural, and fancied himself haunted by a spirit that continually disordered his books and papers; to which, however, the tricks played him by his keepers might contribute. He continued, notwithstanding, to solicit the interposition of all the powers in Italy, to whom he could find means to apply, particularly the emperor and the pope; but without success. At last, after he had been a prisoner seven years, Vincentio Gonzaga prince of Mantua came to Ferrara among other great personages, during the festivals and rejoicings that were held there on the marriage of Caesar of Este with Virginia of Medicis, procured his liberty, and took him with him to Mantua, he being then in the 42d year of his age.

At Mantua he lived about a year in great favour with the prince, and in all the splendour and affluence which the favour of great princes confers: but he was weary of a state of dependence, however splendid and luxurious; and therefore resolved to go to Naples, and endeavour to recover his mother's jointure, which had been seized by her relations when he went into exile with his father Bernardo. With this view he procured letters of recommendation to the viceroy; and having taken leave of the prince of Mantua, he went first to Bergamo, where he staid some time, and from thence proceeded to Naples.

At Naples he immediately commenced a suit at law for the recovery of his right, and divided his time between a prosecution of that and his studies. But during the summer he retired to Bisaccio with one Giovanni Batista Manso, with whom he had contracted an intimate friendship.

Tasso, who was now in his 45th year, appeared to Manso, while they were at Bisaccio, to be affected with a melancholy, which had very singular effects; he therefore very frequently questioned him about them; and Tasso told him that he had a familiar spirit, with whom he frequently and freely conversed. Manso treated this as an illusion, but Tasso still affirmed it to be real; and telling him that the spirit would meet and converse with him the next day, invited him to be present. Manso coming at the hour appointed, saw Tasso fix his eyes with great earnestness upon a window, and perceiving him to continue without motion, he called him several times by his name. Tasso made no reply; but at length cried out with great vehemence, "There is the friendly spirit that is come to converse with me; look, and be convinced that what I have said is true." Manso looked, not without some surprize, but saw nothing except the sun beams which shone through the window. He was just going to ask where the pretended spirit was, when he was prevented by Tasso's speaking with great earnestness to some imaginary being, sometimes putting questions, and sometimes giving answers, in a manner so pleasing, and with such elevation of expression, that Manso had no desire to interrupt him: the conversation at last ended by the supposed departure of the spirit; when Tasso turning round to his friend, asked if his doubts were removed? To which he made no reply, being so much amazed that he gladly waved all farther conversation on the subject.

Finding his law-suit not likely to be soon determine^d, he went from Naples to Rome, where he continued about a year in high favour with Pope Sextus Quintus; and then went to Florence, at the pressing invitation of Ferdinando grand duke of Tuscany, who had been cardinal at Rome when Tasso first resided there.

Having spent about another year at Florence, he returned again to Naples; and there applied himself to correct his *Jerusalem Delivered*. Soon after the publication of this work, Hippolito Aldrobandini succeeded Sextus Quintus to the papacy, by the name of *Clement the VIIth*; and his two nephews, Cynthio and Pietro Aldrobandini, were created cardinals. Cynthio, who was a great patron of learning and genius, and had known Tasso when he last resided at Rome, prevailed with him once more to leave his retreat at Naples, and live with him in that city. Here he continued till his 50th year; and being then again weary of his situation, and desirous to prosecute his law-suit, he obtained permission to retire once more to Naples, where he took up his abode with the Benedictine fathers in the convent of St Severin. Cardinal Cynthio, however, found means to recal him again to Rome, after a very short absence, by having prevailed with the Pope to confer upon him the honour of being publicly and solemnly crowned with laurel in the Capitol.

He set out from Naples to receive this honour, with a promise that he should never return; and arrived at Rome in the beginning of the year 1595, being then about 51 years old: he was met at the entrance of the city by many prelates and persons of distinction, and was introduced by the two cardinals to the pope, who complimented him by saying, "That his merit would confer as much honour on the laurel he was about to receive, as the laurel had formerly conferred on others." Orders were immediately given to decorate not only the pope's palace and the Capitol, but all the principal streets through which the procession was to pass: but Tasso, whether from an habitual dejection of mind, or a secret sensation of the first approaches of a disease which he apprehended would be fatal, declared that all these pompous preparations would be in vain.

It happened, that while they were waiting for fair weather to celebrate the solemnity, cardinal Cynthio fell sick; and, before he was perfectly recovered, Tasso himself was taken ill, and died on the 15th day of his sickness, aged 51. His poems have acquired him an immortal reputation. The principal of them are, 1. *Jerusalem Delivered*. 2. *Jerusalem Conquered*. 3. *Rinaldo*. 4. *The Seven Days of the Creation*. 5. *The Tragedy of Torimond*. 6. *Aminta*, &c. All Tasso's works were printed together at Florence in 1724, in six volumes folio, with the pieces for and against his *Jerusalem Delivered*. A splendid edition of this last poem was printed at Venice in 1745, in folio. The best edition of Mirebaud's French translation is that of Paris in 1735, in two vols 12mo. His *Aminta* and *Gierusalemme Liberata* have been translated into English.

TASTE, a certain sensation, or class of sensations, excited in the mind by certain bodies, which are called *sapid*, applied to the tongue and palate, and moistened with the saliva. This is the original and proper meaning of the word *taste* (see METAPHYSICS, n^o 46); but as the qualities of bodies which produce these sensations are unknown, they have in all languages got the names of the sensations themselves, by that figure of speech which substitutes the cause for the effect. Hence we talk of the tastes of sugar, wormwood, honey, vinegar, &c; and say, that the taste of sugar is sweet and of vinegar sour. Tastes have been divided into simple and compound; and philosophers have to very little purpose endeavoured to ascertain the number of each species. Attempts have likewise been made to determine from their tastes the effects of different substances on the human body, taken into the stomach as food or physic; but by stating the results of the various inquiries, we should be more likely to mislead the unlearned reader, than to communicate useful information to readers of any description.

Whoever is desirous of information on the subject may consult *Phil. Transf.* N^o 280, 299; and *Abercromb. Nov. Med. Clavis*.

Taste.

TASTE is likewise used in a figurative sense, to denote that faculty of the mind by which we perceive and enjoy whatever is beautiful or sublime in the works of nature or of art. Like the taste of the palate, this faculty relishes some things, is disgusted with others, and to many is indifferent; and from these obvious analogies between it and the external sense it has obtained its name. It has likewise been called an *internal sense*, and by one philosopher * *Dr Hume* a *reflex sense*; whilst others have considered it, not as a distinct faculty or sense, but as the joint exertion of perception and judgment in some cases, and as a play of the imagination in others.

To decide among these different opinions, it will be necessary to ascertain, if we can, what are the objects of this faculty; for we hardly think that every thing which is beautiful, either in nature or art, can with propriety be called an object of taste. *Scarlet, blue, green, and yellow*, are all beautiful colours, and a *cube* and a *sphere* are beautiful figures; but it does not appear to us, that a man could be said to have either a good or a bad taste for relishing the perception of a *scarlet* more than that of a *yellow* colour, or a *spherical* more than a *cubical* figure. A native of Africa considers thick lips and a flat nose as essential to female beauty; whilst the inhabitant of Europe prefers to all other forms of the nose that which is called *Grecian*, and is disgusted with lips either very thick or very thin. But upon what principles can we say that the African has a bad, and the European a good, taste?

With respect to the objects of the external sense, we are generally so constituted by nature as to relish, in the highest degree, those kinds of food which are most wholesome; and such a taste, which we believe is always found in infants, is justly said to be sound and uncorrupted. It is in the highest perfection too at first; for it depends not upon culture of any kind, and is incapable of improvement. The reverse of all this is the case with respect to internal taste; of which the variety is obvious to the most careless observer, and is found, on examination, to be still greater in reality than it is in appearance. Every voice is indeed united in applauding elegance, propriety, simplicity, spirit in writing; and in blaming sustenance, affectation, coldness, and a false brilliancy; but when critics come to particulars, this seeming unanimity vanishes; and it is found that they had affixed very different meanings to the same expressions. Perhaps no man ever attentively beheld the rising or the setting sun without feeling some emotions of pleasure which filled his mind; or went for the first time into such a building as the cathedral church of York, without being struck with a pleasing, though solemn, reverence. Yet it is certain, that the emotions of the clown, however acute he may be by nature, and perfect in all his faculties, are not the same, at least in degree, with those of the poet or philosopher when contemplating the rising or setting sun; or of the scientific mechanic when viewing the structure of the pillars and roof of the Gothic cathedral. We are not indeed sure that the pleasure of the clown on these occasions rises above that of mere sensation. Any bright and beautiful object presented to the eye, gives a pleasing sensation to the mind, in consequence of that peculiar agitation which such objects communicate to the optic nerves and the brain; and to us it appears, that the clown feels nothing more than this from the view of the rising sun or the magnificent church. Perhaps he may compare the sensations which he feels on these occasions with others which he has formerly felt in some degree similar to them, and have his pleasure heightened by the exercise

Taste.

exercise of that faculty of which the province is to judge upon comparison; but we have no reason to suppose, that from the rising sun he receives any emotions different in kind from what he would receive from a blazing heath, were it accompanied with the same varying tints of colour; or that the church impresses on his fancy more than that wonder with which he would view any other building equally large and equally novel, though of a form very different. In poetry and painting the vulgar are always delighted with the melody of the verse and the brilliancy of the colours; and think of nothing else as beauties, either in the one or in the other, unless the painting be the picture of some known object, and the poem describe scenes or actions in which they may be selfishly interested. Hence it is that the vulgar are more captivated by the splendor of the Venetian style of painting, than by the simple grandeur of the Roman and Bolognian Schools; for the art of the former, which has been carried to the highest degree of perfection, is to give pleasure to the eye or the sense; that of the latter is to fill the imagination. The powers exerted in the former school Sir Joshua Reynolds calls the *language of painters*, which he compares to an *empty tale told by an idiot, full of sound and fury, signifying nothing*. The compositions of the latter schools may be compared to the sublimity of Milton's sentiments, which would be disgraced by those petty ornaments to which it leaves not the reader at leisure to attend.

If this be so, the pleasures which the vulgar derive from what are called objects of taste are merely gratifications of the senses; or if any of these objects ever interest their higher faculties, it must be by inspiring them with confidence or dread; confidence of their own safety, for instance, if the building which they admire appear to them to be stable; and dread, if they have formed of it a contrary opinion. Very different is the pleasure which the man of cultivated taste derives from the beauties either of nature or of art: when he beholds the rising or the setting sun, he has indeed the pleasing sensation, which is all that the rude man feels; but along with this arises in his imagination a train of ideas, which hurries him beyond the object before him to its beneficent effects and its Almighty Creator: and if he has been much conversant with the works of descriptive poets, a number of pleasing ideas treasured up in his memory will, by the principle of association, pass in review before him, though they be not connected either with one another, or with the rising or setting sun, by a relation so close as that of cause and effect. In like manner, when the scientific architect views the Gothic cathedral, he must admire its solemn magnificence, though with less wonder than it excites in the breast of the clown; but he feels an additional pleasure, derived from a source to which the other has no access. He perceives the many contrivances displayed in its structure for uniting stability with lightness; and from contemplating the building, he is instantly led by a natural train of thought to admire the skill of the builder.

The nature of any person's taste, therefore, is generally determined from the character of his imagination and the soundness of his judgment. When any object either of sublimity or beauty is presented to the mind, every man is conscious of a train of thought being immediately awakened in his imagination, analogous to the character or expression of the original object. The simple perception of the object we frequently find is insufficient to excite these emotions, unless it is accompanied with this operation of mind; unless, according to common expression, our imagination is seized, and our fancy busied in the pursuit of all those trains of thought which are allied to this character or expression.

Thus, when we feel either the beauty or sublimity of natural scenery, the gay lustre of a morning in spring, or the mild radiance of a summer evening, the savage majesty of a wintry storm, or the wild magnificence of a tempestuous ocean, we are conscious of a variety of images in our minds, very different from those which the objects themselves can present to the eye. Trains of pleasing or of solemn thought arise spontaneously within our minds; our hearts swell with emotions, of which the objects before us seem to afford no adequate cause; and we are never so much satiated with delight, as when, in recalling our attention, we are unable to trace either the progress or the connection of those thoughts which have passed with so much rapidity through our imagination.

If the mind is in such a state as to prevent this freedom of imagination, the emotion, whether of sublimity or beauty, is unperceived. In so far as the beauties of art or nature affect the external senses, their effect is the same upon every man who is in possession of these senses. But to a man in pain or in grief, whose mind by these means is attentive only to one object or consideration, the same scene or the same form will produce no feeling of admiration, which, at other times, when his imagination was at liberty, would have produced it in its fullest perfection. It is upon the vacant and the unemployed, accordingly, that the objects of taste make the strongest impression. It is in such hours alone that we turn to the compositions of music or of poetry for amusement. The seasons of care, of grief, or of business, have other occupations, and destroy, for the time at least, our sensibility to the beautiful or the sublime, in the same proportion that they produce a state of mind unfavourable to the indulgence of imagination.

There are many objects of taste, however, which produce not their full effect on the imagination, but through the medium of the judgment. We have given one instance in architecture, and shall give another in sculpture. The beauty of the Farnese Hercules is one kind of beauty; that of the gladiator in the palace of Chigi another; and that of the Apollo of Belvidere a third. Each of these figures is acknowledged to be perfect in its kind; and yet Sir Joshua Reynolds affirms, that the highest perfection of the human figure is not to be found in any one of them, but in that form which might be taken from them all, and would partake equally of the activity of the gladiator, of the delicacy of the Apollo, and of the muscular strength of the Hercules. If the judgment of this eminent artist be admitted, the perfection of these statues cannot consist in any thing which is the immediate object of sense, either external or internal; but in something which, being perceived by the eye, is referred by the understanding to what we know of the characters of Hercules, Apollo, and the Gladiator, and which we believe it was the intention of the statuaries to express. Nay, there are objects of which taste is sometimes said to judge, though they have little or no effect whatever on the imagination. A book of abstract science, written in a prolix and intricate style, might be said to be in a bad taste; and had Swift, in his clear and simple style, written *An Essay on the Human Understanding*, his work, supposing him master of the subject, would undoubtedly have displayed more taste than Locke's, in which the terms are sometimes vague, and the periods often incumbered. This is actually the case of Berkeley, whom every man admits to have been a writer of good taste, though neither *The Principles of Human Knowledge*, *The Dialogues on Matter*, nor the beautiful work intitled *The Minute Philosopher*, is capable of affording pleasure to the senses or the imagination. His beauty consists merely in the perspicuity of his style, of which the understanding alone is the judge. The metaphysical

physical writings of Dr Reid possess in an eminent degree the same beauty; and no man of true taste can read them without admiring the elegant simplicity of the composition as much as the strength of the reasoning, and feeling from the whole a pleasure which the poetical style of Shafesbury cannot communicate.

If this be a just account of the pleasures of taste, that faculty cannot be properly considered as a mere internal sense, since to its enjoyments a well stored fancy is necessary in some cases, and the reasoning power in all; and the poet and the painter who wish to excel in their respective professions, must not content themselves, the one with filling the ear of the reader with mellifluous sounds, and the other with dazzling or deceiving the eye of the spectator by the brilliancy of his colours, but both must strive for fame by captivating the imagination; whilst the architect, who aspires to a similar celebrity, must make the purpose of his ornaments obvious to every person capable of judging. The landscapes of Claude Lorrain, the music of Handel, the poetry of Milton, excite feeble emotions in our minds, when our attention is confined to the qualities they present to our senses, or when it is to such qualities of their composition that we turn our regard. It is then only we feel the sublimity or beauty of their productions, when our imaginations are kindled by their power, when we lose ourselves amid the number of images that pass before our minds, and when we waken at last from this play of fancy as from the charm of a romantic dream.

It is well observed by Sir Joshua Reynolds*, that taste is sometimes praised in such terms by orators and poets, who call it *inspiration*, and a *gift from heaven*, that though a student by such praise may have his attention roused, and a desire excited of obtaining this gift, he is more likely to be deterred than encouraged in the pursuit of his object. "He examines his own mind, and perceives *there* nothing of that divine inspiration with which he is told so many others have been favoured. He never travelled to heaven to gather new ideas; and he finds himself possessed of no other qualifications than what mere common observation and a plain understanding are able to confer. Thus he becomes gloomy amidst the splendour of figurative declamation, and thinks it hopeless to pursue an object which he supposes out of the reach of human industry. But on this, as on many other occasions, we ought to distinguish how much is to be given to enthusiasm, and how much to common sense; taking care not to lose in terms of vague admiration that solidity and truth of principle upon which alone we can reason." Whoever possesses the ordinary powers of perception, sensibility of heart, good sense, and an imagination capable of being roused by the striking objects of nature and of art, may, without inspiration, become, by mere experience, a man of fine taste in the objects of which he aspires to be a critical judge.

This being the case, we may easily account for the variety of tastes which prevail among men, not only as individuals but as nations. We have already mentioned the difference in one instance between the European taste and the African respecting female beauty; and we may now affirm, as we hope to prove our affirmation, that the one taste is equally correct with the other. The charms of female beauty exist not in the mere external form and colour considered by themselves (for then the inanimate statue of the Venus de Medicis would give more delight to the European beholder than the finest woman that ever lived); but we associate external beauty with sweetness of disposition, and with all the train of endearments which take place in the union of the sexes; and it is this association which delights the man of taste, as giving refinement to an appetite which in

itself is gross and sensual. A similar association must be formed in the breast of the African who has any taste; and as he never knew feminine softness, or any of the endearing qualities of the sex, but as united with thick lips, a flat nose, a black skin, and woolly hair—a sable beauty of that description must excite in his breast the same emotions that are excited in the breast of an European by the fair woman with Grecian features.

But is there not an ideal or perfect beauty of the human form? There certainly is, as of every other natural object; but it cannot be the same in Europe as in Africa, unless to a Being who is acquainted with all the peculiarities of form, national and individual, that are to be found among the inhabitants of the whole earth. It has been supposed, and we think completely proved, by one of the best writers that we have on the philosophy of taste*, that the sublimity or beauty of forms arises altogether from the associations we connect with them, or the qualities of which they are expressive to us. The qualities expressed by the male and female forms are very different; and we would by no means think the woman beautiful who should have the form of the Farnese Hercules, or admire the shapes of the hero who should be formed like the Venus de Medicis; because the proportions of such a woman would indicate strength and intrepidity, where we wish to find only gentleness and delicacy; and the delicate form of the hero would indicate softness and effeminacy, where the opposite qualities only can be esteemed. As we associate with the female form many desirable qualities, every woman is esteemed more or less beautiful as her figure and features indicate a greater or smaller number of these qualities: and the same is the case with respect to the qualities which adorn the male character, and the form and features by which they are expressed. Upon comparing a number of human beings with one another, we find, that with respect to every feature and limb, there is one central form to which nature always tends, though she be continually deviating from it on the right hand and on the left: (See NOSE). This form therefore is considered as the most perfect form of the species, and most expressive of the qualities for which that species is valued; but in Africa, the central form, with respect to the proportions of the human body and the features of the human face, is very different from what it is in Europe; and therefore the ideal or perfect beauty of the human form and features cannot be the same in both countries. No doubt, if a man could examine the limbs and features of every individual of the human race, he would discover one central form belonging to the whole, and be led to esteem it the standard of beauty; but as this is obviously impossible, the common idea or central form belonging to each great class of mankind must be esteemed the standard of beauty in that class, as indicating most completely the qualities for which individuals are esteemed. Thus there is a common form in childhood and a common form in age; each of which is the more perfect as it is the more remote from peculiarities: but though age and childhood have something in common, we should not deem the child beautiful who was formed exactly like the most handsome man, nor the man handsome who was formed exactly like the most beautiful child. This doctrine is well illustrated by Sir Joshua Reynolds*, who has applied it to every object esteemed beautiful in nature; and proved, that the superiority of Claude Lorrain over the landscape-painters of the Dutch and Flemish schools, arises chiefly from his having generalized his conceptions, and formed his pictures by compounding together the various draughts which he had previously made from various beautiful scenes and prospects. "On the whole (says he), it seems to me that there is but one presiding principle which regulates and

Taste.

gives stability to every art. The works, whether of poets, painters, moralists, or historians, which are built upon general nature, live for ever: while those which depend for their existence on particular customs and habits, a particular view of nature, or the fluctuation of fashion, can only be coeval with that which first raised them from obscurity. All the individual objects which are exhibited to our view by nature, upon close examination, will be found to have their blemishes and defects. The most beautiful forms have something about them like weakness, minuteness, or imperfection. But it is not every eye that perceives these blemishes: It must be an eye long used to the contemplation and comparison of these forms; which alone can discern what any set of objects of the same kind has in common, and what each wants in particular."

From these reasonings the same great artist concludes, that the man who is ambitious of the character of possessing a correct taste, ought to acquire a "habit of comparing and dissecting his notions. He ought not to be wholly unacquainted with that part of philosophy which gives him an insight into human nature, and relates to the manners, characters, passions, and affections. He ought to know *something* concerning the *mind*, as well as a great deal concerning the *body*, and the various external works of nature and of art; for it is only the power of distinguishing right from wrong that is properly denominated *taste*."

"Genius and taste, in their common acceptation, appear to be very nearly related; the difference lies only in this, that genius has superadded to it a habit or power of execution. Or we may say, that taste, when this power is added, changes its name, and is called *genius*. They both, in the popular opinion, pretend to an entire exemption from the restraint of rules. It is supposed that their powers are intuitive; that under the name of *genius* great works are produced, and under the name of *taste* an exact judgment is given, without our knowing why, and without being under the least obligation to reason, precept, or experience.

"One can scarce state these opinions without exposing their absurdity; yet they are constantly in the mouths of men, and particularly of illiterate and affected connoisseurs. The natural appetite, or taste of the human mind, is for *truth*; whether that truth results from the real agreement or equality of original ideas among themselves, from the agreement of the representation of any object with the thing represented, or from the correspondence of the several parts of any arrangement with each other. It is the very same taste which relishes a demonstration in geometry, that is pleased with the resemblance of a picture to an original, and touched with the harmony of music.

"But besides *real*, there is also *apparent* truth, or opinion, or prejudice. With regard to real truth, when it is known, the taste which conforms to it is and must be uniform. With regard to the second sort of truth, which may be called *truth upon sufferance*, or *truth by courtesy*, it is not fixed but variable. However, whilst these opinions and prejudices on which it is founded continue, they operate as truth; and the art, whose office it is to please the mind as well as instruct it, must direct itself according to *opinion*, or it will not attain its end. In proportion as these prejudices are known to be generally diffused or long received, the taste which conforms to them approaches nearer to certainty, and to a sort of resemblance to real science, even where opinions are found to be no better than prejudices. And since they deserve, on account of their duration and extent, to be considered as really true, they become capable of no small degree of stability and determination by their permanent and uniform nature.

"Of the judgment which we make on the works of art, and the preference that we give to one class of art over another, if a reason be demanded, the question is perhaps evaded by answering, I judge from my taste; but it does not follow that a better answer cannot be given, though for common gazers this may be sufficient. Every man is not obliged to investigate the causes of his approbation or dislike. The arts would lie open for ever to caprice and casualty, if those who are to judge of their excellencies had no settled principles by which they are to regulate their decisions, and the merit or defect of performances were to be determined by unguided fancy. And indeed we may venture to assert, that whatever speculative knowledge is necessary to the artist, is equally and indispensably necessary to the critic and the connoisseur.

"The first idea that occurs in the consideration of what is fixed in art or in taste, is that presiding principle which we have already mentioned, the general idea of nature. The beginning, the middle, and the end of every thing that is valuable in taste, is comprised in the knowledge of what is truly nature; for whatever ideas are not conformable to those of nature or universal opinion, must be considered as more or less capricious; the idea of nature comprehending not only the forms which nature produces, but also the nature and internal fabric and organization, as I may call it, of the human mind and imagination. General ideas, beauty, or nature, are but different ways of expressing the same thing, whether we apply these terms to statues, poetry, or picture. Deformity is not nature, but an accidental deviation from her accustomed practice. This general idea therefore ought to be called *nature*; and nothing else, correctly speaking, has a right to that name. Hence it plainly appears, that as a work is conducted under the influence of general ideas, or partial, it is principally to be considered as the effect of a good or a bad taste."

Upon the whole, we may conclude that the real substance, as it may be called, of what goes under the name of *taste*, is fixed and established in the nature of things; that there are certain and regular causes by which the imagination and passions of men are affected; and that the knowledge of these causes is acquired by a laborious and diligent investigation of nature, and by the same slow progress as wisdom or knowledge of every kind, however instantaneous its operations may appear when thus acquired. A man of real taste is always a man of judgment in other respects; and those inventions which either disdain or shrink from reason, are generally more like the dreams of a disordered brain than the exalted enthusiasm of a sound and true genius. In the midst of the highest flights of fancy or imagination, reason ought to preside from first to last; and he who shall decide on the beauties of any one of the fine arts by an imaginary innate sense or feeling, will make as ridiculous an appearance as the connoisseur mentioned by Dr Moor, who praised as a work of the divine Raphael the wretched daubing by a Swiss copyist. The reader who wishes for further instruction in the philosophy of taste, may consult Gerard's Essay on Taste, with the dissertations of Voltaire, d'Alembert, and Montesquieu; Dr Blair's Lectures on the Belles Lettres; Dr Reid's Essays on the Intellectual Powers of Man; Alison's Essays on the Nature and Principles of Taste; and Sir Joshua Reynold's Discourses delivered in the Royal Academy.

TATE (Nahum), an English poet, born about the middle of the reign of Charles II. in Ireland, where he received his education. He was made poet-laureat to King William upon the death of Shadwell, and held that place until the reign of George I. whose first birth-day ode he lived

lived to write, and executed it with unusual spirit. He died in the mint in 1716, and was succeeded in the laurel by Mr Eusden. He was the author of nine dramatic performances, a great number of poems, and a version of the Psalms in conjunction with Dr Nicholas Brady.

TATIAN, a writer of the primitive church in the second century. He was born in Assyria, and trained up in the heathen religion and learning. Coming over to Christianity, he became the disciple of Justin Martyr, whom he attended to Rome. While Justin lived, he continued steadily orthodox: but after Justin's death he made a schism, and became the author of a new sect, condemning marriage, enjoining abstinence from wine and animal-food, and suffering only water to be used in the holy mysteries; whence his followers were called *Encratites* and *Hydroparastatae*. None of his works are now extant but his piece against the Gentiles: or, as it is usually intitled, his *Oration to the Greeks*.

TATIUS (Achilles), a native of Alexandria, was the author of a book on the sphere, which father Petau translated into Latin. There is also attributed to him a Greek romance on the loves of Leucippe and Clitophon, of which Salmafius has given a beautiful edition in Greek and Latin, with notes. Suidas says, that this Achilles Tattius was a Pagan, but that he afterwards embraced the Christian religion, and became a bishop. Photius mentions him in his *Bibliotheca*.

TATONNEUR, in zoology. See **LEMUR**.

TATTOOING, or **TARROWING**, an operation in use among the islanders in the South Sea for marking their bodies with figures of various kinds which they consider as ornamental. It is performed by puncturing the skin, and rubbing a black colour into the wounds. The instrument used somewhat resembles a comb, the teeth of which are repeatedly struck into the skin by means of a small mallet. It is very painful; but the children are forced by their relations to submit to it.

TATTOU, a beat of a drum at night to advertise the soldiers to retreat, or repair to their quarters in the garrison, or to their tents in a camp.

TAVERNIER (John Baptist), a famous French traveller, was born in 1605. In the course of 40 years he travelled six times to Turkey, Persia, and the East Indies, and visited all the countries in Europe, travelling mostly on foot. His travels have been frequently reprinted in six vols 12mo. He died on his seventh journey to the east, at Moseow, in 1699.

TAVIRA, or **TAVILA**, a considerable town of Portugal, and capital of the province of Algarve, with a handsome castle, and one of the best harbours in the kingdom, defended by a fort. It is seated in a pleasant fertile country, at the mouth of the river Gilao, between Cape Vincent and the Strait of Gibraltar, 100 miles west by north of Cadiz. W. Long. 7. 46. N. Lat. 37. 18.

TAVISOCK, a town of Devonshire in England, situated on the river Tavey or Tave, W. Long. 4. 12. N. Lat. 50. 37. It sends two members to parliament, and gives the title of *marquis* to the noble family of Russell duke of Bedford.

TAUNTON, a large, elegant, and well built town of Somersetshire, 146 miles from London. It consists principally of four streets paved and lighted; the market-place is spacious, and has a handsome market-house, with a town hall over it, which was finished in 1773. It has an extensive woollen manufactory; and in 1780 a silk manufactory was introduced. Its castle, the ruins of which remain, was in 1645 defended for the parliament by colonel Blake against an army of 10,000 men under lord Goring, but was dismantled by Charles II. In 1605 the duke of Monmouth

made this place his head-quarters. Its church, which is large and beautiful, is a fine specimen of the florid Gothic style of architecture. The tower, which is lofty, is of excellent workmanship, crowned at the top with four stately pinnacles, 32 feet high. The whole perhaps is not equalled in the kingdom. Taunton is pleasantly seated on the river Tone, which is navigable to Bridgewater; is reckoned the best town in the county; and sends two members to parliament. W. Long. 3. 17. N. Lat. 50. 49.

TAURIS, or **TEBRIS**, a town of Persia, and capital of Aderbeitzan. It was formerly the capital of Persia, and is now the most considerable next to Ispahan; for it contains 15,000 houses, besides many separate shops, and about 200,000 inhabitants. It is about five miles in circumference, and carries on a prodigious trade in cotton, cloth, silks, gold and silver brocades, fine turbans, and shagreen leather. There are 300 caravanferas, and 250 mosques. Some travellers suppose it to be the ancient Ecbatana; but of this there is no certainty. It is seated in a delightful plain, surrounded with mountains, from whence a stream issues, which runs through the city. E. Long. 47. 50. N. Lat. 38. 18.

TAURUS, a great chain of mountains in Asia, which begin at the eastern part of Little Carmania, and extend very far into the India. In different places they have different names.

TAURUS, in astronomy, one of the 12 signs of the zodiac.

TAUTOLOGY, a needless repeating of the same thing in different words.

TAWING, the art of dressing skins in white, so as to be fit for divers manufactures, particularly gloves, &c.

All skins may be tawed; but those chiefly used for this purpose are lamb, sheep, kid, and goat skins.

The method of tawing is this: Having cleared the skins of wool or hair by means of lime, they are laid in a large vatt of wood or stone, set on the ground full of water, in which quicklime has been slacked; wherein they are allowed to lie a month or six weeks, according as the weather is more or less hot, or as the skins are required to be more or less soft and pliant.

While they are in the vatt, the water and lime is changed twice, and the skins are taken out and put in again every day: and when they are taken out for the last time, they are laid all night to soak in a running water, to get out the greatest part of the lime; and in the morning are laid together by sixes one upon another, upon a wooden leg, and are scraped stoutly one after another, to get the flesh off from the fleshy side, with a cutting two-handed instrument called a *knife*; and then they cut off the legs (if they are not cut off before) and other superfluous parts about the extremes. Then they are laid in a vatt or pit with a little water, where they are filled with wooden pestles for the space of a quarter of an hour; and then the vatt is filled up with water, and they are rinsed in it.

In the next place, they are thrown on a clean pavement to drain, and afterwards call into a fresh pit of water, out of which they rinse them well, and are laid again on the wooden leg, six at a time, with the hair side outermost: over which they rub a kind of whetstone very briskly, to soften and fit them to receive four or five more preparations, given them on the leg both on the flesh-side and the hair-side, with the knife, after the manner above mentioned.

After this they are put into a pit of water and wheaten-bran, and stirred about in it with wooden poles, till the bran is perceived to stick to them, and then they are left: as they rise of themselves to the top of the water by a kind of fermentation, they are plunged down again to the bottom; and at the same time fire is set to the liquor, which burns as

Tau is

Tawing.

Tawing,
tax.

easily as if it were brandy, but goes out the moment the skins are all covered.

They repeat this operation as often as the skins rise above the water; and when they have done rising they take them out, lay them on the wooden leg, the fleshy side outwards, and pass the knife over them to scrape off the bran.

Having thus cleared them of the bran, they lay the skins in a large basket, and load them with hure bones to promote their draining: and when they have drained sufficiently, they give them their feeding; which is performed after the manner following:

For 100 of large sheep skins, and for smaller in proportion, they take eight pounds of alum and three of sea-salt, and melt the whole with water in a vessel over the fire, pouring the solution out, while yet lukewarm, into a kind of trough, in which is twenty pounds of the finest wheat-flour, with the yolks of eight dozen of eggs; of all which is formed a kind of paste, a little thicker than children's pap; which, when done, is put into another vessel, to be used in the following manner.

They pour a quantity of hot water into the trough in which the paste was prepared, mixing two spoonfuls of the paste with it; to do which they use a wooden spoon, which contains just as much as is required for a dozen of skins: and when the whole is well diluted, two dozen of the skins are plunged into it; but they take care that the water be not too hot, which would spoil the paste and burn the skins.

After they have lain some time in the trough they take them out, one after another, with the hand, and stretch them out; this they do twice: and after they have given them all their paste, they put them into tubs, and there tull them afresh with wooden pestles.

Then they put them into a vatt, where they are suffered to lie for five or six days, or more; then they take them out in fair weather, and hang them to dry on cords or racks: and the quicker they are dried the better; for if they be too long a-drying, the salt and alum within them are not to make them rise in a grain, which is an essential fault in this kind of dressing.

When the skins are dry, they are made up into bundles, and just dirt in fair water, and taken out and drained: they are then thrown into an empty tub; and after having lain some time are taken out and trampled under foot.

Then they draw them over a flat iron instrument, the top of which is round like a battledore, and the bottom fixed into a wooden block. to stretch and open them; and having been opened, they are hung in the air upon cords to dry; and being dry, they are opened a second time, by passing them again over the same instrument.

In the last place, they are laid on a table, pulled out, and laid smooth, and are then fit for sale.

TAX (*Taxa*, from the Greek *τάξις*, i. e. *ordo, tributum*), a tribute or imposition laid upon the subject for the support of government. See **REVENUE**.

It is the ancient indisputable privilege and right of the house of commons, that all grants of subsidies or parliamentary aids do begin in their house, and are first bestowed by them; although their grants are not effectual to all intents and purposes until they have the assent of the other two branches of the legislature. See **COMMONS**. The general reason given for this exclusive privilege of the house of commons is, that the supplies are raised upon the body of the people, and therefore it is proper that they alone should have the right of taxing themselves. This reason would be unanswerable, if the commons taxed none but themselves: but it is notorious, that a very large share of property is in the

possession of the house of lords; that this property is equally taxable, and taxed, as the property of the commons; and therefore the commons, not being the sole persons taxed, this cannot be the reason of their having the sole right of raising and modelling the supply. The true reason, arising from the spirit of our constitution, seems to be this. The lords being a permanent hereditary body, created at pleasure by the king, are supposed more liable to be influenced by the crown, and when once influenced to continue so, than the commons, who are a temporary elective body, freely nominated by the people. It would therefore be extremely dangerous to give the lords any power of framing new taxes for the subject; it is sufficient that they have a power of rejecting, if they think the commons too lavish or improvident in their grants. But so reasonably jealous are the commons of this valuable privilege, that herein they will not suffer the other house to exert any power but that of rejecting. They will not permit the least alteration or amendment to be made by the lords to the mode of taxing the people by a money-bill: under which appellation are included all bills by which money is directed to be raised upon the subject, for any purpose or in any shape whatsoever; either for the exigencies of government, and collected from the kingdom in general, as the land-tax; or for private benefit, and collected in any particular district, as by turnpikes, parish-rates, and the like. Yet Sir Matthew Hale mentions one case, founded on the practice of parliament in the reign of Henry VI. wherein he thinks the lords may alter a money-bill: and that is, if the commons grant a tax, as that of tonnage and poundage, for four years; and the lords alter it to a less time, as for two years: here, he says, the bill need not be sent back to the commons for their concurrence, but may receive the royal assent without farther ceremony; for the alteration of the lords is consistent with the grant of the commons. But such an experiment will hardly be repeated by the lords, under the present improved idea of the privilege of the house of commons; and, in any case where a money bill is remanded to the commons, all amendments in the mode of taxation are sure to be rejected.

The commons, when they have voted a supply to his majesty, and settled the *quantum* of that supply, usually resolve themselves into what is called a *committee of ways and means*, to consider the ways and means of raising the supply so voted. And in this committee every member (though it is looked upon as the peculiar province of the chancellor of the exchequer) may propose such scheme of taxation as he thinks will be least detrimental to the public. The resolutions of this committee (when approved by a vote of the house) are in general esteemed to be (as it were) final and conclusive. For though the supply cannot be actually raised upon the subject till directed by an act of the whole parliament, yet no monied man will scruple to advance to the government any quantity of ready cash, on the credit of a bare vote of the house of commons, though no law be yet passed to establish it.

The taxes which are raised upon the subject are either annual or perpetual.

I. The usual annual taxes are those upon land and malt. See **LAND** and **MALT**.

II. The perpetual are, 1. The customs. 2. The excise-duty. 3. The salt duty. 4. The post-office. 5. The stamp-duty. 6. House and window duty. 7. The duty on hackney-coaches and chairs. 8. That on offices and pensions.—See the articles **CUSTOMS**, **EXCISE**, **POST**, **STAMP**, **HOUSE**, **HACKNEY**, and **OFFICES and Pensions**.

As to the application of all these, see the articles **REVENUE**, **NATIONAL Debt**, **FUNDS**, and **Civil List**.

TAXATION. See REVENUE, TAX, and FEODAL System.

TAXUS, the YEW TREE, in botany: A genus of plants belonging to the class of *dicaia*, and order of *monodelphia*; and in the natural system ranking under the 5th order, *Cornifera*. The male calyx is triphyllous, gemmaceous, and imbricated: there is no corolla; and the stamina are numerous; the antheræ peltated and octofid. The female calyx resembles the male; there is no corolla nor style, and only one seed with a calycle resembling a berry very entire. There are only two species mentioned by Linnæus, the *baccata* and *nucifera*. M. Sonnerat has added a third, called *capensis*; and Sir Charles Thunberg has inserted two more, the *macrophylla* and *verticillata*, in his *Flora Japonica*.

The *baccata*, or common yew tree, is a native of Britain, France, Switzerland, &c. and of North America. It is distinguished from the other species by linear leaves which grow very close, and by the receptacles of the male flowers being subglobose. The wood is reddish, full of veins, and flexible, very hard and smooth, and almost incorruptible. Its hardness renders it very proper for turners and cabinet-makers. It produces berries which are red, mucilaginous, and have a sweet mawkish taste. They are often eaten by birds, and are therefore not poisonous: But it is a common opinion that the leaves are poisonous to cattle, and many facts are mentioned of horses and cows having died by eating them. Others, however, deny these facts. It is found in several parts of the Highlands of Scotland in a wild state. At Glenlure, near Glen-Creran, in Upper Lorn, are the remains of an old wood of it. The place takes its name from the trees which grow in it; for *Glenlure* in the Gaelic language is no other than a corruption of *Gleanuir*, i. e. "the valley of yew trees." It is of no great height, but the trunk grows to a large size. Mr Pennant has taken notice of a very remarkable decayed one in Fortingal church-yard, the remains of which measured 56 feet and an half in circumference.

The yew is at present almost peculiar to church-yards; hence some naturalists suspect that it is an exotic. Several reasons have been assigned for its frequency in church-yards. The first is, that before the invention of gunpowder the warrior might never be at a loss for a bow. This is an opinion for which we have found no historical evidence; and till some be produced it is considered merely as a conjecture. There are several laws enacted by our forefathers for encouraging archery, but none of them mention the cultivation of the yew. The bows used in England were indeed made frequently of yew, but it was yew of foreign growth. In the reign of Elizabeth, a bow of the best foreign yew sold for 6s. 8d. while one made of English yew sold only for 2s. In 12 Edw. IV. it was ordained that every foreign merchant that should convey any goods from any country from which bow-staves had formerly been brought to this country, should for every ton of goods bring four bow-staves. A similar law was framed in the time of Richard III. It appears therefore that the church-yards did not supply the nation with bows.

A second opinion concerning the introduction of yew trees into church-yards is, that they were intended to defend the church against storms. But there are many other trees that would have answered this purpose much better; for the yew is of so slow a growth, that it would be long before it could be of any service at all, and is so low that it could never be a sufficient shelter. A third opinion is, that being an evergreen, it is an emblem of immortality. This is a pretty idea; but the misfortune is, that yew is always considered as a tree of baleful influence. This opinion is as old as Statius, who says, *metuenda succo taxus*. A fourth

opinion is, that when anciently it was the custom, as it still is in Catholic countries, to carry palms on Palm-Sunday, the yew was substituted on such occasions for the palm. Two or three trees, the usual number growing in church-yards, were sufficient for such purposes. This is the only opinion which receives any countenance from history. The following extract from Caxton's *Direction for keeping Feasts all the Year*, printed in 1483, will probably be considered as decisive on this subject. It is taken out of the lecture for Palm-Sunday; where the writer, after giving the scriptural account of our Saviour's triumphant entrance into Jerusalem, proceeds thus: "Wherefore holy chirche this day makyth solempne processyon, in mynd of the processyon that Cryst made this day. But for encheleon that we have non olyue that berith grene leef, alate therefore we take ewe in stede of palme and olyue, and beren about in processyon, and so is thys day callyd Palme Sunday." As a confirmation of this fact, we may add, that the yews in the church-yards of East Kent are at this day called *palms*.

TAY, called by the Romans *Tarus* or *Taus*, the largest river in Scotland. It rises in Bruidallane, on the frontiers of Lorn; and having in the passage of a few miles augmented its stream by the accession of several small rills, spreads itself into a lake called *Loch D'hort*; out of which having run but a little space, it expands itself again. Leaving this second lake, it rolls some miles with a considerable body of water, and then diffuses itself abroad in the spacious Loch Tay; which, reckoning from the sources of the river, is 24 miles in length, though, strictly speaking, the lake is but 13; almost as soon as it issues from hence, it receives the river Lyon, coming out of Loch Lyon and running through Glen Lyon, which, having travelled in a manner parallel to it from its source, for a space of 25 miles, at length joins the Tay as it enters Athol, which it next traverses, and, directing its course in a manner due east, receives almost all the waters of that country. Bending then to the south, at the distance of six miles, it reaches Dunkeld; which, in the language of our ancestors, signifies "the hill of hazels," was the very centre of the old Caledonia, and is at present esteemed the heart of the Highlands. The river is very broad here, insomuch that there is a ferry-boat over it at each end of the town. Declining still to the south-east, with a winding course, for above 12 miles, the Tay receives a large supply of waters from the county of Angus; and then running south-west for eight miles more, is joined in that space by several rivers, the most considerable of which is the Almond. Turning then to the south-east, at the distance of about three miles, this copious river comes with a swelling stream to Perth, or St Johnstou's, which is the capital of the shire of that name.

The Tay, continuing still a south-east course, receives a few miles below Perth, the river Erne; which, issuing from a loch of the same name, traverses the county of Strathern, and passes by Abernethy, once the capital of the Pictish kingdom; swelled by the waters of this last river, the Tay, running next directly east, enlarges itself till it becomes about three miles broad; but contracts again before the town of Dundee; soon after which it opens into the German ocean. At the entrance of the frith, there are sands both on the north and on the south side: the former styled *Gro*, the latter *Aberlay* and *Drumlan*; and before these, in the very mouth of the frith, those which are called the *Cross Sands*. At Buttoneis, which is the northern promontory, there are two light-houses. The space between the north and the south sands may be near a mile, with about three fathoms water; but being within the frith, it grows deeper, and in the road of Dundee is full six fathoms. The frith

Tay.

Taylor.

of Tay is not indeed so large or so commodious as that of Forth, but from Buttonness to Perth it is not less than 40 miles; and the whole may be, without any great impropriety, styled a harrou, which has Fife on one side, and the shires of Perth and Angus on the other, both very fertile and pleasant countries.

TAYLOR (Dr Jeremy), bishop of Down and Connor in Ireland, was the son of a barber at Cambridge, and there had his education. Upon entering into orders, he became divinity lecturer of St Paul's in London; and was, by the interest of archbishop Laud, elected fellow of All soul's college, Cambridge, in 1636. Two years after he became one of the chaplains of the archbishop, who bestowed on him the rectory of Uppingham in Rutlandshire. In 1642 he was chaplain to the king; and a frequent preacher before him and the court at Oxford. He afterward attended in the king's army in the condition of a chaplain. Upon the declining of his majesty's cause, he retired into Wales, where he was permitted to officiate as minister, and to keep a school, in order to maintain himself and his children. In this retirement he wrote several of his works. Having spent several years there, his family was visited with sickness; and he lost three sons of great hopes within the space of two or three months. This affliction touched him so sensibly, that it made him desirous to leave the country; and, going to London, he for a time officiated in a private congregation of loyalists to his great hazard. At length meeting with Edward lord Conway, that nobleman carried him over with him into Ireland, and settled him at Portmore, where he wrote his *Ductor Dubitantium*. Upon the Restoration he returned to England; soon after, he was advanced to the bishopric of Down and Connor in Ireland; and had the administration of the see of Dromore granted to him. He was likewise made privy-counsellor and vice-chancellor of the university of Dublin; which place he held till his death. He died of a fever at Linnegarvy in 1677, and was interred in a chapel which he himself had built on the ruins of the old cathedral of Dromore.

TAYLOR (Dr Brook), was born at Edmonton, August 18th 1685. He was the son of John Taylor, Esq; of Bifron's-house in Kent, by Olivia, daughter of Sir Nicholas Tempest, of Durham, Baronet. His grandfather, Nathaniel Taylor, was one of those puritans whom "Cromwell thought fit to elect by a letter, dated June 14th 1653, to represent the county of Bedford in parliament." The character of his father partook in no small degree of the austerity that had been transmitted to him in the line of his ancestors, and by the spirit of the times in which they lived; and to this cause may be ascribed the disaffection which sometimes subsisted between the father and even such a son as is the subject of this article. The old gentleman's morose temper, however, yielded to the powers of music; and the most eminent professors of the art in that period were hospitably welcomed in his house. His son Brook was induced, by his natural genius, and by the disposition of his father, which he wished by all the means in his power to conciliate, to direct his particular attention to music; and he became in very early life a distinguished proficient in it.— "In a large family-piece, he is represented at the age of 13 sitting in the centre of his brothers and sisters; the two elder of whom, Olivia and Mary, crown him with laurel, bearing the insignia of harmony."

To music he added another accomplishment, in which he equally excelled. "His drawings and paintings, of which some are still preserved, require not those allowances for error or imperfection with which we scan the performances of even the superior *dilettanti* :—they will bear the test of scrutiny and criticism from artists themselves, and those of the

first genius and professional abilities." Though he was eminent in the culture and practice both of music and drawing in his early youth, his whole attention was not occupied by these fascinating arts. His classical education was conducted at home under a private tutor; and his proficiency in the ordinary branches of the languages and the mathematics was so great, that he was deemed qualified for the university at the early age of 15.

In 1701 he was entered a Fellow Commoner of St John's College, Cambridge. At that period mathematics engaged more particularly the attention of the university; and the examples of eminence in the learned world, derived from that branch of science, attracted the notice and roused the emulation of every youth possessed of talents and of application. We may presume, that Brook Taylor, from the very hour of his admission at college, adopted the course of study which a Machin, a Keil, and, above all, a Newton, had opened to the mind of man, as leading to discoveries of the celestial system.—That he applied early to these studies, and without remission, is to be inferred from the early notice and kind attention with which he was honoured by those eminent persons, and from the extraordinary progress which he made in their favourite science."

In 1708 he wrote his treatise *On the Centre of Oscillation*, which was not published in the *Philosophical Transactions* till some years afterwards. In 1709, he took his degree of Bachelor of Laws. In 1712, he was chosen a Fellow of the Royal Society. During the interval between these two periods, he corresponded with Professor Keil on several of the most abstruse subjects of mathematical disquisition. Sir William Young informs us, that he has in his possession a letter, dated in 1712, addressed to Mr Machin, which contains at length a solution of Kepler's problem, and marking the use to be derived from that solution. In this year he presented to the Royal Society three different papers: one *On the Ascent of Water between two Glass Plates*; a second, *On the Centre of Oscillation*; and a third, *On the Motion of a stretched String*. It appears from his correspondence with Keil, that in 1713 he presented a paper on his favourite subject of Music; but this is not preserved in the *Transactions*.

His distinguished proficiency in those branches of science, which engaged the particular attention of the Royal Society at this period, and which embroiled them in contests with foreign academies, recommended him to the notice of its most illustrious members; and in 1714 he was elected to the office of secretary. In this year he took at Cambridge his degree of Doctor of Laws; and at this time he transmitted, in a letter to Sir Hans Sloane, *An Account of some curious Experiments relative to Magnetism*; which, however, was not delivered to the Society till many years afterward, when it was printed in the *Transactions*. His application to those studies to which his genius inclined was indefatigable: for we find that in 1715 he published in Latin his *Methodus Incrementorum*; also a curious essay preserved in the *Philosophical Transactions*, entitled *An Account of an Experiment for the Discovery of the Laws of Magnetic Attraction*; likewise a treatise well known to mathematicians, and highly valued by the best judges, *On the Principles of Linear Perspective*. In the same year (such were his admirable talents, and so capable were they of being directed to various subjects), he conducted a controversial correspondence with the Count Raymond de Montmort, on the *Tenets of Malebranche*; which occasioned his being particularly noticed in the eulogium pronounced by the French academy on the decease of that eminent metaphysician.

The new philosophy of Newton (as it was then called)

engaged the attention of mathematicians and philosophers both at home and abroad. At Paris it was in high estimation; and the men of science in that city were desirous of obtaining a personal acquaintance with the learned secretary of the Royal Society, whose reputation was so generally acknowledged, and who had particularly distinguished himself in the Leibnitzian or German controversy, as we may denominate it, of that period. In consequence of many urgent invitations, he determined to visit his friends at Paris in the year 1716. He was received with every possible token of affection and respect; and had an opportunity of displaying many traits of character, which mark the general scholar and accomplished gentleman, as well as the profound mathematician. His company was courted by all "who had temper to enjoy, or talents to improve, the charms of social intercourse." Besides the mathematicians, to whom he had always free access, he was here introduced to Lord Bolingbroke, the Count de Caylus, and Bishop Bossuet. "He inspired partiality on his first address; he gained imperceptibly on acquaintance; and the favourable impressions which he made from genius and accomplishments, he fixed in further intimacy by the fundamental qualities of benevolence and integrity."

Among the ladies who honour'd Dr Brook Taylor with a particular regard, we may mention the names of Marquise de Villette, and of Miss Brunton, the beautiful and accomplished niece of Sir Isaac Newton.

Early in 1717 he returned to London, and composed three treatises, which were presented to the Royal Society, and published in the 30th volume of the Transactions. About this time his intense application had impaired his health to a considerable degree; and he was under the necessity of repairing, for relaxation and relief, to Aix-la-Chapelle. Having likewise a desire of directing his attention to subjects of moral and religious speculation, he resigned his office of secretary to the Royal Society in 1718.

After his return to England in 1719, he applied to subjects of a very different kind from those that had employed the thoughts and labours of his more early life. Among his papers of this date, Sir William Young has found detached parts of A Treatise on the Jewish Sacrifices, and a dissertation of considerable length On the Lawfulness of eating Blood. He did not, however, wholly neglect his former subjects of study, but employed his leisure hours in combining science and art; with this view he revised and improved his treatise on Linear Perspective. Drawing continued to be his favourite amusement to his latest hour; and it is not improbable, that his valuable life was shortened by the sedentary habits which this amusement, succeeding his severer studies, occasioned.

"He drew figures with extraordinary precision and beauty of pencil. Landscape was yet his favourite branch of design. His original landscapes are mostly painted in water colours, but with all the richness and strength of oils. They have a force of colour, a freedom of touch, a varied disposition of planes of distance, and a learned use of aerial as well as linear perspective, which all professional men who have seen these paintings have admired. Some pieces are compositions; some are drawn from nature; and the general characteristic of their effect may be exemplified, in supposing the bold fore-grounds of Salvator Rosa to be backed by the succession of distances, and mellowed by the sober harmony, which distinguish the productions of Gaspar Poussin. The small figures interspersed in the landscapes would not have disgraced the pencil of the correct and classic Nicholas."

The work of Dr Brook Taylor in linear perspective was censured by Bernoulli, in a treatise published in the *Acta*

of Leipzig, as "abstruse to all, and as unintelligible to artists for whom it was more especially written." It must be acknowledged that this excellent work, for so it deserves to be called, was not level to the apprehensions of practitioners in the art of drawing and design: but it was much esteemed by mathematicians. Three editions of it have been published; and as it is now scarce, a republication of it in its most improved and perfect state would be very acceptable. Mr Kirby, however, has made it more plain and popular, in his treatise entitled "Brook Taylor's Perspective made easy;" and this book, detailing and illustrating the principles of the original work, has been the *vade mecum* of artists. Dr Brook Taylor was incensed by the invidious attacks of Bernoulli; and he published An Apology against J. Bernoulli's Objections, which may be seen in the 30th volume of the Philosophical Transactions. Bernoulli, with his usual envy of British mathematicians, had disputed our author's right to his own work. We have no reason to doubt Dr Taylor's claims to the undecided discovery of the method which he describes, though he is not an original inventor. This method was long before published by Guido Ubbaldi, in his Perspective, printed at Pesaro in 1600; where it is delivered very clearly, and confirmed by most elegant demonstrations; and where it is actually applied to the art of delineating the scenes of a theatre.

Toward the end of the year 1720, Dr Brook Taylor accepted the invitation of Lord Bolingbroke to spend some time at La Source, a country-seat near Orleans, which he held in right of his wife, the widow of the Marquis de Villette, nephew of Madame de Maintenon. During his residence at this beautiful spot, he fixed and cemented a friendship with its noble owners which terminated only with life.

In the next year he returned to England, and published the last paper which appears with his name in the Philosophical Transactions, entitled, An Experiment made to ascertain the Proportion of Expansion of Liquor in the Thermometer, with regard to the degree of Heat.

In 1721, Dr Brook Taylor married Miss Bridges of Wallington in the county of Surry, a young lady of good family, but of small fortune; and this marriage occasioned a rupture with his father, whose consent he had never obtained. The death of this lady in 1725, and that of an infant son, whom the parents regarded as the preface and pledge of reconciliation with the father, and who actually proved such, deeply affected the sensibility of Dr Taylor. However, during the two succeeding years he resided with his father at Bifrons, where "the musical parties, so agreeable to his taste and early proficiency, and the affectionate attentions of a numerous family welcoming an amiable brother, so long estranged by paternal resentment, not only soothed his sorrows, but ultimately engaged him to a scene of country retirement, and domesticated and fixed his habits of life. He could no more recur to the desultory resources and cold solace of society, which casual visits, slight acquaintance, and distant friendships, afford the man—who hath *none to make, and cheer a constant home.*"

In 1725 he formed a new connection; and with the full approbation of his father and family, married Sabetta, daughter of John Sawbridge, Esq; of Olantigh, in Kent. In 1729, on the death of his father, he succeeded to the family estate of Bifrons. In the following year he lost his wife in child-bed. The daughter whose birth occasioned this melancholy event survived, and became the mother of Sir William Young, to whom we owe these memoirs of his grandfather.

In the interval that elapsed between the years 1721 and 1725, no production by Brook Taylor appears in the Philosophical

Taylor,
Fca.

philosophical Transactions; nor did he publish in the course of that time any work. His biographer has found no traces of his learned labour, excepting a Treatise of Logarithms, which was committed to his friend Lord Paisley (afterward Abercorn), in order to be prepared for the press; but which probably was never printed. His health was now much impaired; relaxation became necessary, and he was diverted by new connections from the habit of severe study, which had distinguished the early period of his life, and which had contributed to contract the duration of it. Happy in the social circle of domestic enjoyment, and devoting his attention to business or amusement as they occurred, his application and his literary emulation seem to have declined. He did not long survive the loss of his second wife; and his remaining days were days of increasing imbecillity and sorrow.

“The essay entitled *Contemplatio Philosophica*, published by Sir William Young, 1793, appears to have been written about this time, and probably with a view to abstract his mind from painful recollections and regret. It was the effort of a strong mind, and is a most remarkable example of the close logic of the mathematician applied to metaphysics. But the blow was too deep at heart for study to afford more than temporary relief. The very resource was hurtful, and intense study but accelerated the decline of his health. His friends offered every comfort; in particular Lord Bolingbroke pressed his consolation, and sought to call his mind from regret of domestic endearments to social friendship at Dawley.

The attention and kindness of his friends, however, could not ward off the approaches of dissolution. “Having survived his second wife little more than a year, Dr Brook Taylor died of a decline in the 46th year of his age, December the 29th 1731, and was buried in the church yard of St Ann’s, Soho. I am spared (says his descendant) the necessity of closing this biographical sketch with a prolix detail of his character: in the best acceptance of duties relative to each situation of life in which he was engaged, his own writings, and the writings of those who best knew him, prove him to have been the finished Christian, gentleman, and scholar.”

TAYLOR (Dr John), a learned dissenting minister, born in Lancashire. He settled first at Kirkstead in Lincolnshire, where he preached to a small congregation, and taught a grammar school for near 20 years. Afterward he removed to Norwich, where he preached many years in great repute, until he was invited to superintend the academy formed at Warrington in Lancashire: but a few idle differences on formal punctilios and uncertain doctrines kindled into such a flame there, as subjected him to much scurrility and ill treatment, and endangered the very being of the academy. He died in 1761; and among several other judicious performances, his Hebrew and English Concordance, 2 vols folio, will remain a monument of his critical skill and indefatigable industry.

TAYLOR-BIRD. See MOTACILLA.

TEA, the dried leaves of the tea plant.—A commodity with which we are so well acquainted, which affords a beverage so generally used and so generally agreeable, and which forms so considerable an article of commerce, must excite the curiosity of the public at large to know something of its history, and of the nature of the

plant from which it is obtained. We are sorry that we can neither gratify their curiosity nor our own completely. We have consulted all the botanical books to which we had access, and we believe we have had access to the best, yet we have not been able to discover with certainty whether there be various species of the tea plant; or whether all the different kinds of tea, so unlike to one another in their flavour, and strength, and colour, be derived from one single species. As an apology for this imperfection in botanical knowledge, it is proper to observe, that the country of which the tea plant is a native is hidden from the exploring eye of the philosopher; that it is jealous of Europeans, and seldom gives them an opportunity of surveying its productions. While we apologize for the ignorance of Europeans in this point, and sincerely regret it, we shall be careful to select every important fact, that we may present our readers with as accurate and complete an account as our materials can supply.

The tea plant is a native of Japan, China, and Tonquin, and has not, as far as we can learn, been found growing spontaneously in any other parts of the world. Linnæus arranged it under the class of *polyandria*, and order of *monogynia*. We are told he was led into this mistake from having no specimens of the flower to examine but such as were dried. If Linnæus has in this arrangement fallen into error, it is surprising that he has not been corrected by one who had the best opportunity of examining the matter. Sir Charles Thunberg, one of the most distinguished pupils of that illustrious botanist, who resided 16 months in Batavia and Japan, has given a full botanical description of the tea plant; and having classed it in the same manner as his master, says expressly that it has only one style. Several of the British botanists, on the other hand, refer it to the order of *trigynia*; deriving their authority from a plant in the Duke of Northumberland’s garden at Sion-house, which had three styles.

Linnæus says that there are two species of the tea plant; the *bohea*, the corolla of which has six petals; and the *viridis* or green tea, which has nine petals. Thunberg makes only one species, the *bohea*, consisting of two varieties: the one with broad and the other with narrow leaves. This botanist’s authority is decisive respecting the Japanese tea plants; but as China has not yet been explored, we cannot determine what number of species there are in that country. Of the *bohea* plant we have been favoured with a beautiful drawing, and an accurate botanical description, by a learned gentleman, which we shall here present to our readers.

Calyx. K, fig. 1, 2, 3, 10. a perianthium quinquepartite, very small, flat, the segments round, obtuse, permanent. Fig. 1. K.

Corolla. C, fig. 1, 3, 4, 5, 7, 8. the petals six, roundish, concave; two exterior (fig. 4, 7.) CC; less, unequal, inclosing the flower before fully blown (fig. 3.) C; four interior (fig. 5, 6.) CCCC; large, equal, before they fall off recurvate (fig. 8.) CC; (A).

Stamens. f, fig. 6, 9, 10, 11. the filaments numerous (B) fig. 6, 9. *fa*; about 200; filiform, white, shorter than the corolla, and inserted in the receptacle; *a*, the antheras cordate; and didymous (fig. 10, 11.) *, magnified (c).

Pistillum. Fig. 1, 10, 12. * magnified; *g*, the germen, three globular bodies joined in a triangular form; *s*, the styles, three, connected at their base (fig. 12.); subulate,

re-

(A) Thunberg says, that three of the petals are exterior and three interior.

(B) In a flower received from J. Ellis, Esq; upwards of 280 filaments were told.

(C) Kempfer describes the antheras as single.

recurvate, of the length of the stamens, pressed together, and as if united in one by the thickset surrounding stamens (D) fig. 6, 9, 10.; but after the petals and stamens have fallen off they part, spread open, increase in length, and wither on the germen, fig. 1, 12.; the stigmas simple, *t*, fig. 1, 9, 10, 12.

Pericarpium. P, fig. 1, 13, 14. a capsule in the form of three globular bodies united, fig. 13. trilobular, fig. 14. gaping at the top in three directions, fig. 13.

Seeds. S, fig. 14. single, globose, angulate on the inward side.

Trunk. T, fig. 1. ramose, lignous, round; branches alternate, vague, bluish, inclining to ash colour, towards the top reddish; the peduncles axillary, *p*, fig. 1. alternate, single, curved, uniflorous, incrassate, fig. 1, 2, 7. stipulate, the stipula single; subulate, erect, *d*, fig. 1, 2, 7, 9.

Leaves. F, fig. 1, 15, 16, 17. alternate, elliptical, obtusely serrated, with the edges between the teeth recurvate, with the apex emarginate (E) * magnified, fig. 15. *e*, at the base very entire, fig. 16, 17. the surface smooth, glossy, bullate, venose on the under side, of a firm texture, petiolate; the petiols very short, *b*, fig. 1, 16, 17. round on the under side, gibbous, fig. 16. *b*, * magnified; on the upper side flattish and slightly channelled, fig. 17. *b*.

The tea plant, which is an evergreen, grows to the height of five or six feet; Le Compte says ten or twelve. The leaves, which are the only valuable part of it, are about an inch and a half long, narrow, indented, and tapering to a point, like those of the sweet briar, and of a dark green colour. The root is like that of the peach tree, and its flowers resemble those of the white wild rose. The stem spreads into many irregular branches. The wood is hard, of a whitish green colour, and the bark is of a greenish colour, with a bitter, nauseous, and astringent taste. The fruit is small, and contains several round blackish seeds, about the bigness of a bean or large pea.

This plant delights in valleys, is frequent on the sloping sides of mountains and the banks of rivers, where it enjoys a southern exposure. It flourishes in the northern latitudes of Pekin as well as round Canton, but attains the greatest perfection in the mild temperate regions of Nankin. It is said only to be found between the 30th and 45th degree of north latitude. In Japan it is planted round the borders of fields, without regard to the soil; but as it is an important article of commerce with the Chinese, whole fields are covered with it, it is by them cultivated with care. The Abbé Roehen says, it grows equally well in a poor as in a rich soil; but that there are certain places where it is of a better quality. The tea which grows in rocky ground is superior to that which grows in a light soil; and the worst kind is that which is produced in a clay soil. It is propagated by seeds; from six to twelve are put into a hole about five inches deep, at certain distances from each other. The reason why so many seeds are sown in the same hole is said to be, that only a fifth part vegetate. Being thus sown, they grow without any other care. Some, however, manure the land, and remove the weeds; for the Chinese are as fond of good tea, and take as much pains to procure it of an excellent quality, as the Europeans do to procure excellent wine.

The leaves are not fit for being plucked till the shrub be

VOL. XVIII. Part I.

of three years growth. In seven years it rises to a man's height; but as it then bears but few leaves, it is cut down to the stem, and this produces a new crop of fresh shoots the following summer, every one of which bears nearly as many leaves as a whole shrub. Sometimes the plants are not cut down till they are ten years old. We are informed by Kœmpfer, that there are three seasons in which the leaves are collected in the isles of Japan, from which the tea derives different degrees of perfection.

The first gathering commences at the end of February or beginning of March. The leaves are then small, tender, and unfolded, and not above three or four days old: these are called *ficki-tsian*, or "tea in powder," because it is pulverised; it is also called *imperial tea*, being generally reserved for the court and people of rank; and sometimes also it is named *bloom tea*. It is sold in China for 20 d. or 2 s. per pound. The labourers employed in collecting it do not pluck the leaves by handfuls, but pick them one by one, and take every precaution that they may not break them. However long and tedious this labour may appear, they gather from 4 to 10 or 15 pounds a-day.

The second crop is gathered about the end of March or beginning of April. At this season part of their leaves have attained their full growth, and the rest are not above half their size. This difference does not, however, prevent them from being all gathered indiscriminately. They are afterwards picked and assorted into different parcels, according to their age and size. The youngest, which are carefully separated from the rest, are often sold for leaves of the first crop, or for imperial tea. Tea gathered at this season is called *too-tsian*, or "Chinese tea," because the people of Japan infuse it, and drink it after the Chinese manner.

The third crop is gathered in the end of May or in the month of June. The leaves are then very numerous and thick, and have acquired their full growth. This kind of tea, which is called *Ben-tsian*, is the coarsest of all, and is reserved for the common people. Some of the Japanese collect their tea only at two seasons of the year, which correspond to the second and third already mentioned; others confine themselves to one general gathering of their crop, towards the month of June: however, they always form afterwards different assortments of their leaves.

The finest and most celebrated tea of Japan is that which grows near Ud-si, a small village situated close to the sea, and not far distant from Meaco. In the district of this village is a delightful mountain, having the same name, the climate of which is said to be extremely favourable to the culture of tea; it is therefore inclosed by a hedge, and surrounded with wide ditches, which prevent all access to it. The tea shrubs that grow on this mountain are planted in regular order, and are divided by different avenues and alleys.

The care of this place is entrusted to people who are ordered to guard the leaves from dust, and to defend them from the inclemency of the weather. The labourers who are appointed to collect the tea abstain from every kind of gross food for some weeks before they begin, that their breath and perspiration may not in the least injure the leaves. They gather them with the most scrupulous nicety, and never touch them but with very fine gloves. When this choice tea has undergone the process necessary for its

T t

pre-

(D) It was this circumstance that led Linnæus to place it under the order monogynia.

(E) No author has hitherto remarked this obvious circumstance; even Kœmpfer says the leaves terminate in a sharp point.

Tea.

preparation, it is escorted by the superintendent of the mountain and a strong guard to the emperor's court, and reserved for the use of the imperial family.

As the tea shrub grows often on the rugged banks of steep mountains, access to which is dangerous, and sometimes impracticable, the Chinese, in order to come at the leaves, make use of a singular stratagem: These steep places are generally frequented by great numbers of monkeys, which being irritated and provoked, to revenge themselves tear off the branches, and shower them down upon those who have intuled them. The Chinese immediately collect these branches, and strip them of their leaves.

When the tea leaves have been collected, they are exposed to the steam of boiling water; after which they are put upon plates of copper, and held over the fire until they become dry and shrivelled, and appear such as we have them in Europe. According to the testimony of Kœmpfer, tea is prepared in the same manner in the isles of Japan. "There are to be seen there (says this traveller) public buildings erected for the purpose of preparing the fresh gathered tea. Every private person who has not suitable conveniences, or who is unacquainted with the operation, may carry his leaves thither as they dry. These buildings contain a great number of small stoves raised about three feet high, each of which has a broad plate of iron fixed over its mouth. The workmen are seated round a large table covered with mats, and are employed in rolling the tea leaves which are spread out upon them. When the iron plates are heated to a certain degree by the fire, they cover them with a few pounds of fresh gathered leaves, which being green and full of sap crackle as soon as they touch the plate. It is then the business of the workman to stir them with his naked hands as quickly as possible, until they become so warm that he cannot easily endure the heat. He then takes off the leaves with a kind of shovel, and lays them upon mats. The people who are employed in mixing them, take a small quantity at a time, roll them in their hands always in the same direction; while others keep continually stirring them, in order that they may cool sooner, and preserve their shrivelled figure the longer. This process is repeated two or three times, and even oftener, before the tea is deposited in the warehouses. These precautions are necessary to extract all the moisture from the leaves."

The people of Japan and China generally keep their tea a year before using it, because, when quite fresh and newly gathered, it possesses a narcotic quality which hurts the brain. Imperial tea is generally preserved in porcelain vases, or in leaden or tin canisters covered with fine mats made of bamboo. Common tea is kept in narrow-mouthed earthen pots; and coarse tea, the flavour of which is not so easily injured, is packed up in baskets of straw.

An infusion of tea is the common drink of the Chinese; and indeed when we consider one circumstance in their situation, we must acknowledge that Providence has displayed much goodness in scattering this plant with so much profusion in the empire of China. The water is said to be unwholesome and nauseous, and would therefore perhaps, without some corrective, be unfit for the purposes of life. The Chinese pour boiling water over their tea, and leave it to infuse, as we do in Europe; but they drink it without any mixture, and even without sugar. The people of Japan reduce theirs to a fine powder, which they dilute with warm water until it has acquired the consistence of thin soup. Their manner of serving tea is as follows: They place before the company the tea equipage, and the box in which this powder is contained; they fill the cups with warm water, and taking from the box as much powder as the point of a knife can contain, throw it into each of the cups, and

stir it with a tooth-pick until the liquor begins to foam; it is then presented to the company, who sip it while it is warm. According to F. du Halde, this method is not peculiar to the Japanese; it is also used in some of the provinces of China.

The first European writer who mentions tea is Giovanni Botero, an eminent Italian author, who published a treatise about the year 1590, Of the Causes of the Magnificence and Greatness of Cities. He does not indeed mention its name, but describes it in such a manner that it is impossible to mistake it. "The Chinese (says he) have an herb out of which they press a delicate juice, which serves them for drink instead of wine: it also preserves their health, and frees them from all those evils which the immoderate use of wine produces among us *."

Tea was introduced into Europe in the year 1610 by the Dutch East India Company. It is generally said, that it was first imported from Holland into England, in 1656, by the lords Arlington and Ossory, who brought it into fashion among people of quality. But it was used in coffee-houses before this period, as appears from an act of parliament made in 1660, in which a duty of 8 d. was laid on every gallon of the infusion sold in these places. In 1666 it was sold in London for 60 s. per pound, though it did not cost more than 2 s. 6 d. or 3 s. 6 d. at Batavia. It continued at this price till 1707. In 1715 green tea began to be used; and as great quantities were then imported, the price was lessened, and the practice of drinking tea descended to the lower ranks †. In 1720 the French began to send it to us by a clandestine commerce. Since that period the demand has been increasing yearly, and it has become almost a necessary of life in several parts of Europe, and among the lowest as well as the highest ranks.

The following table will give an idea of the quantity of tea imported annually into Great Britain and Ireland since 1717:

From 1717 to 1726	-	700,000 lbs.
1732 to 1742	-	1,200,000
1755 near	-	4,000,000
1766	-	6,000,000
1785 about	-	12,000,000
1794 from	16 to	22,000,000

Besides these immense quantities imported into Britain and Ireland, much has been brought to Europe by other nations. In 1766 the whole tea imported into Europe from China amounted to 17 millions of pounds; in 1785 it was computed to be about 19 millions of pounds ‡.

Several researches have been made in Europe to determine whether the tea plant grows spontaneously; but these researches have been hitherto in vain. When Captain Cook visited Teneriffe in his last voyage, Mr Anderson his surgeon was informed by a gentleman of acknowledged veracity, that a shrub is common near Santa Cruz which agrees exactly with the description given of the tea-plant by Linnæus. It is considered as a weed, and large quantities are rooted out of the vineyards every year: But the Spaniards who inhabit the island sometimes make use of it, and ascribe to it all the qualities of the tea imported from China.

Many attempts have been made to introduce this valuable plant into Europe; but from want of proper precautions most of these attempts have miscarried. The seeds, being of an oily nature, are apt to grow rancid during a long voyage, unless proper care is taken to preserve them. There are two methods of preserving these seeds: The first is, to inclose them in wax after they have been dried in the sun; the second is, to leave them in their husks, and shut them up closely in a box made of tin: but neither of these methods has been attended with general success, whatever

care has been taken to obtain fresh seeds, or to preserve them. The best method would be, to sow fresh seeds in fine light earth immediately on leaving Canton, and to cover them with wire to secure them from rats and other animals that might attack them. The boxes ought not to be too much exposed to the air, nor to that kind of dew which rises from the sea. The earth in the boxes must neither be hard nor dry, and should from time to time be gently watered with fresh or rain water; and when the shoots begin to appear, they ought to be kept in a slight moisture, and sheltered from the sun. The tea-plants to be found in England have been procured by these means only; and though several of the young rising shoots perished, the last method proposed is probably that which may be followed with greatest success.

The finest tea-plant known in England was raised in Kew gardens; it was carried thither by Sir J. Ellis, who brought it from seed: but the first that ever flourished in Europe was one belonging to the Duke of Northumberland at Sion, from a drawing of which our engraving is taken. The plants which are cultivated in the gardens near London thrive well in the green-house during winter, and some stand that season in the open air. Linnæus, who obtained this shrub in its growing state, contrived to preserve it in the open air in the northern latitude of Sweden. France has also procured some plants. There can be no doubt but they would succeed in many countries of Europe, if proper care were paid to their cultivation till they became inured to one climate. It will be a great advantage if we can rear that plant, which can never suffer so much from change of soils as from growing muggy during the long voyage from China. Besides, the demand for tea is now become so great, that the Chinese find it necessary, or at least profitable, to adulterate it. Bad tea is now become an universal complaint. The Abbé Grosier tells us, that there is a kind of moss which grows in the neighbourhood of the little city of Mang-ine-hien, which is sold as a delicate species of tea. If this delicious commodity is adulterated in China, can we flatter ourselves that none comes to us but what is pure and un-mixed? How would our fine ladies like to be told, that instead of tea they drink nothing but the infusion of moss from the rocks of Mang-ine-hien (F)?

Of the chemical qualities and effects of tea on the constitution, many various and opposite opinions have been formed. About a century ago, Bontikoe, a Dutch physician, bestowed extravagant encomiums on the benefits of tea. With him it was good for every thing; and any quantity might be drunk, even to the amount of 200 dishes in a

day. Whether Bontikoe in this case acted as a physician, or, being a Dutchman, was eager to encourage the sale of an important article of his country's commerce, is not easy to say. On the other hand, the pernicious effects of tea upon the nervous system have been often repeated, and very opposite effects have been ascribed to it. Some affirm that green tea is mildly astringent; others say it is relaxing: Some say it is narcotic, and procures sleep; while others contend, that taken before bed-time it assuredly prevents it.

Dr Lettsom, who has written the Natural History of the Tea Tree, made several experiments to determine its chemical qualities. He found an infusion of it preserved beef fresh; it is therefore antiseptic; and from its striking a purple colour with the salt (sulphate) of iron, he justly concludes that it is astringent. He concludes also, that the essential qualities of tea reside in its fragrant and volatile parts.

We have heard much of the bad effects of tea, but we have neither felt nor observed it. If it were so pernicious as it has been represented by some, its effects must certainly be evident in China, where it is drunk by all ranks; yet so far from being thought hurtful in that country, it is in high estimation. The present emperor has composed a kind of eloge on the virtues of tea. We are told by those who have written the history of China, that inflammatory diseases are less frequent there than in many other countries, which is ascribed solely to the liberal use of tea. It must be observed by all, that tea is an antidote against intemperance, and that he who relishes the one seldom runs into the other. Raynal says, that tea has contributed more to the sobriety of this nation than the severest laws, the most eloquent harangues of Christian orators, or the best treatises of morality. We have no doubt but it may be hurtful to some constitutions in particular circumstances; but we suspect that the nervous disorders so often attributed to tea, are rather owing to hereditary diseases, to want of exercise, and to irregularity in food or sleep, than to tea. "Weak tea drunk too hot (says Dr Leake) will enervate, and if very strong, may prove equally pernicious by affecting the head or stomach. But when it is drunk in moderation, and not too warm, with a large addition of milk, I believe it will seldom prove hurtful, but, on the contrary, salutary. After study or fatigue it is a most refreshing and grateful repast; it quenches thirst, and cheers the spirits, without heating the blood; and the pleasing society, in which we so often partake of it, is no inconsiderable

T t 2

addi.

(F) There is very good reason to believe, that the adulteration of tea is not confined to China. It is practised, and often with too much success, among ourselves. Mr Twining, a considerable tea-dealer in London, published a pamphlet some years ago, in which he has exposed this infamous traffic. The information (he says) was obtained from a gentleman who had made very accurate inquiries into this subject.

The smouch for mixing with black teas is made of the leaves of the ash. When gathered, they are first dried in the sun, then baked: they are next put upon a floor, and trod upon until the leaves are small, then sifted and steeped in copperas with sheeps dung; after which, being dried on a floor, they are fit for use. There is also another mode: When the leaves are gathered, they are boiled in a copper with copperas and sheeps dung; when the liquor is strained off, they are baked and trod upon, until the leaves are small, after which they are fit for use. The quantity manufactured at a small village, and within eight or ten miles thereof, cannot be ascertained, but is supposed to be about 20 tons in a year. One man acknowledges to have made 600 weight in every week for six months together. The fine is sold at 41 4s. per cwt. equal to 9d. per lb. The coarse is sold at 21. 2s. per cwt. equal to 4½d. per lb. Elder buds are manufactured in some places to represent fine teas.

For the honour of human nature, we hope such a traffic as this is not very common; but if there be, those concerned in it deserve exemplary punishment. The only way (Mr Twining says) to escape this adulterated tea, is never to purchase from those who offer their teas to sale at lower prices than genuine teas can be afforded; but to purchase them only from persons of character.

Tea.
Teachers.

addition to its value; for whatever affords rational pleasure to the mind, will always contribute to bodily health.

In this country teas are generally divided into three kinds of green, and five of bohea: The former are, 1. Imperial or bloom tea, with a large loose leaf, light green colour, and a faint delicate smell. 2. Hyson, so called from the name of the merchant who first imported it; the leaves of which are closely curled and small, of a green colour, verging to a blue: And, 3. Singlo tea, from the name of the place where it is cultivated. The boheas are, 1. Sou-chong, which imparts a yellow green colour by infusion. 2. Cambo, so called from the place where it is made; a fragrant tea, with a violet smell; its infusion pale. 3. Congo, which has a larger leaf than the following, and its infusion somewhat deeper, resembling common bohea in the colour of the leaf. 4. Pekoe tea; this is known by the appearance of small white flowers mixed with it. 5. Common bohea, whose leaves are of one colour. There are other varieties, particularly a kind of green tea, done up in roundish balls, called *gunpowder tea*.

Tea-Tree of New Zealand, is a species of myrtle, of which an infusion was drunk by Captain Cook's people in their voyages round the world. Its leaves were finely aromatic, astringent, and had a particular pleasant flavour at the first infusion; but this went off at the next filling up of the tea pot, and a great degree of bitterness was then extracted; for which reason it was never suffered to be twice infused. In a fine soil in thick forests this tree grows to a considerable size; sometimes 30 or 40 feet in height, and one foot in diameter. On a hilly and dry exposure it degenerates into a shrub of five or six inches; but its usual size is about eight or ten feet high, and three inches in diameter. In that case its stem is irregular and unequal, dividing very soon into branches, which rise at acute angles, and only bear leaves and flowers at top. The flowers are white, and very ornamental to the whole plant.

Mr White, in his *Journal of a Voyage to New South Wales*, mentions a shrub which he calls a *tea-tree*, merely from its being used by the convicts as a *succedaneum* for tea; for he had not seen the flower, nor did he know to what genus it belonged. It is a creeping kind of a vine, running to a great extent along the ground; the stalk slender; the leaf not so large as the common bay leaf; the taste sweet, exactly like the liquorice root of the shops.

TEACHERS, persons employed in conducting the education of the young.

We will venture to say, that there is no class of men to whom a nation is so much indebted as to those employed in instructing the young: For if it be education that forms the only distinction between the civilized and the savage, much certainly is due to those who devote themselves to the office of instruction. It must be the duty therefore of every state to take care that proper encouragement be given to those who undertake this office. There ought to be such a salary as would render it an object of ambition to men of abilities and learning, or at least as would keep the teacher respectable. In Scotland, the office of a schoolmaster was formerly much more lucrative than at present, and most of that class had received liberal education; and this is the reason why the common people in Scotland have been famous, even to a proverb, for their learning. But at present the salary of a country schoolmaster, independent of fees for scholars, is not greater than a ploughman can earn, being seldom more than L. 8 : 6 : 8, the consequence of which is, that this, which is in fact an honourable, because an useful profession, is now sinking into contempt. It is no longer an

object to a man of learning; and we must soon be satisfied with schoolmasters that can read, write, and cast accounts, a little better than the lowest of the people, or who from some natural deformity are unable to exercise a trade. And what in this case must become of the minds of the common people? They must be totally uncultivated.

We have observed a great difference between the cultivation of the common people in one part of Scotland compared with another; and we have found, that wherever a schoolmaster is looked upon as a mean profession, there is scarcely a duly qualified person to be found to undertake the office; and in those places the common people are lamentably ignorant. In other places again, where the schoolmaster is considered as one of the principal persons in the parish, there men of a liberal education, young divines, and preachers, do not think themselves disgraced by exercising this profession; and there the common people show a degree of acuteness, knowledge, and observation, and possess such polished manners, as raise them very high above those of their own rank in other parts of the country.

Many and keen have been the debates about a reform of government of late years; but little attention has been paid to the formation of the minds of the common people, who constitute the greater part of the nation; of course they are ready to join the standard of every seditious demagogue who sounds the alarm of oppression; and should they at length be roused, their cruelty and barbarity, like the common people of France, would be exactly in proportion to their ignorance and want of principle.

We are willing to hope, then, that the government and the monied men of the nation, who alone have property to lose and money to bestow, will at length find it to be their interest to patronize schoolmasters.

TEAL, in ornithology. See *ANAS*.

TEARS, a lymph or aqueous humour, which is limpid, and a little saltish: it is separated from the arterial blood by the lachrymal glands and small glandulous grains on the inside of the eyelids.

TEASELS, a plant cultivated in the west of England for the use of clothiers. See *DIPSACUS*.

TEBETH, the tenth month of the Jewish ecclesiastical year, and fourth of the civil. It answers to our month of December.

TECKLENBURG, a town of Germany, in the circle of Westphalia, capital of a county of the same name, with a castle built on a hill. It was bought by the king of Prussia in 1707. E. Long. 8. 2. N. Lat. 52. 20.

TECHNICAL, expresses somewhat relating to arts or sciences: in this sense we say technical terms. It is also particularly applied to a kind of verses wherein are contained the rules or precepts of any art, thus digested to help the memory to retain them; an example whereof may be seen in the article *MEMORY*.

TECTONA, in botany; a genus of plants belonging to the class of *pentandria*, and order of *monogynia*. The stigma is dentate; the fruit a dry spongy plum within an inflated calyx; and the nucleus is trilobular. There is only one species, the *grandis*, Indian oak, or teak wood, which is a native of India.

TE DEUM, the name of a celebrated hymn, used in the Christian church, and so called because it begins with these words, *Te Deum laudamus*, We praise thee, O God. It is sung in the Romish church with great pomp and solemnity upon the gaining of a victory, or other happy event; and is believed to be the composition of St AMBROSE bishop of Milan.

TEES, a river which rises on the confines of Cumberland,

Tea-
||
Tees

land, and running eastward, divides the county of Durham from Yorkshire, and falls into the German sea below Stockton.

TEETH, the bones placed in the jaws for chewing food, that it may be the more easily digested in the stomach. The anatomical structure of these has already been described under **ANATOMY** and **COMPARATIVE ANATOMY**. The diseases to which they are liable, as well as the most successful remedies for removing them, are fully detailed under **MEDICINE** and **SURGERY**, to which we refer the reader.

Much attention has been paid to the beauty and preservation of the teeth among most nations. The Romans rubbed and washed them with great care; and when they lost them, supplied their place with artificial teeth made of ivory; and sometimes, when loose, bound them with gold. Ligatures of wire have been found to hurt the natural teeth with which the artificial are connected: whereas silken twist cannot affect them to any considerable degree for several years.

Gulleman gives us the composition of a paste for making artificial teeth, which shall never grow yellow: the composition is white wax granulated, and melted with a little gum elemi, adding powder of white musk, coral, and pearl.

When several teeth are out in the same place, it is best to make a set, or the number wanted, out of one piece, all adhering together, which may be fastened to the two next of the sound or natural teeth. And even a whole set of artificial teeth may be made for one or both jaws, so well fitted to admit of the necessary motions, and so conveniently retained in the proper situation by means of springs, that they will answer every purpose of natural teeth, and may be taken out, cleaned, and replaced, by the patient himself with great ease.

The common trick of mountebanks and other such practitioners, is to use various washes for teeth, the sudden effects of which, in cleaning and whitening the teeth, surprise and please people; but the effects are very pernicious. All the strong acid spirits will do this. As good a mixture as any thing can be, on this occasion, is the following: take plantane-water an ounce, honey of roses two drams, muriatic acid ten drops; mix the whole together, and rub the teeth with a piece of linen rag dipped in this every day till they are whitened. The mouth ought to be well washed with cold water after the use of this or any other acid liquor; and indeed the best of all teeth washes is cold water, with or without a little salt; the constant use of this will keep them clean and white, and prevent them from aching.

After all the numerous cures which have been proposed for preventing the toothach, we will venture to recommend the keeping the teeth clean as the most efficacious, and avoiding every kind of hot food, especially hot liquids, as tea, &c. They who are constantly using powders generally destroy their teeth altogether, as the valetudinarian docs his health.

TEETHING in children. See **MEDICINE**.

TEFF, a kind of grain, sown all over Abyssinia, from which is made the bread commonly used throughout the country. We have no description of this plant but from Mr Bruce, who says that it is herbaceous; and that from a number of weak leaves surrounding the root proceeds a stalk of about 28 inches in length, not perfectly straight, smooth, but jointed or knotted at particular distances. This stalk is not much thicker than that of a carnation or jellyflower. About eight inches from the top, a head is formed of a number of small branches, upon which it carries the fruit and flowers; the latter of which is small, of a crimson colour, and scarcely perceptible by the naked eye but from

the opposition of that colour. The pistil is divided into two, seemingly attached to the germ of the fruit, and has at each end small capillaments forming a brush. The stamina are three in number; two on the lower side of the pistil, and one on the upper. These are each of them crowned with two oval stigmata, at first green, but after crimson. The fruit is formed in a capsula, consisting of two conical hollow leaves, which, when closed, seems to compose a small conical pod, pointed at the top. The fruit or seed is oblong, and is not so large as the head of the smallest pin; yet it is very prolific, and produces these seeds in such quantity as to yield a very abundant crop in the quantity of meal.

Our author, from the similarity of the names, conjectures it to be the *typha* mentioned, but not described, by Pliny: but this conjecture, which he acknowledges to be unreported, is of very little importance.

There are three kinds of meal made from teff, of which the best (he says) is as white as flour, exceedingly light, and easily digested: the second is of a browner colour; and the last, which is the food of soldiers and servants, is nearly black. This variety he imagines to arise entirely from the difference of soils in which the seeds are sown, and the different degrees of moisture to which the plant is exposed when growing. The manner of making the meal or flour into bread is by taking a broad earthen jar, and having made a lump of it with water, they put it into an earthen jar at some distance from the fire, where it remains till it begins to ferment or turn sour; they then bake it into cakes of a circular form, and about two feet in diameter: it is of a spongy soft quality, and not a disagreeable sourish taste. Two of these cakes a-day, and a coarse cotton cloth once a-year, are the wages of a common servant.

At their banquets of raw meat, the flesh being cut in small bits, is wrapt up in pieces of this bread, with a proportion of fossil salt and Cayenne pepper. Before the company sits down to eat, a number of these cakes of different qualities are placed one upon the other, in the same manner as our plates, and the principal people sitting first down, eat the white teff; the second or coarser sort serves the second rate people that succeed them, and the third is for the servants. Every man, when he is done, dries or wipes his fingers upon the bread which he is to leave for his successor, for they have no towels; and this is one of the most beastly customs among them.

Of this teff bread the natives make a liquor, by a process which our author describes in the following words: The bread, when well toasted, is broken into small pieces, which are put into a large jar, and have warm water poured upon them. It is then set by the fire, and frequently stirred for several days, the mouth of the jar being close covered. After being allowed to settle three or four days, it acquires a sourish taste, and is what they call *bouza*, or the common beer of the country. The *bouza* in Atbara is made in the same manner, only instead of teff, cakes of barley-meal are employed. Both are very bad liquors, but the worst is that made of barley.

TEFFLIS, or **TIFFLIS**, a town of Asia, in Georgia, one of the seven nations between the Black Sea and the Caspian. It is the capital of that country, the place of residence of its sovereign, and is called by the inhabitants *Thiblis-Cabar*, "warm town," from the warm baths in its neighbourhood. Though its circumference does not exceed two English miles, it contains 20,000 inhabitants, of which more than half are Armenians; the remainder are principally Georgians, with some Tartars. According to Major Rennel, it has 20 Armenian and 15 Greek churches, and three methods. But Mr Coxe, on the authority of Professor

Teff,
Tefflis.

Tellis
Telegraph, h.

Guldenstaedt, states the places of worship to be one Roman Catholic, 13 Greek, and seven Armenian churches. There are some magnificent caravanseras, bazars, and palaces in the city, but no mosques; for the Georgians, though living under a Mohammedan government, have always risen up in arms as often as any attempts have been made to erect such places of Mohammedan worship. Many of the Romish missionaries live here in disguise under the denomination of physicians, surgeons, and chemists; and the great cures which they perform procure them much esteem, though they are sometimes exposed to the insults of the people when they attempt to make any proselytes to their church. All the Houses are of stone, with flat roofs, which serve, according to the custom of the East, as walks for the women. They are neatly built; the rooms are wainscotted, and the floors spread with carpets. The streets seldom exceed seven feet in breadth; and some are so narrow as scarcely to allow room for a man on horseback: they are consequently very filthy.

Tellis is a place of considerable trade, especially in furs, which are conveyed hence to Constantinople by the way of Erzerum. As for the silks of this country, they are bought up on the spot by the Armenians, and conveyed to Smyrna and other ports of the Mediterranean; but the greatest part is first sent to Erzerum to be manufactured, the Georgians being very ignorant and unskilful in that respect. From hence, likewise, great quantities of a root called *boya* is sent to Erzerum and Indostan for the use of the linen dyers. Here is likewise a foundery, at which are cast a few cannon, mortars, and balls, all of which are very inferior to those of the Turks. The gunpowder made here is very good. The Armenians have likewise established in this town all the manufactures carried on by their countrymen in Persia: the most flourishing is that of printed linens. Tellis is seated on the river Kur, at the foot of a mountain; and on the south side of it stands a large castle or fortress, built by the Turks in 1576, when they made themselves masters of the city and country, under the command of the famous Mustapha Pacha. It is 125 miles west of Terki. E. Long. 63. 3. N. Lat. 41. 59.

TEGERHY, a principal town in Fezzan, in Africa, about 80 miles south-west of the capital. It collects from its lands little other produce than dates and Indian corn. In this, as in every town in Fezzan, a market for butcher-meat, corn, fruit, and vegetables, is regularly held. Mutton and goats flesh are sold by the quarter without weighing; the usual price is from 32 to 40 grains of gold-dust, or four or five shillings English money. The flesh of the camel, which is much more highly valued, is commonly sold at a dearer rate, and is divided into smaller lots. Agriculture and pasturage seem to be the principal occupations.

TEGUMENT, any thing that surrounds or covers another.

TEIND in Scots law. See LAW, N^o clxx.

Commission of TEINDS. See COMMISSION.

TEIN'S, and SEMITEIN'S, in painting, denote the several colours used in a picture, considered as more or less high, bright, deep, thin, or weakened and diminished, &c. to give the proper relief, softness, or distance, &c. of the several objects.

TELEGRAPH (derived from *τῆλε* and *γραφειν*), is the name very properly given to an instrument, by means of which information may be almost instantaneously conveyed to a considerable distance.

The telegraph, though it has been generally known and used by the moderns only for a few years, is by no means a modern invention. There is reason to believe that amongst

the Greeks there was some sort of telegraph in use. The burning of Troy was certainly known in Greece very soon after it happened, and before any person had returned from thence. Now that was altogether so tedious a piece of business, that conjecture never could have supplied the place of information. A Greek play begins with a scene, in which a watchman descends from the top of a tower in Greece, and gives the information that Troy was taken. "I have been looking out these ten years (says he) to see when that would happen, and this night it is done." Of the antiquity of a mode of conveying intelligence quickly to a great distance, this is certainly a proof.

The Chinese, when they send couriers on the great canal, or when any great man travels there, make signals by fire from one day's journey to another, to have every thing prepared; and most of the barbarous nations used formerly to give the alarm of war by fires lighted on the hills or rising grounds.

Polybius calls the different instruments used by the ancients for communicating information *πυρραμα πυρρα*, because the signals were always made by means of fire. At first they communicated information of events merely by torches; but this method was of little use, because it was necessary before-hand to fix the meaning of every particular signal. Now as events are exceedingly various, it was impossible to express the greater number of them by any premeditated contrivance. It was easy, for instance, to express by signals that a fleet had arrived at such a place, because this had been foreseen, and signals accordingly had been agreed upon to denote it; but an unexpected revolt, a murder, and such accidents, as happen but too often, and require an immediate remedy, could not be communicated by such signals; because to foresee them was impossible.

Aeneas, a contemporary of Aristotle, who wrote a treatise on the duties of a general, endeavoured to correct those imperfections, but by no means succeeded. "Those (says he) who would give signals to one another upon affairs of importance, must first prepare two vessels of earth, exactly equal in breadth and depth; and they need be but four feet and a half deep, and a foot and a half wide. They then must take pieces of cork, proportioned to the mouth of these vessels, but not quite so wide, that they may be let down with ease to the bottom of these vessels. They next fix in the middle of this cork a stick, which must be of equal size in both these vessels. This stick must be divided exactly and distinctly, by spaces of three inches each, in order that such events as generally happen in war may be writ on them. For example, on one of these spaces the following words may be writ: 'A BODY OF HORSE ARE MARCHED INTO THE COUNTRY.' On another, 'A BODY OF INFANTRY, heavily armed, are arrived hither.' On a third, 'INFANTRY LIGHTLY ARMED.' On a fourth, 'HORSE AND FOOT.' On another, 'SHIPS,' then 'PROVISIONS;' and so on till all the events which may probably happen in the war that is carrying on are writ down in these intervals.

This being done, each of the two vessels must have a little tube or cock of equal bigness, to let out the water in equal proportion. Then the two vessels must be filled with water; the pieces of cork, with their sticks thrust through them, must be laid upon them, and the cocks must be opened. Now, it is plain, that as these vessels are equal, the corks will sink, and the sticks descend lower in the vessels, in proportion as they empty themselves. But to be more certain of this exactness, it will be proper to make the experiment first, and to examine whether all things correspond and agree together, by an uniform execution on both sides. When they are well assured of this, the two vessels must be carried to the two places where the signals are to be made

hand observed: water is poured in, and the corks and sticks are put in the vessels. When any of the events which are written on the sticks shall happen, a torch or other light is raised, which must be held aloft till such time as another is raised by the party to whom it is directed. (This first signal is only to give notice that both parties are ready and attentive). Then the torch or other light must be taken away, and the cocks set open. When the interval, that is, that part of the stick where the event of which notice is to be given or written, shall be fallen to a level with the vessels, then the man who gives the signal lifts up his torch; and on the other side, the correspondent signal-maker immediately turns the cock of his vessel, and looks at what is writ on that part of the stick which touches the mouth of the vessel: on which occasion, if every thing has been executed exactly and equally on both sides, both will read the same thing."

"This method was defective, because it could not convey any other intelligence except what was written on the sticks, and even that not particularly enough. With regard to all unforeseen events, it was quite useless.

A new method was invented by Cleoxenus (others say by Democlitus), and very much improved by Polybius, as he himself informs us. He describes this method as follows: Take the letters of the (Greek) alphabet, and divide them into five parts, each of which will consist of five letters, except the last division, which will have only four. Let these be fixed on a board in five columns. The man who is to give the signals is then to begin by holding up two torches, which he is to keep aloft till the other party has also shown two. This is only to show that both sides are ready. These first torches are then withdrawn. Both parties are provided with boards, on which the letters are disposed as formerly described. The person then who gives the signal is to hold up torches on the left to point out to the other party from what column he shall take the letters as they are pointed out to him. If it is to be from the first column, he holds up one torch; if from the second, two; and so on for the others. He is then to hold up torches on the right, to denote the particular letter of the column that is to be taken. All this must have been agreed on before-hand. The man who gives the signals must have an instrument (*συνισμα*), consisting of two tubes, and so placed as that, by looking through one of them, he can see only the right side, and through the other only the left, of him who is to answer. The board must be set up near this instrument; and the station on the right and left must be surrounded with a wall (*περιτειχισμα*) ten feet broad, and about the height of a man, that the torches raised above it may give a clear and strong light, and that when taken down they may be completely concealed. Let us now suppose that this organization is to be communicated—*A number of the auxiliaries, about a hundred, have gone over to the enemy.* In the first place, words must be chosen that will convey the information in the fewest letters possible; as, *A hundred Grecians have deserted,* *Κεντρικη αγωγη απο της ολιγαρχιας.* Having written down this sentence, it is conveyed in this manner. The first letter is a κ, which is in the second column; two torches are therefore to be raised on the left hand to inform the person who receives the signals to look into that particular column. Then five torches are to be held up on the right, to mark the letter κ, which is the last in the column. Then four torches are to be held up on the left to point out the ρ (*r*), which is in the fourth column, and two on the right to show that it is the second letter of that column. The other letters are pointed out in the same manner.—Such was the *psifia* or telegraph recommended by Polybius.

But neither this nor any other method mentioned by the ancients seems ever to have been brought into general use;

nor does it appear that the moderns had thought of such a *Telegraph* machine as a *telegraph* till the year 1663, when the Marquis of Worcester, in his *CENTURY OF INVENTIONS*, affirmed that he had discovered "a method by which, at a window, as far as eye can discover black from white, a man may hold discourse with his correspondent, without noise made or notice taken; being according to occasion given, or means afforded, *ex re nata*, and no need of provision before hand; though much better if foreseen, and course taken by mutual content of parties." This could be done only by means of a telegraph, which in the next sentence is declared to have been rendered so perfect, that by means of it the correspondence could be carried on "by night as well as by day, though as dark as pitch is black."

About 40 years afterwards M. Amontons proposed a new telegraph. His method was this: Let there be people placed in several stations, at such a distance from one another, that by the help of a telescope a man in one station may see a signal made in the next before him; he must immediately make the same signal, that it may be seen by persons in the station next after him, who are to communicate it to those in the following station, and so on. These signals may be as letters of the alphabet, or as a cipher, understood only by the two persons who are in the distant places, and not by those who make the signals. The person in the second station making the signal to the person in the third the very moment he sees it in the first, the news may be carried to the greatest distance in as little time as is necessary to make the signals in the first station. The distance of the several stations, which must be as few as possible, is measured by the reach of a telescope. Amontons tried this method in a small tract of land before several persons of the highest rank at the court of France.

It was not, however, till the French revolution that the telegraph was applied to useful purposes. Whether M. Chappe, who is said to have invented the telegraph first used by the French about the end of 1793, knew any thing of Amontons's invention or not, it is impossible to say; but his telegraph was constructed on principles nearly similar. The manner of using this telegraph was as follows: At the first station, which was on the roof of the palace of the Louvre at Paris, M. Chappe, the inventor, received in writing, from the committee of public welfare, the words to be sent to Lille, near which the French army at that time was. An upright post was erected on the Louvre, at the top of which were two transverse arms, moveable in all directions by a single piece of mechanism, and with inconceivable rapidity. He invented a number of positions for these arms, which stood as signs for the letters of the alphabet; and these, for the greater celerity and simplicity, he reduced in number as much as possible. The grammarian will easily conceive that sixteen signs may amply supply all the letters of the alphabet, since some letters may be omitted not only without detriment but with advantage. These signs, as they were arbitrary, could be changed every week; so that the sign of B for one day might be the sign of M the next; and it was only necessary that the persons at the extremities should know the key. The intermediate operators were only instructed generally in these sixteen signals; which were so distinct, so marked, so different the one from the other, that they were easily remembered. The construction of the machine was such, that each signal was uniformly given in precisely the same manner at all times: It did not depend on the operator's manual skill; and the position of the arm could never, for any one signal, be a degree higher or a degree lower, its movement being regulated mechanically.

M. Chappe having received at the Louvre the sentence

Telegraph. to be conveyed, gave a known signal to the second station, which was Mont Martre, to prepare. At each station there was a watch tower, where telescopes were fixed, and the person on watch gave the signal of preparation which he had received, and this communicated successively through all the line, which brought them all into a state of readiness. The person at Mont Martre then received, letter by letter, the sentence from the Louvre, which he repeated with his own machine; and this was again repeated from the next height, with inconceivable rapidity, to the final station at Lille.

*English
Review,
June 1796.*

The first description of the telegraph was brought from Paris to Frankfort on the Maine by a former member of the parliament of Bourdeaux, who had seen that which was erected on the mountain of Belleville. As given by Dr Hutton from some of the English papers, it is as follows. AA is a beam or mast of wood placed upright on a rising ground (fig. 1. Plate DII.), which is about 15 or 16 feet high. BB is a beam or balance moving upon the centre AA. This balance-beam may be placed vertically or horizontally, or any how inclined, by means of strong cords, which are fixed to the wheel D, on the edge of which is a double groove to receive the two cords. This balance is about 11 or 12 feet long, and nine inches broad, having at the ends two pieces of wood CC, which likewise turn upon angles by means of four other cords that pass through the axis of the main balance, otherwise the balance would derange the cords; the pieces C are each about three feet long, and may be placed either to the right or left, straight or square, with the balance-beam. By means of these three the combination of movement is very extensive, remarkably simple, and easy to perform. Below is a small wooden gouge or hut, in which a person is employed to observe the movements of the machine. In the mountain nearest to this another person is to repeat these movements, and a third to write them down. The time taken up for each movement is 20 seconds; of which the motion alone is four seconds, the other 16 the machine is stationary. Two working models of this instrument were executed at Frankfort, and sent by Mr W. Playfair to the Duke of York; and hence the plan and alphabet of the machine came to England.

Various experiments were in consequence tried upon telegraphs in this country; and one was soon after let up by government in a chain of stations from the admiralty-office to the sea coast. It consists of six octagon boards, each of which is poised upon an axis in a frame, in such a manner that it can be either placed vertically, so as to appear with its full size to the observer at the nearest station, as in fig. 2. or it becomes invisible to him by being placed horizontally, as in fig. 3. so that the narrow edge alone is exposed, which narrow edge is from a distance invisible. Fig. 2. is a representation of this telegraph, with the parts all shut, and the machine ready to work. T, in the officer's cabin, is the telescope pointed to the next station. Fig. 3. is a representation of the machine not at work, and with the poits all open. The opening of the first port (fig. 2.) expresses a, the second b, the third c, the fourth d, the fifth e, and the sixth f, &c.

Six boards make 36 changes, by the most plain and simple mode of working; and they will make many more if more were necessary; but as the real superiority of the telegraph over all other modes of making signals consists in its making letters, we do not think that more changes than the letters of the alphabet, and the ten arithmetical ciphers, are necessary; but, on the contrary, that those who work the telegraphs should avoid communicating by words or signs agreed upon to express sentences; for that is the sure method never to become expert at sending unexpected intelligence accurately.

This telegraph is without doubt made up of the best number of combinations possible; five boards would be insufficient, and seven would be useless. It has been objected to it, however, that its form is too clumsy to admit of its being raised to any considerable height above the building on which it stands; and that it cannot be made to change its direction, and consequently cannot be seen but from one particular point.

Several other telegraphs have been proposed to remedy these defects, and perhaps others to which the instrument is still liable. The dial-plate of a clock would make an excellent telegraph, as it might exhibit 144 signs so as to be visible at a great distance. A telegraph on this principle, with only six divisions instead of twelve, would be simple and cheap, and might be raised 20 or 30 feet high above the building without any difficulty: it might be supported on one post, and therefore turn round, and the contrast of colours would always be the same.

A very ingenious improvement of the telegraph has been proposed in the Gentleman's Magazine. It consists of a semicircle, to be properly elevated, and fixed perpendicularly on a strong stand. The radius 12 feet; the semicircle consequently somewhat more than 36. This to be divided into 24 parts. Each of these will therefore comprise a space of 18 inches, and an arch of $7^{\circ} 30'$ on the circumference. These 24 divisions to be occupied by as many circular apertures of six inches diameter; which will leave a clear space of six inches on each side between the apertures. These apertures, beginning from the left, to denote the letters of the alphabet, omitting K, J consonant, V, X, and Q, as useless for this purpose. There are then 21 letters. The four other spaces are reserved for signals. The instrument to have an index moveable by a windlass on the centre of the semicircle, and having two tops, according as it is to be used in the day or night; one, a circular top of lacquered iron or copper, of equal diameter with the apertures (and which consequently will eclipse any of them against which it rests); the other, a spear or arrow-shaped top, black, and highly polished, which, in standing before any of the apertures in the day-time, will be distinctly visible. In the night, the apertures to be reduced by a diaphragm sitting close to each, so as to leave an aperture of not more than two inches diameter. The diaphragm to be of well-polished tin; the inner rim lacquered black half an inch. All the apertures to be illuminated, when the instrument is used in the night-time, by small lamps; to which, if necessary, according to circumstances, convex lenses may be added, fitted into each diaphragm, by which the light may be powerfully concentrated and increased. Over each aperture one of the five prismatic colours least likely to be mistaken (the remaining two being less distinguishable, and not wanted, are best omitted) to be painted; and, in their natural order, on a width of eighteen inches and a depth of four, red, orange, yellow, green, blue; or, still to heighten the contrast, and render immediately successive apertures more distinguishable, red, green, orange, blue, yellow. The whole inner circle beneath and between the apertures to be painted black.

When the instrument is to be used, the index to be set to the signal apertures on the right. All the apertures to be covered or dark when it begins to be used, except that which is to give the signal. A signal gun to be fired to apprise the observer. If the index is set to the first aperture, it will denote that words are to be expressed; if to the second, that figures; if to the third, that the figures cease; and that the intelligence is carried on in words. When figures are to be expressed, the alternate apertures from the left are taken in their order, to denote from 1 to 10 inclusively;

ly; the second from the right denotes 100; the fifth 1000. This order, and these intervals, are taken to prevent any confusion in so peculiarly important an article of the intelligence to be conveyed.

Perhaps, however, none of the telegraphs hitherto offered to the public exceeds the following, either in simplicity, cheapness, or facility in working, and it might perhaps, with a few trifling additions, be made exceedingly distinct. It is thus described in the Repertory of Arts and Manufactures: For a nocturnal telegraph, let there be four large patent reflectors, lying on the same plane, parallel to the horizon, placed on the top of an observatory. Let each of these reflectors be capable, by means of two winches, either of elevation or depression to a certain degree. By elevating or depressing one or two of the reflectors, eighteen very distinct arrangements may be produced, as the following scheme will explain (A).

A	B	D	E	F	G
○	○	○	○	○	○
○○○	○ ○○	○○ ○	○○○	○○○	○ ○○

I	K	L	M	N	O
○○ ○	○○○	○○	○ ○	○ ○	○○
○	○	○○	○ ○	○○	○○

P	R	S	T	U	Y
○ ○	○○	○○	○	○ ○	○
○ ○	○ ○	○ ○	○○	○○	○○

For the sake of example, the above arrangements are made to answer to the most necessary letters of the alphabet; but alterations may be made at will, and a greater number of changes produced, without any addition to the reflectors. In the first observatory there need only be a set of single reflectors; but in the others each reflector should be double, so as to face both the preceding and subsequent observatory; and each observatory should be furnished with two telescopes. The proper diameter of the reflectors, and their distance from each other, will be ascertained by experience.

To convert this machine into a diurnal telegraph, nothing more is necessary than to insert, in the place of the reflectors, gilt balls, or any other conspicuous bodies.

Were telegraphs brought to so great a degree of perfection, that they could convey information speedily and distinctly; were they so much simplified, that they could be constructed and maintained at little expence—the advantages which would result from their use are almost inconceivable. Not to speak of the speed with which information could be communicated and orders given in time of war, by means of which misfortunes might be prevented or instantly repaired, difficulties removed, and disputes precluded, and by means of which the whole kingdom could be prepared in an instant to oppose an invading enemy; it might be used by commercial men to convey a commission cheaper and speedier than an express can travel. The capitals of distant nations might be united by chains of posts,

VOL. XVIII. Part I.

and the settling of those disputes which at present take up months or years might then be accomplished in as many hours. An establishment of telegraphs might then be made like that of the post; and instead of being an expence, it would produce a revenue. Until telegraphs are employed to convey information that occurs very frequently, the persons who are stationed to work them will never become expert, and consequently will neither be expeditious nor accurate, though, with practice, there is no doubt but they will attain both in a degree of perfection of which we can as yet have but little conception.

TELEMACHUS, the son of Ulysses and Penelope, was still in the cradle when his father went with the rest of the Greeks to the Trojan war. At the end of this celebrated war, Telemachus, anxious to see his father, went to seek him; and as the place of his residence, and the cause of his long absence, were then unknown, he visited the court of Menelaus and Nestor to obtain information. He afterwards returned to Ithaca, where the suitors of his mother Penelope had conspired to murder him, but he avoided their snares; and by means of Minerva he discovered his father, who had arrived in the island two days before him, and was then in the house of Eumæus. With this faithful servant and Ulysses Telemachus concerted how to deliver his mother from the importunities of her suitors, and it was effected with great success. After the death of his father, Telemachus went to the island of *Ææa*, where he married Circe, or, according to others, Cassiphone the daughter of Circe, by whom he had a son called *Latinus*. He some time after had the misfortune to kill his mother-in-law Circe, and fled to Italy, where he founded Clusium. Telemachus was accompanied in his visit to Nestor and Menelaus by the goddess of wisdom under the form of Mentor. It is said that, when a child, Telemachus fell into the sea, and that a dolphin brought him safe to shore, after he had remained some time under water. From this circumstance Ulysses had the figure of a dolphin engraved on the seal which he wore on his ring.

From these stories, collected from Homer and the other poets of antiquity, the celebrated Fenelon archbishop of Cambrai took the idea of his well-known *Adventures of Telemachus*; which, though not composed in verse, is justly intitled to be esteemed a poem. "The plan of the work (says Dr Blair) is in general well contrived; and is deficient neither in epic grandeur nor unity of object. The author has entered with much felicity into the spirit and ideas of the ancient poets, particularly into the ancient mythology, which retains more dignity, and makes a better figure in his hands than in those of any other modern poet. His descriptions are rich and beautiful; especially of the softer and calmer scenes, for which the genius of Fenelon was best suited; such as the incidents of pastoral life, the pleasures of virtue, or a country flourishing in peace. There is an inimitable sweetness and tenderness in several of the pictures of this kind which he has given;" and his measured prose, which is remarkably harmonious, gives the style nearly as much elevation as the French language is capable of supporting even in regular verse.

According to the same eminent critic, "the best executed part of the work is the first six books, in which Telemachus recounts his adventures to Calypso. The narration throughout them is lively and interesting. Afterwards, especially in the last twelve books, it becomes more tedious and languid; and in the warlike adventures which are attempted,

Telegraph,
Telemachus.

Lectures on
Rhetoric and
the Rules
of Letters.

(A) Each reflector, after every arrangement, must be restored to its place.

Te'lepi'um, tempted, there is a great defect of vigour. The chief objection against this work being classed with epic poems, arises from the minute details of virtuous policy, into which the author in some places enters; and from the discourses and instructions of Mentor, which recur upon us too often, and too much in the strain of common-place morality. Though these were well suited to the main design of the author, which was to form the mind of a young prince, yet they seem not congruous to the nature of epic poetry; the object of which is to improve us by means of actions, characters, and sentiments, rather than by delivering professed and formal instruction."

TELEPHIUM, TRUE ORPINE, in botany: A genus of plants belonging to the class of *pentandria*, and order of *trigynia*; and in the natural system ranging under the 54th order, *Miscellanea*. The calyx is pentaphyllous; there are five petals, which are inserted into the receptacle; the capsule is unilocular and trivalvular. There are two species, the *imperati* and *oppositifolia*.

TELESCOPE, an optical instrument for viewing distant objects; so named by compounding the Greek words *tele* far off, and *skopein* to look at or contemplate. This name is commonly appropriated to the larger sizes of the instrument, while the smaller are called PERSPECTIVE-GLASSES, SPY-GLASSES, OPERA-GLASSES. A particular kind, which is thought to be much brighter than the rest, is called a NIGHT GLASS.

To what has been said already with respect to the inventor of this most noble and useful instrument in the article OPTICS, we may add the two following claims.

Mr Leonhard Digges, a gentleman of the last century of great and various knowledge, positively asserts in his *Stratagemas*, and in another work, that his father, a military gentleman, had an instrument which he used in the field, by which he could bring distant objects near, and could know a man at the distance of three miles. He says, that when his father was at home he had often looked through it, and could distinguish the waving of the trees on the opposite side of the Severn. Mr Digges resided in the neighbourhood of Bristol.

Francis Fontana, in his *Celestial Observations*, published at Naples in 1646, says, that he was assured by a Mr Hardy, advocate of the parliament of Paris, a person of great learning and undoubted integrity, that on the death of his father, there was found among his things an old tube, by which distant objects were distinctly seen; and that it was of a date long prior to the telescope lately invented, and had been kept by him as a secret.

It is not at all improbable, that curious people, handling spectacle glasses, of which there were by this time great varieties, both convex and concave, and amusing themselves with their magnifying power and the singular effects which they produced in the appearances of things, might sometimes chance so to place them as to produce distinct and enlarged vision. We know perfectly, from the table and scheme which Sirturus has given us of the tools or dishes in which the spectacle-makers fashioned their glasses, that they had convex lenses formed to spheres of 24 inches diameter, and of 11 inferior sizes. He has given us a scheme of a set which he got leave to measure belonging to a spectacle-maker of the name of *Rogette* at Corunna in Spain; and he says that this man had tools of the same sizes for concave glasses. It also appears, that it was a general practice (of which we do not know the precise purpose) to use a convex and concave glass together. If any person should chance to put together a 24-inch convex and a 12-inch concave (wrought on both sides) at the distance of 6 inches, he

would have distinct vision, and the object would appear of double size. Concaves of 6 inches were not uncommon, and one such combined with the convex of 24, at the distance of 9 inches, would have distinct vision, and objects would be quadrupled in diameter. When such a thing occurred, it was natural to keep it as a curiosity, although the rationale of its operation was not in the least understood. We doubt not but that this happened much oftener than in these two instances. The chief wonder is, that it was not frequent, and taken notice of by some writer. It is pretty plain that Galileo's first telescope was of this kind, made up of such spectacle-glasses as he could procure; for it magnified only three times in diameter: a thing easily procured by such glasses as he could find with every spectacle-maker. And he could not but observe, in his trials of their glasses, that the deeper concaves and flatter convexes he employed, he produced the greater amplification; and then he would find himself obliged to provide a tool not used by the spectacle-makers, viz. either a much flatter tool for a convex surface, or a much smaller sphere for a concave: and, notwithstanding his telling us that it was by reflecting on the nature of refraction, and without any instruction, we are persuaded that he proceeded in this very way. His next telescope magnified but five times. Now the slightest acquaintance with the obvious laws of refraction would have directed him at once to a very small and deep concave, which would have been much easier made, and have magnified more. But he groped his way with such spectacle-glasses as he could get, till he at last made tools for very flat object-glasses and very deep eye-glasses, and produced a telescope which magnified about 25 times. Sirturus saw it, and took the measures of it. He afterwards saw a scheme of it which Galileo had sent to a German prince at Inspruch, who had it drawn (that is, the circles for the tools) on a table in his gallery. The object-glass was a plano-convex, a portion of a sphere, of 24 inches diameter; the eye-glass was a double concave of 2 inches diameter: the focal distances were therefore 24 inches and 1 inch nearly. This must have been a very lucky operation, for Sirturus says it was the best telescope he had seen; and we know that it requires the very best work to produce this magnifying power with such small spheres. Telescopes continued to be made in this way for many years; and Galileo, though keenly engaged in the observation of Jupiter's satellites, being candidate for the prize held out by the Dutch for the discovery of the longitude, and therefore much interested in the advantage which a convex eye-glass would have given him, never made them of any other form. Kepler published his *Dioptrics* in 1611: in which he tells us, all that he or others had discovered of the law of refraction, viz. that in very small obliquities of incidence, the angle of refraction was nearly $\frac{2}{3}$ of the angle of incidence. This was indeed enough to have pointed out, with sufficient exactness, the construction of every optical instrument that we are even now possessed of; for this proportionality of the angles of incidence and refraction is assumed in the construction of the optical figure for all of them; and the deviation from it is still considered as the *refinement* of the art, and was not brought to any rule till 50 years after by Huyghens, and called by him ABERRATION. Yet even the sagacious Kepler seems not to have seen the advantage of any other construction of the telescope; he just seems to acknowledge the possibility of it: and we are surpris'd to see writers giving him as the author of the astronomical telescope, or even as hinting at its construction. It is true, in the last proposition he shows how a telescope may be made apparently with a convex eye-glass; but this is only a frivolous

ope. fancy; for the eye-glass is directed to be made convex externally, and a very deep concave on the inside; so that it is, in fact, a meniscus with the concavity prevalent. In the 86th proposition, he indeed shows that it is possible so to place a convex glass behind another convex glass, that an eye shall see objects distinct, magnified, and inverted; and he speaks very sagaciously on the subject. After having said that an eye placed behind the point of union of the first glass will see an object inverted, he shows that a small part only will be seen; and then he shows that a convex glass, duly proportioned and properly placed, will show more of it. But in showing this, he speaks in a way which shows evidently that he had formed no distinct notions of the manner in which this effect would be produced, only saying vaguely that the convergency of the second glass would counteract the divergency beyond the focus of the first. Had he conceived the matter with any tolerable distinctness, after seeing the great advantage of taking in a field greater in almost any proportion, he would have eagerly caught at the thought, and enlarged on the immense improvement. Had he but drawn one figure of the progress of the rays through two convex glasses, such as fig. 12. of Pl. CCCLXIV. the whole would have been open to his view.

This step, so easy and so important, was reserved for Father Scheiner, as has been already observed in the article OPTICS; and the construction of this author, together with that of Jansen, are the models on which all refracting telescopes are now constructed; and in all that relates to their magnifying power, brightness, and field of vision, they may be constructed on Kepler's principle, that the angles of refraction are in a certain given proportion to the angles of incidence.

But after Huyghens had applied his elegant geometry to the discovery of Snellius, viz. the proportionality, not of the angles, but of the sines, and had ascertained the aberrations from the foci of infinitely slender pencils, the reasons were clearly pointed out why there were such narrow limits affixed by nature to the performance of optical instruments, in consequence of the indistinctness of vision which resulted from constructions where the magnifying power, the quantity of light, or the field of vision, were extended beyond certain moderate bounds. The theory of aberrations, which that most excellent geometer established, has enabled us to diminish this indistinctness arising from any of these causes; and this diminution is the sole aim of all the different constructions which have been contrived since the days of Galileo and Scheiner.

THE description which has been already given of the various constructions of telescopes in the article OPTICS, is sufficient for instructing the reader in the general principles of their construction, and with moderate attention will show the manner in which the rays of light proceed, in order to ensure the different circumstances of amplification, brightness, and extent of field, and even distinctness of vision, in as far as this depends on the proper intervals between the glasses. But it is insufficient for giving us a knowledge of the improvements which are aimed at in the different departures from the original constructions of Galileo and Scheiner, the advantage of the double eye-glass of Huyghens, and the quintuple eye-glass of Dollond: still more is it insufficient for showing us why the highest degrees of amplification and most extensive field cannot be obtained by the mere proportion of the focal distances of the glasses, as Kepler had taught. In short, without the Huyghenian doctrine of aberrations, neither can the curious reader learn the limits of their performance, nor the artist learn why one telescope is better than another, or in what manner to proceed to make a te-

lescope differing in any particular from those which he sees. Teles. ope.

Although all the improvements in the construction of telescopes since the publication of Huyghens's Dioptrics have been the productions of this island, and although Dr Smith of Cambridge has given the most elegant and perspicuous account of this science that has yet appeared, we do not recollect a performance in the English language (except the Optics of Emerson) which will carry the reader beyond the mere schoolboy elements of the science, or enable a person of mathematical skill to understand or improve the construction of optical instruments. The last work on this subject of any extent (Dr Priestley's History of Vision) is merely a parlour book for the amusement of half-taught dilettanti, but is totally deficient in the mathematical part, although it is here that the science of optics has her chief claim to pre-eminence, and to the name of a DISCIPLINA ACCURATA. But this would have been *ultra crepidam*; and the author would in all probability have made as poor a figure here as he has done in his attempts to degrade his species in his Commentaries on the *Vibratiuncula* of Hartley; motions which neither the author nor his amplifier were able to understand or explain. We trust that our readers, jealous as we are of every thing that sinks us in the scale of nature's works, will pardon this transient ejaculation of spleen, when our thoughts are called to a system which, of *absolute and unavoidable necessity*, makes the DIVINE MIND nothing but a quivering of *that matter* of which it is the AUTHOR and unerring DIRECTOR. *Sed missum faciamus.*

We think therefore that we shall do the public some service, by giving such an account of this *higher branch* of optical science as will at least tend to the complete understanding of this noble instrument, by which our conceptions of the extent of almighty power, and wisdom, and beneficence, are so wonderfully enlarged. In the prosecution of this we hope that many general rules will emerge, by which artists who are not mathematicians may be enabled to construct optical instruments with intelligence, and avoid the many blunders and defects which result from mere servile imitation.

The general aim in the construction of a telescope is, to form, by means of mirrors or lenses, an image of the distant object, as large, as bright, and as extensive as is possible, consistently with distinctness; and then to view the image with a magnifying glass in any convenient manner. This gives us an arrangement of our subject. We shall first show the principles of construction of the object-glass or mirror, so as that it shall form an image of the distant object with these qualities; and then show how to construct the magnifying glass or eye-piece, so as to preserve them unimpaired.

This indistinctness which we wish to avoid arises from two causes; the spherical figures of the refracting and reflecting surfaces, and the different refrangibility of the differently coloured rays of light. The first may be called the SPHERICAL and the second the CHROMATIC indistinctness; and the deviations from the foci, determined by the elementary theorem (OPTICS, p. 289.), may be called the SPHERICAL and the CHROMATIC aberrations.

The limits of a Work like this will not permit us to give any more of the doctrine of aberrations than is absolutely necessary for the construction of achromatic telescopes; and we must refer the reader for a general view of the whole to Euler's *Dioptrics*, and other works of that kind. Dr Smith has given as much as was necessary for the comparison of the merits of different glasses of similar construction, and this in a very plain and elegant manner.

We shall begin with the aberration of colour, because it is the most simple.

Telescope.

Plate
DII.

Let white or compounded light fall perpendicularly on the flat side PQ (fig. 1.) of a plano-convex lens PVQ, whose axis is CV and vertex V. The white ray ρP falling on the extremity of the lens is dispersed by refraction at the point P of the spherical surface, and the red ray goes to the point r of the axis, and the violet ray to the point v . In like manner the white ray qQ is dispersed by refraction at Q, the red ray going to r , and the violet to v . The red ray Pr crosses the violet ray Qv in a point D, and Qr crosses Pv in a point E; and the whole light refracted and dispersed by the circumference, whose diameter is PQ, passes through the circular area, whose diameter is DE. Supposing that the lens is of such a form that it would collect red rays, refracted by its whole surface in the point r , and violet in the point v ; then it is evident that the whole light which occupies the surface of the lens will pass through this little circle, whose diameter is DE. Therefore white light issuing from a point so distant that the rays may be considered as parallel, will not be collected in another point or focus, but will be dispersed over the surface of that little circle; which is therefore called the *circle of chromatic dispersion*; and the radiant point will be represented by this circle. The neighbouring points are in like manner represented by circles; and these circles encroaching on and mixing with each other, must occasion haziness or confusion, and render the picture indistinct. This indistinctness will be greater in the proportion of the number of circles which are in this manner mixed together. This will be in the proportion of the room that is for them; that is, in proportion to the area of the circle, or in the duplicate proportion of its diameter. Our first business therefore is, to obtain measures of this diameter, and to mark the connection between it and the aperture and focal distance of the lens.

Let i be to r as the sine of incidence in glass to the sine of refraction of the red rays; and let i be to v as the sine of incidence to the sine of refraction of the violet rays. Then we say, that when the aperture PQ is moderate, $v-r : v+r :: 2i = DE : PQ$, very nearly. For let DE, which is evidently perpendicular to Vr, meet the parallel incident rays in K and L and the radii of the spherical surface in G and H. It is plain that GPK is equal to the angle of incidence on the posterior or spherical surface of the lens; and GPr and GPv are the angles of refraction of the red and the violet rays; and that GK, GD, and GE, are very nearly as the sines of those angles, because the angles are supposed to be small. We may therefore institute this proportion $DE : KD = v-r : r-i$; then, by doubling the consequents $DE : 2KD = v-r : 2r-2i$. Also $DE : 2KD + DE = v-r : 2r-2i+v-r = v-r : r+v-2i$. But $2KD + DE$ is equal to KL or PQ. Therefore we have $DE : PQ = v-r : r+v-2i$. Q. E. D.

Cor. 1. Sir Isaac Newton, by most accurate observation, found, that in common glass the sines of refraction of the red and violet rays were 77 and 78 where the sine of incidence was 50. Hence it follows, that $v-r$ is to $v+r-2i$ as 1 to 55; and that the diameter of the smallest circle of dispersion is $\frac{1}{55}$ th part of that of the lens.

2. In like manner may be determined the circle of dispersion that will comprehend the rays of any particular colour or set of colours. Thus all the orange and yellow will pass through a circle whose diameter is $\frac{1}{80}$ th of that of the lens.

3. In different surfaces, or plano-convex lenses, the angles of aberration rPv are as the breadth PQ directly, and as the focal distance VF inversely; because any angle DPE is as its subtense DE directly and radius DP inversely. N. B. we call VF the focal distance, because at this distance, or at the point F, the light is most of all conspicated. If we examine the focal distance by holding the lens to the

sun, we judge it to be where the light is drawn into the smallest spot.

When we reflect that a lens of $\frac{5}{8}$ inches in diameter has a circle of dispersion $\frac{1}{55}$ th of an inch in diameter, we are surprised that it produces any picture of an object that can be distinguished. We should not expect greater distinctness from such a lens than would be produced in a camera obscura without a lens, by simply admitting the light through a hole of $\frac{1}{55}$ th of an inch in diameter. This, we know, would be very hazy and confused. But when we remark the superior vivacity of the yellow and orange light in comparison with the rest, we may believe that the effect produced by the confusion of the other colours will be much less sensible. But a stronger reason is, that the light is much denser in the middle of the circle of dispersion, and is exceedingly faint towards the margin. This, however, must not be taken for granted; and we must know distinctly the manner in which the light of different colours is distributed over the circle of chromatic dispersion, before we pretend to pronounce on the immense difference between the indistinctness arising from colour and that arising from the spherical figure. We think this the more necessary, because the illustrious discoverer of the chromatic aberration has made a great mistake in the comparison, because he did not consider the distribution of the light in the circle of spherical dispersion. It is therefore proper to investigate the chromatic distribution of the light with the same care that we bestowed on the spherical dispersion in OPTICS, n^o 251. &c.; and we shall then see that the superiority of the reflecting telescope is incomparably less than Newton imagined it to be.

Therefore let EB (fig. 2.) represent a plano-convex lens, of which C is the centre and Cr the axis. Let us suppose it to have no spherical aberration, but to collect rays occupying its whole surface to single points in the axis. Let a beam of white or compounded light fall perpendicularly on its plane surface. The rays will be so refracted by its curved surface, that the extreme red rays will be collected at r , the extreme violet rays at w , and those of intermediate refrangibility at intermediate points, o, y, g, b, p, v , of the line rw , which is nearly $\frac{1}{55}$ th of rC . The extreme red and violet rays will cross each other at A and D; and AD will be a section or diameter of the circle of chromatic dispersion, and will be about $\frac{1}{55}$ th of EB. We may suppose wr to be bisected in b , because wb is to br very nearly in the ratio of equality (for $rb : rC = bA : cE = bA : cB = wb : wC$). The line rw will be a kind of prismatic spectrum, red from r to o , orange-coloured from o to y , yellow from y to g , green from g to b , blue from b to p , purple from p to v , and violet from v to w .

The light in its compound state must be supposed uniformly dense as it falls upon the lens; and the same must be said of the rays of any particular colour. Newton supposes also, that when a white ray, such as eE , is dispersed into its component coloured rays by refraction at E, it is uniformly spread over the angle DEA. This supposition is indeed gratuitous; but we have no argument to the contrary, and may therefore consider it as just. The consequence is, that each point w, v, p, b , &c. of the spectrum is not only equally luminous, but also illuminates uniformly its corresponding portion of AD: that is to say, the coating (so to term it) of any particular colour, such as purple, from the point p , is uniformly dense in every part of AD on which it falls. In like manner, the colouring of yellow, intercepted by a part of AD in its passage to the point y , is uniformly dense in all its parts. But the density of the different colours in AD is extremely different: for since the radiation in w is equally dense with that in p , the density of the violet colouring, which radiates from w , and is spread

spread over the whole of AD, must be much less than the density of the purple colouring, which radiates from *p*, and occupies only a part of AD round the circle *b*. These densities must be very nearly in the inverse proportion of cb^2 to pb^2 .

Hence we see, that the central point *b* will be very intensely illuminated by the blue radiating from *p b* and the green intercepted from *bg*. It will be more faintly illuminated by the purple radiating from *vp*, and the yellow intercepted from *gy*; and still more faintly by the violet from *wv*, and the orange and red intercepted from *yr*. The whole colouring will be a white, tending a little to yellowness. The accurate proportion of these colourings may be computed from our knowledge of the position of the points *o, y, g, &c.* But this is of little moment. It is of more consequence to be able to determine the proportion of the total intensity of the light in *b* to its intensity in any other point I.

For this purpose draw *r IR, I w W*, meeting the lens in R and W. The point I receives none of the light which passes through the space RW: for it is evident that $bI : CR = bA : CE, = 1 : 55$, and that $CR = CW$; and therefore, since all the light incident on EB passes through AB, all the light incident on RW passes through I (*bi* being made = *bI*). Draw *o IO, y IY, g IG, I p P, I v V*. It is plain, that I receives red light from RO, orange from OY, yellow from YG, green from GE, a little blue from BP, purple from PV, and violet from VW. It therefore wants some of the green and of the blue.

That we may judge of the intensity of these colours at I, suppose the lens covered with paper pierced with a small hole at G. The green light only will pass through I; the other colours will pass between I and *b*, or between I and A, according as they are more or less refrangible than the particular green at I. This particular colour converges to *g*, and therefore will illuminate a small spot round I, where it will be as much denser than it is at G as this spot is smaller than the hole at G. The natural density at G, therefore, will be to the increased density at I, as gI^2 to gG^2 , or as gb^2 to gC^2 , or as bI^2 to CG^2 . In like manner, the natural density of the purple coming to I through an equal hole at P will be to the increased density at I as bI^2 to CP^2 . And thus it appears, that the intensity of the differently coloured illuminations of any point of the circle of dispersion, is inversely proportional to the square of the distance from the centre of the lens to the point of its surface through which the colouring light comes to this point of the circle of dispersion. This circumstance will give us a very easy, and, we think, an elegant solution of the question.

Bisect CE in F, and draw FL perpendicular to CE, making it equal to CF. Through the point L describe the hyperbola KLN of the second order, that is, having the ordinates EK, FL, RN, &c. inversely proportional to the squares of the abscissæ CE, CF, CR, &c.; so that $FL : RN =$

$$\frac{I}{CF^2} : \frac{I}{CR^2}, \text{ or } = CR^2 : CF^2, \text{ \&c.}$$

It is evident that these ordinates are proportional to the densities of the severally coloured lights which go from them to any points whatever of the circle of dispersion.

Now the total density of the light at I depends both on the density of each particular colour and on the number of colours which fall on it. The ordinates of this hyperbola determine the first; and the space ER measures the number of colours which fall on I, because it receives light from the whole of ER, and of its equal BW. Therefore, if ordinates be drawn from any point of ER, their sum will be as the whole light which goes to I; that is, the total density of the light at I will be proportional to the area NREK.

Now it is known that $CE \times EK$ is equal to the infinitely extended area lying beyond EK; and $CR \times RN$ is equal to the infinitely extended area lying beyond RN. Therefore the area NREK is equal to $CR \times RN - CE \times EK$. But

$$RN \text{ and } EK \text{ are respectively equal to } \frac{CF^2}{CR^2} \text{ and } \frac{CF^2}{CE^2}.$$

Therefore the density at I is proportional to $CF^2 \times \left(\frac{CR}{CR^2} - \frac{CE}{CE^2} \right)$,

$$= CF^2 \times \left(\frac{1}{CR} - \frac{1}{CE} \right), = CF^2 \times \frac{CE - CR}{CE \times CR}, = CF^2 \times$$

$$\frac{ER}{CE \times CR}, = \frac{CF^2}{CE} \times \frac{ER}{CR}.$$

But because CF is $\frac{1}{2}$ of CE, $\frac{CF^2}{CE}$ is $= \frac{CF^2}{2CF} = \frac{CF}{2}$, a constant quantity. Therefore

$$\text{the density of the light at I is proportional to } \frac{ER}{CR}, \text{ or to } \frac{AI}{bI},$$

because the points R and I are similarly situated in EC and Ab.

Farther, if the semi-aperture CE of the lens be called

$$I, \frac{CF^2}{2} \text{ is } = \frac{1}{2}, \text{ and the density at I is } = \frac{AI}{8bI}.$$

Here it is proper to observe, that since the point R has the same situation in the diameter EB that the point I has in the diameter AD of the circle of dispersion, the circle described on EB may be conceived as the magnified representation of the circle of dispersion. The point F, for instance, represents the point *f* in the circle of dispersion, which bisects the radius bA; and *f* receives no light from any part of the lens which is nearer the centre than F, being illuminated only by the light which comes through EF and its opposite BF. The same may be said of every other point.

In like manner, the density of the light in *f*, the middle

$$\text{between } b \text{ and } A, \text{ is measured by } \frac{EF}{CF}, \text{ which is } = \frac{EF}{EI}, \text{ or } 1.$$

This makes the density at this point a proper standard of comparison. The density there is to the density at I as 1

$$\text{to } \frac{AI}{bI}, \text{ or as } bI \text{ to } AI; \text{ and this is the simplest mode of}$$

comparison. The density half way from the centre of the circle of dispersion is to the density at any point I as *bI* to IA.

Lastly, through L describe the common rectangular hyperbola *kLn*, meeting the ordinates of the former in *k, L*, and *n*; and draw *kb* parallel to EC, cutting the ordinates in *g, f, r, &c.* Then $CR : CE = Ek : Rn$, and $CR : CE - CR = Ek : Rn - Ek$, or $CR : RE = Ek : rn$, and $bI : IA = Ek : rn$. And thus we have a very simple expression of the density in any point of the circle of dispersion. Let the point be anywhere, as at I. Divide the lens in R as AD is divided in I, and then *rn* is as the density in I.

These two measures were given by Newton; the first in his *Treatise de Mundi Systemate*, and the last in his *Optics*; but both without demonstration.

If the hyperbola *kLn* be made to revolve round the axis CQ, it will generate a solid spindle, which will measure the whole quantity of light which passes through different portions of the circle of dispersion. Thus the solid produced by the revolution of *Lkf* will measure all the light which occupies the outer part of the circle of dispersion lying without the middle of the radius. This space is $\frac{3}{4}$ ths of the whole circle; but the quantity of light is but $\frac{1}{4}$ th of the whole.

A still more simple expression of the whole quantity of light passing through different portions of the circle of chromatic dispersion may now be obtained as follows:

It has been demonstrated, that the density of the light at

Telescope.

I is as $\frac{AI}{bI}$, or as $\frac{ER}{CR}$. Suppose the figure to turn round the axis. I or R describe circumferences of circles; and the whole light passing through this circumference is as the circumference, or as the radius, and as the density jointly.

It is therefore as $\frac{ER}{CR} \times CR$, that is, as ER. Draw any straight line Em, cutting RN in s, and any other ordinate FL in xRs. The whole light which illuminates the circumference described by I is to the whole light which illuminates the centre b as ER to EC, or as Rs to Cm. In like manner, the whole light which illuminates the circumference described by the point f in the circle of dispersion is to the whole light which illuminates the centre b, as Fx to Cm. The lines Cm, RS, Fx, are therefore proportional to the whole light which illuminates the corresponding circumferences in the circle of dispersion. Therefore the whole light which falls on the circle whose radius is bI, will be represented by the trapezium in CRS; and the whole light which falls on the ring described by IA, will be represented by the triangle E s R; and so of any other portions.

By considering the figure, we see that the distribution of the light is exceedingly unequal. Round the margin it has no sensible density; while its density in the very centre is incomparably greater than in any other point, being expressed by the asymptote of a hyperbola. Also the circle described with the radius $\frac{Ab}{2}$ contains $\frac{1}{2}$ ths of the whole light.

No wonder then that the confusion caused by the mixture of these circles of dispersion is less than one should expect; besides, it is evident that the most lively or impressive colours occupy the middle of the spectrum, and are there much denser than the rest. The margin is covered with an illumination of deep red and violet, neither of which colours are brilliant. The margin will be of a dark claret colour. The centre revives all the colours, but in a proportion of intensity greatly different from that in the common prismatic spectrum, because the radiant points L, p, b, g, &c. by which it is illuminated, are at such different distances from it. It will be white; but we apprehend not a pure white, being greatly overcharged with the middle colours.

These considerations show that the coloured fringes, which are observed to border very luminous objects seen on a dark ground through optical instruments, do not proceed from the object-glass of a telescope or microscope, but from an improper construction of the eye-glasses. The chromatic dispersion would produce fringes of a different colour, when they produce any at all, and the colours would be differently disposed. But this dispersion by the object-glass can hardly produce any fringes: its effect is a general and almost uniform mixture of circles all over the field, which produces an uniform haziness, as if the object were viewed at an improper distance, or out of its focus, as we vulgarly express it.

We may at present form a good guess at the limit which this cause puts to the performance of a telescope. A point of a very distant object is represented, in the picture formed by the object-glass, by a little circle, whose diameter is at least $\frac{1}{100}$ th of the aperture of the object-glass, making a very full allowance for the superior brilliancy and density of the central light. We look at this picture with a magnifying eye-glass. This magnifies the picture of the point. If it amplify it to such a degree as to make it an object individually distinguishable, the confusion is then sensible. Now this can be computed. An object subtending one minute of a degree is distinguished by the dullest eye, even although it be a dark object on a bright ground. Let us therefore sup-

pose a telescope, the object-glass of which is of six feet focal distance, and one inch aperture. The diameter of the circle of chromatic dispersion will be $\frac{1}{100}$ th of an inch, which subtends at the centre of the object-glass an angle of about $9\frac{1}{2}$ seconds. This, when magnified six times by an eye-glass, would become a distinguishable object; and a telescope of this length would be indistinct: it magnified more than six times, if a point were thus spread out into a spot of uniform intensity. But the spot is much less intense about its margin. It is found experimentally that a piece of engraving, having fine cross hatches, is not sensibly indistinct till brought so far from the limits of perfectly distinct vision, that this indistinctness amounts to 6' or 5' in breadth.— Therefore such a telescope will be sensibly distinct when it magnifies 36 times; and this is very agreeable to experience.

We come, in the second place, to the more arduous task of ascertaining the error arising from the spherical figure of the surfaces employed in optical instruments.— Suffice it to say, before we begin, that although geometers have exhibited other forms of lenses which are totally exempt from this error, they cannot be executed by the art; and we are therefore restricted to the employment of spherical surfaces.

Of all the determinations which have been given of spherical aberration, that by Dr Smith, in his Optics, which is an improvement of the fundamental theorem of that most elegant geometer Huyghens, is the most perspicuous and palpable. Some others are more concise, and much better fitted for after use, and will therefore be employed by us in the prosecution of this article. But they do not keep in view the optical facts, giving the mind a picture of the progress of the rays, which it can contemplate and discover amidst many modifying circumstances. By ingenious substitutions of analytical symbols, the investigation is rendered expeditious, concise, and certain; but these are not immediate symbols of things, but of operations of the mind; objects sufficiently subtle of themselves, and having no need of substitutions to make us lose sight of the real subject; and thus our occupation degenerates into a process almost without ideas. We shall therefore set out with Dr Smith's fundamental Theorem.

1. In Reflections.

Let AVB (fig. 3.) be a concave spherical mirror, of which C is the centre, V the vertex, CV the axis, and F the focus of an infinitely slender pencil of parallel rays passing through the centre. Let the ray aA, parallel to the axis, be reflected in AG, crossing the central ray CV in f. Let AP be the sine of the semi-aperture AV, AD its tangent, and CD its secant.

The aberration Ff from the principal focus of central rays is equal to $\frac{1}{2}$ of the excess VD of the secant above the radius, or very near equal to $\frac{1}{2}$ of VP, the versed sine of the semi-aperture.

For because AD is perpendicular to CA, the points C, A, D, are in a circle, of which CD is the diameter; and because Af is equal to Cf, by reason of the equality of the angles fAC, fCA, and CA a, f is the centre of the circle through C, A, D, and fD is $= \frac{1}{2}$ CD. But FC is $= \frac{1}{2}$ CV. Therefore Ff is $\frac{1}{2}$ of VD.

But because DV : VP = DC : VC, and DC is very little greater than VC when the aperture AB is moderate, DV is very little greater than VP, and Ff is very nearly equal to $\frac{1}{2}$ of VP.

Cor. 1. The longitudinal aberration is $= \frac{AV^2}{4CV}$, for PV is very nearly $= \frac{AV^2}{2CV}$.

Cor. 2. The lateral aberration FG is $= \frac{AV^3}{2CV^2}$. For $FG : Ff = AP : Pf = AV : \frac{1}{2} CV$ nearly, and therefore $FG = \frac{AV^3}{4CV} \times \frac{2}{CV} = \frac{AV^3}{2CV^2}$.

2. In Refractions.

Let AVB (fig. 4. A or B) be a spherical surface separating two refracting substances, C the centre, V the vertex, AV the semi aperture, AP its sine, PV its versed sine, and F the focus of parallel rays infinitely near to the axis. Let the extreme ray aA , parallel to the axis, be refracted into AG , crossing CF in f , which is therefore the focus of extreme parallel rays.

The rectangle of the sine of incidence, by the difference of the sines of incidence and refraction, is to the square of the sine of refraction, as the versed sine of the semi-aperture is to the longitudinal aberration of the extreme rays.

Call the sine of incidence i , the sine of refraction r , and their difference d .

Join CA , and about the centre f describe the arch AD .

The angle ACV is equal to the angle of incidence, and CAf is the angle of refraction. Then, since the sine of incidence is to the sine of refraction as VF to CF , or as Af to Cf , that is, as Df to Cf , we have

$$CF : FV = Cf : fD$$

$$\text{by conversion } CF : CV = Cf : CD$$

altern. conver. $CF - Cf : CV - CD = CF : CV$

or $Ff : VD = CF : CV, = r : d$.

Now $PV = \frac{AP^2}{CP + CV} = \frac{AP^2}{2CV}$ nearly, and $PD = \frac{AP^2}{fP + fV}$

$= \frac{AP^2}{2fV}$ nearly, $= \frac{AP^2}{2fV}$ nearly. Therefore $PV : PD$

$= FV : CV$, and $DV : PV = CF : FV$ nearly.

We had above $Ff : VD = r : d$;

and now $VD : PV = CF : FV, = r : i$;

therefore $Ff : PV = r^2 : di$,

and $Ff = \frac{r^2}{di} \times PV$. Q. E. D.

The aberration will be different according as the refraction is made towards or from the perpendicular; that is, according as r is less or greater than i . They are in the ratio of $\frac{r^3}{di}$ to $\frac{i^2}{dr}$, or of r^3 to i^3 . The aberration therefore is always much diminished when the refraction is made from a rare into a dense medium. The proportion of the sines for air and glass is nearly that of 3 to 2. When the light is refracted into the glass, the aberration is nearly $\frac{1}{3}$ of PV ; and when the light passes out of glass into air, it is about $\frac{2}{3}$ of PV .

Cor. 1. $Ff = \frac{r^2}{di} \times \frac{AP^2}{2CV}$ nearly, and it is also $= \frac{r^2}{d^2} \times \frac{AP^2}{FV}$, because $PV = \frac{AP^2}{2CV}$ nearly, and $i : d = FV : CV$.

Cor. 2. Because $fP : PA = Ff : FG$
or $FV : AV = Ff : FG$ nearly,

we have FG , the lateral aberration, $= Ff \times \frac{AV}{FV} = \frac{r^2}{d^2}$

$$\times \frac{AV^3}{2FV^2} = \frac{r^2}{i^2} \times \frac{AV^3}{2CV^2}$$

Cor. 3. Because the angle $F'Af$ is proportional to $\frac{FG}{FV}$ very

nearly, we have the angular aberration $F'Af = \frac{r^2}{d^2} \times$

$$\frac{AV^3}{FV^2} = \frac{r^2}{i^2} \times \frac{AV^3}{2CV^2}$$

In general, the longitudinal aberrations from the focus of central parallel rays are as the squares of the apertures directly, and as the focal distances inversely; and the lateral aberrations are as the cubes of the apertures directly, and the squares of the focal distances inversely; and the angular aberrations are as the cubes of the aperture directly, and the cubes of the focal distances inversely.

The reader must have observed, that to simplify the investigation, some small errors are admitted. PV and PD are not in the exact proportion that we assumed them, nor is Df equal to FV . But in the small apertures which suffice for optical instruments, these errors may be disregarded.

This spherical aberration produces an indistinctness of vision, in the same manner as the chromatic aberration does, viz. by spreading out every mathematical point of the object into a little spot in its picture; which spots, by mixing with each other, confuse the whole. We must now determine the diameter of the circle of diffusion, as we did in the case of chromatic dispersion.

Let a ray βx (fig. 5.) be refracted on the other side of the axis, into aH , cutting AfG in H , and draw the perpendicular EH . Call $AV a$, $aV x$, Vf (or VF , or Vf), which in this comparison may be taken as equal) $= f$, $Ff = b$, and $fE = r x$.

$AV^2 : aV^2 = Ff : Fx$ (already demonstrated) and $Fp = \frac{a^2}{a^2} b$, and $Ff - Fx$, (or $f x$) $= b - \frac{a^2}{a^2} b = \frac{a^2 b - a^2 b}{a^2}$,

$= \frac{b}{a^2} \times a^2 - a^2 = \frac{b}{a^2} \times a + a \times a - a^2$. Also $Ff : PA$

$= fE : EH$, or $f : a = x : \frac{a x}{f} = EH$. And $Px : Pz =$

$EH : E z$, or $a : f = \frac{a x}{f} : \frac{a x}{a} = E z$. Therefore $f p =$

$\frac{a x}{a} + x = \frac{a + x x}{a} = \frac{x}{a} \times a + a$. Therefore $\frac{x}{a} \times a + a =$

$\frac{b}{a^2} \times a + a \times a - a^2$, and $\frac{x}{a} = \frac{b}{a^2} \times a - a$, and $x = \frac{b}{a} \times$

$(a - a)$. Therefore x is greatest when $a \times a - a$ is greatest; that is, when $a = \frac{1}{2} a$. Therefore EH is greatest when Pz is equal to the half of AP . When this is the case, we

have at the same time $\frac{b}{a^2} \times a (a - a) = \frac{b}{a^2} \times \frac{1}{2} a^2$, and x

$= \frac{1}{2} b$, or $EH = \frac{1}{2} FG$. That is, the diameter of the circle of aberration through which the whole of the refracted light must pass, is $\frac{1}{2}$ of the diameter of the circle of aberration at the focus of parallel central rays. In the chromatic aberration it was $\frac{1}{3}$; so that in this respect the spherical aberration does not create so great confusion as the chromatic.

We are now able to compare them, since we have now the measure of both the circles of aberration.

It has not been found possible to give more than four inches of aperture to an object glass of 100 feet focal distance, so as to preserve sufficient distinctness. If we compute the diameter of the circle EH corresponding to this

aperture, we shall find it not much to exceed $\frac{1}{120,000}$ of an

inch. If we restrict the circle of chromatic dispersion to $\frac{1}{150}$ of the aperture, which is hardly the sixth part of the

whole dispersion in it, it is $\frac{1}{62 \frac{1}{2}}$ of an inch, and is about

1900 times greater than the other.

The circle of spherical aberration of a plano-convex lens, with the plane side next the distant object, is equal to the circle of chromatic dispersion when the semi-aperture is

about

Telescope about 15° : For we saw formerly that EH is $\frac{1}{3}$ of FG , and that FG is $= \frac{r^2}{i^2} \frac{AP^2}{2AC}$, and therefore $EG = \frac{r^2}{i^2} \times \frac{AP^2}{8AC^2}$.

This being made $= \frac{AP}{55}$, gives us $AP = \sqrt{\frac{8i^2 AC^2}{55r^2}}$,

which is nearly $\frac{AC}{4}$, and corresponds to an aperture of 30° diameter, if r be to i as 3 to 2 .

Sir Isaac Newton was therefore well entitled to say, that it was quite needless to attempt figures which should have less aberration than spherical ones, while the confusion produced by the chromatic dispersion remained uncorrected. Since the indistinctness is as the squares of the diameters of the circles of aberration, the disproportion is quite beyond our imagination, even when Newton has made such a liberal allowance to the chromatic dispersion. But it must be acknowledged, that he has not attended to the distribution of the light in the circle of spherical aberration, and has hastily supposed it to be like the distribution of the coloured light, indefinitely rare in the margin, and denser in the centre.

We are indebted to Father Boscovich for the elegant determination of this distribution, which we have given in the article OPTICS. From this it appears, that the light in the margin of the circle of spherical aberration, instead of being incomparably rarer than in the spaces between it and the centre, is incomparably denser. The indistinctness therefore produced by the intersection of these luminous circumferences is vastly great, and increases the whole indistinctness exceedingly. By a gross calculation which we made, it appears to be increased at least 500 times. The proportional indistinctness therefore, instead of being 1900^2

to 1 , is only $\frac{1900^2}{500}$, or nearly 7220 to 1 ; a proportion still

sufficiently great to warrant Newton's preference of the reflecting telescope of his invention. And we may now observe, that the reflecting telescope has even a great advantage over a refracting one of the same focal distance, with respect to its spherical aberration: For we have seen (*Cor.*

2.) that the lateral aberration is $\frac{r^2}{i^2} \frac{AV^3}{2CV^2}$. This for a plano-

convex glass is nearly $\frac{2}{4} \frac{AV^3}{2CV^2}$. And the diameter of the

circle of aberration is one-fourth of this, or $\frac{9}{16} \times \frac{AV^3}{2CV^2}$.

In like manner, the lateral aberration of a concave mirror is $\frac{AV^3}{2CV^2}$; and the diameter of the circle of dispersion is

$\frac{AV^3}{8CV^2}$; and therefore if the surfaces were portions of the

same sphere, the diameter of the circle of aberration of refracted rays would be to that of the circle of aberration of reflected rays as $\frac{9}{8}$ to $\frac{1}{4}$, or as 9 to 4 . But when the refracting and reflecting surfaces, in the position here considered, have the same focal distance, the radius of the refracting surface is four times that of the reflecting surface. The proportion of the diameters of the circles of spherical aberration is that of 9×4^2 to 4 , or of 144 to 4 , or 36 to 1 . The distinctness therefore of the reflector is 36×36 , or 1296 times greater than that of a plano-convex lens (placed with the plane side next the distant object) of the same breadth and focal distance, and will therefore admit of a much greater magnifying power. This comparison is indeed made in circumstances most favourable to the reflector, because this is the very worst position of a plano-convex lens. But we have not as yet learned the aberration in any

other position. In another position the refraction and consequent aberration of both surfaces are complicated.

Before we proceed to the consideration of this very difficult subject, we may deduce from what has been already demonstrated several general rules and maxims in the construction of telescopes, which will explain (to such readers as do not wish to enter more deeply into the subject), and justify the proportion which long practice or the best artists has sanctioned.

Indistinctness proceeds from the commixture of the circles of aberration on the retina of the eye: For any one sensible point of the retina, being the centre of a circle of aberration, will at once be affected by the admixture of the rays of as many different pencils of light as there are sensible points in the area of that circle, and will convey to the mind a mixed sensation of as many visible points of the object. This number will be as the area of the circle of aberrations, whatever be the size of a sensible point of the retina. Now in vision with telescopes, the diameter of the circle of aberration on the retina is as the apparent magnitude of the diameter of the corresponding circle in the focus of the eye-glass; that is, as the angle subtended by this diameter at the centre of the eye-glass; that is, as the diameter itself directly, and as the focal distance of the eye-glass inversely. And the area of that circle on the retina is as the area of the circle in the focus of the eye-glass directly, and as the square of the focal distance of the eye-glass inversely. And this is the measure of the apparent indistinctness.

Cor. In all sorts of telescopes, and also in compound microscopes, an object is seen equally distinct when the focal distance of the eye-glasses are proportional to the diameters of the circles of aberration in the focus of the object-glass.

Here we do not consider the trifling alteration which well constructed eye-glasses may add to the indistinctness of the first image.

In refracting telescopes, the apparent indistinctness is as the area of the object-glass directly, and as the square of the focal distance of the eye-glass inversely. For it has been shown, that the area of the circle of dispersion is as the area of the object-glass, and that the spherical aberration is insignificant when compared with this.

Therefore, to make reflecting telescopes equally distinct, the diameter of the object-glass must be proportional to the focal distance of the eye-glass.

But in reflecting telescopes, the indistinctness is as the sixth power of the aperture of the object-glass directly, and as the fourth power of the focal distance of the object-glass and square of the focal distance of the eye-glass inversely. This is evident from the dimensions of the circle of aberration,

which was found proportional to $\frac{AV^3}{CV^2}$.

Therefore, to have them equally distinct, the cubes of the apertures must be proportional to the squares of the focal distance multiplied by the focal distance of the eye-glass.

By these rules, and a standard telescope of approved goodness, an artist can always proportion the parts of any instrument he wishes to construct. Mr Huyghens made one, of which the object-glass had 30 feet focal distance and three inches diameter. The eye-glass had $3\frac{1}{3}$ inches focal distance. And its performance was found superior to any which he had seen; nor did this appear owing to any chance goodness of the object-glass, because he found others equally good which were constructed on similar proportions. This has therefore been adopted as a standard.

It does not at first appear how there can be any d'Arcy

aperture in this matter, because we can always diminish the aperture of the object-glass or speculum till the circle of aberration is as small as we please. But by diminishing this aperture, we diminish the light in the duplicate ratio of the aperture. Whatever be the aperture, the brightness is diminished by the magnifying power, which spreads the light over a greater surface in the bottom of the eye. The apparent brightness must be as the square of the aperture of the telescope directly, and the square of the amplification of the diameter of an object inversely. Objects therefore will be seen equally bright if the apertures of the telescopes be as the focal distances of the object-glasses directly, and the focal distances of the single eye-glass (or eye-glass equivalent to the eye-piece) inversely. Therefore, to have telescopes equally distinct and equally bright, we must combine these proportions with the former. It is needless to go farther into this subject, because the construction of reflecting telescopes has been so materially changed by the correction of the chromatic aberration, that there can hardly be given any proportion between the object-glasses and eye-glasses. Every thing now depends on the degree in which we can correct the aberrations of the object-glasses. We have been able so far to diminish the chromatic aberration, that we can give very great apertures without its becoming sensible. But this is attended with so great an increase of the aberration of figure, that this last becomes a sensible quality. A lens which has 30° for its semi aperture, has a circle of aberration equal to its chromatic aberration. Fortunately we can derive from the very method of contrary refractions, which we employ for removing the chromatic aberration, a correction of the other. We are indebted for this contrivance also to the illustrious Newton.

We call this Newton's contrivance, because he was the first who proposed a construction of an object-glass in which the aberration was corrected by the contrary aberrations of glass and water.

Huyghens had indeed supposed, that our all-wise Creator had employed in the eyes of animals many refractions in place of one, in order to make the vision more distinct; and the invidious detractors from Newton's fame have caught at this vague conjecture as an indication of his knowledge of the possibility of destroying the aberration of figure by contrary refractions. But this is very ill-founded. Huyghens has acquired sufficient reputation by his theory of aberrations. The scope of his writing in the passage alluded to, is to show that, by dividing any intended refraction into parts, and producing a certain convergence to or divergence from the axis of an optical instrument by means of two or three lenses instead of one, we diminish the aberrations four or nine times. This conjecture about the eye was therefore in the natural train of his thoughts. But he did not think of destroying the aberration altogether by opposite refractions. Newton, in 1669, says, that opticians need not trouble themselves about giving figures to their glasses other than spherical. If this figure were all the obstacle to the improvement of telescopes, he could show them a construction of an object-glass having spherical surfaces where the aberration is destroyed; and accordingly gives the construction of one composed of glass and water, in which this is done completely by means of contrary refractions.

The general principle is this: When the radiant point R (fig. 5. B), or focus of incident rays, and its conjugate focus F of refracted central rays, are on opposite sides of the refracting surface or lens V, the conjugate focus f of marginal rays is nearer to R than F is. But when the focus of incident rays R' lies on the same side with its conjugate focus F' for central rays, R' f is greater than R' F'.

Now fig. 5. C represents the contrivance for destroying the colour produced at F, the principal focus of the convex lens V, of crown glass, by means of the contrary refraction of the concave lens v of flint glass. The incident parallel rays are made to converge to F by the first lens. This convergence is diminished, but not entirely destroyed, by the concave lens v , and the focus is formed in F'. F and F' therefore are conjugate foci of the concave lens. If F be the focus of V for central rays, the marginal rays will be collected at some point f nearer to the lens. If F be now considered as the focus of light incident on the centre of v , and F' be the conjugate focus, the marginal ray pF would be refracted to some point f' lying beyond F'. Therefore the marginal ray $p'f$ may be refracted to F, if the aberration of the concave be properly adjusted to that of the convex.

This brings us to the most difficult part of our subject, the compounded aberrations of different surfaces. Our limits will not give us room for treating this in the same elementary and perspicuous manner that we employed for a single surface. We must try to do it in a compendious way, which will admit at once the different surfaces and the different refractive powers of different substances. This must naturally render the process more complicated; but we hope to treat the subject in a way easily comprehended by any person moderately acquainted with common algebra; and we trust that our attempt will be favourably received by an indulgent public, as it is (as far as we know) the only dissertation in our language on the construction of achromatic instruments. We cannot but express our surprise at this indifference about an invention which has done so much honour to our country, and which now constitutes a very lucrative branch of its manufacture. Our artists infinitely surpass all the performances of foreigners in this branch, and supply the markets of Europe without any competition; yet it is from the writings on the continent that they derive their scientific instruction, and particularly from the dissertations of Clairaut, who has wonderfully simplified the analysis of optical propositions. We shall freely borrow from him, and from the writings of Abbé Boilevich, who has considerably improved the first views of Clairaut. We recommend the originals to the curious reader. Clairaut's dissertations are to be found in the Memoirs of the Academy of Paris, 1756, &c.; those of Boilevich in the Memoirs of the Academy of Bologna, and in his five volumes of *Opuscula*, published at Bassano in 1785. To these may be added D'Alembert and Euler. The only thing in our language is the translation of a very imperfect work by Scherffer.

Lemma 1. In the right-angled triangle MXS (fig. 6.), of which one side MX is very small in comparison of either of the others; the excess of the hypotenuse MS, above the side XS, is very nearly equal to $\frac{MX^2}{2MS}$ or to $\frac{MX}{2XS}$. For if about the centre S, with the radius SM, we describe the semicircle AMO, we have $AX \times XO = MX^2$. Now $AX = MS - SX$, and XO , is nearly equal to $2MS$ or $2XS$; on the other hand, MS is nearly equal to $XS + \frac{MX^2}{2XS}$; and in like manner MG is nearly equal to $\frac{MX^2}{2XG} + XG$, and MH is nearly equal to $\frac{MX^2}{2XH} + XH$.

PROP. I. Let the ray mM , incident on the spherical surface AM, converge to G; that is, let G be the focus of

Telescope incident rays. It is required to find the focus F of refracted rays?

Let m express the ratio of the sine of incidence and refraction; that is, let m be to 1 as the sine of incidence to the sine of refraction in the substance of the sphere.

Then $MG : GS = \sin. MSH : \sin. SMG$, and $m : 1 = \sin. SMG : \sin. SMH$; therefore $m \times MG : GS = \sin. MSH : \sin. SMH$. Now $S, MSH : S, SMH = MH : HS$. Therefore, finally, $m. MG : GS = MH : HS$.

Now let MS , the radius of the refracting surface, be called a . Let AG , the distance of the focus of incident rays from the surface, be called r . And let AH , the focal distance of refracted rays, be called x . Lastly, let the line MX of the semi-opening be called e . Observe, too, that a, r, x , are to be considered as positive quantities, when $\Delta S, AG, AH$, lie from the surface in the direction in which the light is supposed to move. If therefore the refracting surface be concave, that is, having the centre on that side from which the light comes; or if the incident rays are divergent, or the refracted rays are divergent; then a, r, x , are negative quantities.

It is plain that $HS = x - a$; $GS = r - a$; also $AX = \frac{e^2}{2a}$ nearly. $HX = a - \frac{e^2}{2a}$. $GX = r - \frac{e^2}{2a}$. Now add to HX and to GX their differences from MH and MG , which (by the Lemma) are $\frac{e^2}{2x}$ and $\frac{e^2}{2r}$. We get $MH = x - \frac{e^2}{2a} + \frac{e^2}{2x}$, and $MG = r - \frac{e^2}{2a} + \frac{e^2}{2r}$. In order to shorten our notation, make $k = \frac{1}{a} - \frac{1}{r}$. This will make $MG = r - \frac{k e^2}{2}$.

Now substitute these values in the final analogy at the top of this column, viz. $MH : HS = m. MG : GS$; it becomes $x - \frac{e^2}{2a} + \frac{e^2}{2x} : x - a = m r - \frac{m k e^2}{2} : r - a$ (or ark), because $k = \frac{r - a}{ar}$, and $ark = r - a$. Now multiply the extreme and mean terms of this analogy. It is evident that it must give us an equation which will give us a value of x or AH , the quantity sought.

But this equation is quadratic. We may avoid the solution by an approximation which is sufficiently accurate, by substituting for x in the fraction $\frac{e^2}{2x}$ (which is very small in all cases of optical instruments), an approximate value very easily obtained, and very near the truth. This is the focal distance of an infinitely slender pencil of rays converging to G . This we know by the common optical theorem to be $\frac{amr}{m - 1 r - a}$. Let this be called φ ; if we substitute

$$k \text{ in place of } \frac{1}{a} - \frac{1}{r}, \text{ this value of } \varphi \text{ becomes } = \frac{am}{m - ak}.$$

This gives us, by the by, an easily remembered expression (and beautifully simple) of the refracted focus of an infinitely slender pencil, corresponding to any distance r of the radiant point. For since $\varphi = \frac{am}{m - ak}$, $\frac{1}{\varphi}$ must be $= \frac{m - ak}{am}$, $= \frac{m}{am} - \frac{ak}{am}$, $= \frac{1}{a} - \frac{k}{m}$. We may even express it

more simply, by expanding k , and it becomes $\frac{1}{\varphi} = \frac{1}{a} - \frac{1}{ma}$

$$- \frac{1}{mr}.$$

Now put this value of $\frac{1}{\varphi}$ in place of the $\frac{1}{\varphi}$ in the analogy employed above. The first term of the analogy becomes

$$x - \frac{e^2}{2a} + \frac{e^2}{2a} - \frac{k e^2}{2m}, \text{ or } x - \frac{k e^2}{2m}. \text{ The analogy now becomes } x - \frac{k e^2}{2m} : x - a = m r - \frac{m k e^2}{2} : ark. \text{ Hence we obtain the}$$

$$\text{linear equation } m r x - \frac{m k e^2 x}{2} - m r a + \frac{m k a e^2}{2} = a r k x - \frac{a r k e^2}{2m}; \text{ from which we finally deduce}$$

$$x = \frac{m r a - \frac{1}{2} m a k e^2 - \frac{a r k^2 e^2}{2m}}{m r - a k - \frac{1}{2} m k e^2}$$

We may simplify this greatly by attending to the elementary theorem in fluxions, that the fraction $\frac{x + \dot{x}}{y + \dot{y}}$ differs

from the fraction $\frac{\dot{x} y - x \dot{y}}{y^2}$ by the quantity $\frac{y \dot{x} - x \dot{y}}{y^2}$; this being the fluxion of $\frac{x}{y}$. Therefore $\frac{x + \dot{x}}{y + \dot{y}} = \frac{x}{y} + \frac{y \dot{x} - x \dot{y}}{y^2}$. Now

the preceding formula is nearly in this situation. It may be written thus; $\frac{m r a - (\frac{1}{2} m a k e^2 - \frac{a r k^2 e^2}{2m})}{m r - a r k - m k e^2}$, when

the last terms of the numerator and denominator are very small in comparison with the first, and may be considered as the \dot{x} and \dot{y} , while $m r a$ is the x , and $m r - a r k$ is the y . Treating it in this way, it may be stated thus:

$$x = \frac{m r a}{m r - a r k} + \frac{(m r a) \frac{1}{2} m k e^2 - (m r - a r k) (\frac{1}{2} m k a e^2 + \frac{a r k^2 e^2}{2m})}{r^2 (m - a k)^2}$$

$$\text{or } x = \frac{m r a}{r (m - a k)} + \frac{(m r a) m k - (m r - a r k) (m k a + \frac{a r k^2}{m})}{r^2 (m - a k)^2} \times \frac{1}{2} e^2.$$

The first term $\frac{m r a}{r (m - a k)}$, or $\frac{m a}{m - a k}$, is evidently $= \varphi$, the focal distance of an infinitely slender pencil. Therefore the aberration is expressed by the second term, which we must endeavour to simplify.

If we now perform the multiplications indicated by $(m r - a r k) \times (m k a - \frac{a r k^2}{m})$, it is plain that $- m r \times m k a$ destroys the first term $m r a \times m k$ of the numerator of our small fraction, and there remains of this numerator $(m a^2 r k^2 - a r^2 k^2 + \frac{a^2 r^2 k}{m}) \frac{1}{2} e^2$, which is equal to $m^2 a^2 (\frac{r k^2}{m} - \frac{r^2 k^2}{m^2 a} + \frac{r^2 k^2}{m^3}) \frac{1}{2} e^2$.

The denominator was $r^2 (m - a k)^2$, and the fraction now becomes $\frac{m^2 a^2}{(m - a k)^2} (\frac{k^2}{m r} - \frac{k^2}{m^2 a} + \frac{k^2}{m^3}) \frac{1}{2} e^2$, which is evidently $= \varphi^2 (\frac{k^2}{m r} - \frac{k^2}{m^2 a} + \frac{k^2}{m^3}) \frac{e^2}{2}$. Now recollect that

$$k = \frac{1}{a} - \frac{1}{r}. \text{ Therefore } \frac{k^3}{m^2} = \frac{k^2}{m^2} (\frac{1}{a} - \frac{1}{r}) = \frac{k^2}{m^2 a} - \frac{k^2}{m^2 r}.$$

Therefore, instead of $-\frac{k^2}{m^2 a}$, write $-\frac{k^3}{m^2} + \frac{k^2}{m^2 r}$, and we get the fraction $\varphi^2 (\frac{k^3}{m^2} - \frac{k^3}{m^2} - \frac{k^2}{m^2 r} + \frac{k^2}{m^2 r}) \frac{e^2}{2} = \varphi^2 (\frac{k^3}{m} - \frac{m k^3}{m^3} - \frac{m k^2}{m^2 r})$

ope $\frac{m k^2}{m^2 r} + \frac{m^2 k^2}{m^3 r} \frac{e^2}{2}$, which is equal to $\frac{1-m}{m^3} \left(k^2 - \frac{m k^2}{r} \right) \frac{e^2}{2}$,

and finally to $-\frac{e^2}{2} \frac{m-1}{m^3} \left(k^2 - \frac{m k^2}{r} \right) \frac{e^2}{2}$.

Therefore the focal distance of refracted rays is $x = \frac{e^2}{2} \frac{m-1}{m^3} \left(k^2 - \frac{m k^2}{r} \right) \frac{e^2}{2}$.

This consists of two parts. The first $\frac{e^2}{2}$ is the focal distance of an infinitely slender pencil of central rays, and the other $-\frac{e^2}{2} \frac{m-1}{m^3} \left(k^2 - \frac{m k^2}{r} \right) \frac{e^2}{2}$ is the aberration arising from the spherical figure of the refracting surface.

Our formula has thus at last put on a very simple form, and is vastly preferable to Dr Smith's for practice.

This aberration is evidently proportional to the square of the semi-aperture, and to the square of the distance $\frac{e^2}{2}$; but, in order to obtain this simplicity, several quantities were neglected. The assumption of the equality of AX to $\frac{e^2}{2a}$ is the first source of error. A much more accurate value of it would have been $\frac{2 a e^2}{4 a^2 + e^2}$, for it is really $= \frac{e^2}{2 a - AX}$. If

for AX we substitute its approximated value $\frac{e^2}{2a}$, we should have $AX = \frac{e^2}{2a - \frac{e^2}{2a}} = \frac{2 a e^2}{4 a^2 - e^2}$. To have used this va-

lue would not have much complicated the calculus; but it did not occur to us till we had finished the investigation, and it would have required the whole to be changed. The operation in page 346. col. 2. par. 2. is another source of error. But these errors are very inconsiderable when the aperture is moderate. They increase for the most part with an increase of aperture, but not in the proportion of any regular function of it; so that we cannot improve the formula by any manageable process, and must be contented with it. The errors are precisely the same with those of Dr Smith's theorem, and indeed with those of any that we have seen, which are not vastly more complicated.

As this is to be frequently combined with subsequent operations, we shorten the expression by putting ϕ for $\frac{m-1}{m^3} \left(k^2 - \frac{m k^2}{r} \right) \frac{e^2}{2}$. Then ϕ^2 will express the aberration of the first refraction from the focal distance of an infinitely slender pencil; and now the focal distance of refracted rays is $f = \frac{e^2}{2} - \phi^2$.

If the incident rays are parallel, r becomes infinite, and $\phi = \frac{m-1}{m^3} k^2 \frac{e^2}{2}$. But in this case k becomes $= \frac{1}{a}$, and $\frac{1}{\phi} = \frac{m a}{m-1}$, and ϕ becomes $\frac{m^2 a^2}{(m-1)^2} \times \frac{m-1}{m^3} \times \frac{1}{a^2} \times \frac{e^2}{2} = \frac{e^2}{2(m-1) m a}$. This is the aberration of extreme parallel rays.

We must now add the refraction of another surface.
Lemma 2. If the focal distance AG be changed by a small quantity Gg, the focal distance AH will also be changed by a small quantity Hh, and we shall have $m \cdot AG^2 : AH^2 = Gg : Hh$.

Draw M_g, M_h, and the perpendiculars G_i, H_k. Then, because the sines of the angles of incidence are in a constant ratio to the sines of the angles of refraction, and the increments of these small angles are proportional to the increments of the sines, these increments of the angles are in the same constant ratio. Therefore,

We have the angle CM_g to HM_h as m to 1 .

Now $Gg : Gi = AG : AM$,
and $Gi : bk = m \cdot AG : HA$,
and $kl : Hh = MA : AH$;
therefore $Gg : Hh = m \cdot AG^2 : AH^2$.

The easiest and most perspicuous method for obtaining the aberration of rays twice refracted, will be to consider the first refraction as not having any aberration, and determine the aberration of the second refraction. Then conceive the focus of the first refraction as shifted by the aberration. This will produce a change in the focal distance of the second refraction, which may be determined by this Lemma.

PROP. II. Let AM, BN (fig. 7.) be two spherical surfaces, including a refracting substance, and having their centres C and c in the line AG. Let the ray aA pass through the centres, which it will do without refraction. Let another ray mM, tending to G, be refracted by the first surface into MH, cutting the second surface in N, where it is farther refracted into NI. It is required to determine the focal distance BI?

It is plain that the sine of incidence on the second surface is to the sine of refraction into the surrounding air as 1 to m . Also BI may be determined in relation to BH, by means of BH, Nx, Bc, and $\frac{1}{m}$, in the same way that AH was determined in relation to AG, by means of AG, MX, AC, and m .

Let the radius of the second surface be b , and let e still express the semi-aperture, (because it hardly differs from Nx). Also let α be the thickness of the lens. Then observe, that the focal distance of the rays refracted by the first surface, (neglecting the thickness of the lens and the aberration of the first surface), is the distance of the radiant point for the second refraction, or is the focal distance of rays incident on the second surface. In place of r therefore we must take $\frac{1}{\phi}$; and as we made $k = \frac{1}{a} - \frac{1}{r}$, in order to abbreviate the cal-

culus, let us now make $l = \frac{1}{b} - \frac{1}{\phi}$; and make $\frac{1}{f} = \frac{1}{b} - m l$, as we made $\frac{1}{\phi} = \frac{1}{a} - \frac{k}{m}$. Lastly, in place of $\phi^2 = \frac{m-1}{m^3} \left(k^2 - \frac{m k^2}{r} \right) \frac{e^2}{2}$, make $\phi^2 = \left(\frac{1}{m} - 1 \right) m^3 \left(l^2 - \frac{l^2}{\phi} \right) \frac{e^2}{2} = -\frac{m-1}{m} \left(m^3 l^2 - \frac{m^2 l^2}{\phi} \right) \frac{e^2}{2}$.

Thus we have got an expression similar to the other; and the focal distance BI, after two refractions, becomes $BI = f - f^2 \phi^2$.

But this is on the supposition that BH is equal to α , whereas it is really $\phi - \phi^2 - \alpha$. This must occasion a change in the value just now obtained of BI. The source of the change is twofold. 1st, Because, in the value $\frac{1}{\phi} - \frac{1}{\phi}$, we

must put $\frac{1}{b} - \frac{1}{\phi - \phi^2 - \alpha}$, and because we must do the same in the fraction $\frac{m^2 l^2}{\phi}$. In the second place, when the value of BH is diminished by the quantity $\phi^2 + \alpha$, BI will suffer a change in the proportion determined by the 2^d Lemma. The first difference may safely be neglected, because the value of ϕ is very small, by reason of the coefficient $\frac{e^2}{2}$ being very small, and also because the variation bears a very small ratio to the quantity itself, when the true value of ϕ

Telescope. differs but little from that of the quantity for which it is employed. The chief change in BI is that which is determined by the Lemma. Therefore take from BI the variation of BH, multiplied by $\frac{mBI^2}{BH^2}$, which is very nearly $\frac{mf^2}{\varphi^2}$. The product of this multiplication is $mf^2\theta + \frac{mf^2\alpha}{\varphi^2}$. This being taken from f , leaves us for the value of BI $f - \frac{f^2m\alpha}{\varphi^2} - f^2(m\theta + \theta)$.

In this value f is the focal distance of an infinitely slender pencil of rays twice refracted by a lens having no thickness, $\frac{mf^2}{\varphi}$ is the shortening occasioned by the thickness, and $f^2(m\theta + \theta)$ is the effect of the two aberrations arising from the aperture.

It will be convenient, for several collateral purposes, to exterminate from these formulae the quantities $k, l,$ and r .

For this purpose make $\frac{1}{n} = \frac{1}{a} - \frac{1}{b}$. We have already $k = \frac{1}{a} - \frac{1}{r}$; and $\frac{1}{\varphi} = \frac{1}{a} - \frac{1}{ma} + \frac{1}{mr}$; and $l = \frac{1}{b} - \frac{1}{\varphi} = \frac{1}{b} - \frac{1}{a} + \frac{1}{ma} - \frac{1}{mr}$. Now for $\frac{1}{b} - \frac{1}{a}$ write $-\frac{1}{n}$, and we get $l = \frac{1}{ma} - \frac{1}{mr} - \frac{1}{n}$. Therefore $\frac{1}{f} = \frac{1}{b} - ml$ (by construction, page 347. Prop. II.) becomes $= \frac{1}{b} - \frac{1}{a} + \frac{1}{r} + \frac{m}{n} = \frac{m}{n} + \frac{1}{r} - \frac{1}{a} = \frac{m-1}{n} + \frac{1}{r}$.

This last value of $\frac{1}{f}$ (the reciprocal of the focus of a slender pencil twice refracted), viz. $\frac{m-1}{n} + \frac{1}{r}$, is the simplest that can be imagined, and makes n as a substitute for $\frac{1}{a} - \frac{1}{b}$; a most useful symbol, as we shall frequently find in the sequel. It also gives a very simple expression of the focal distance of parallel rays, which we may call the principal focal distance of the lens, and distinguish it in future by the symbol p ; for the expression $\frac{1}{f} = \frac{m-1}{n} + \frac{1}{r}$, becomes $\frac{1}{p} = \frac{m-1}{n}$ when the incident light is parallel. And this gives us another very simple and useful measure of f ; for $\frac{1}{f}$ becomes $= \frac{1}{p} + \frac{1}{r}$. These equations $\frac{1}{f} = \frac{m-1}{n} + \frac{1}{r}$, $\frac{1}{p} = \frac{m-1}{n}$, and $\frac{1}{f} = \frac{1}{p} + \frac{1}{r}$, deserve therefore to be made very familiar to the mind.

We may also take notice of another property of n . It is half the radius of an isosceles lens, which is equivalent to the lens whose radii are a and b : for suppose the lens to be isosceles, that is, $a = b$; then $n = \frac{1}{a} - \frac{1}{a}$. Now the second a is negative if the first be positive, or positive if the first be negative. Therefore $\frac{1}{a} - \frac{1}{b} = \frac{1+b}{a^2} = \frac{a+a}{a^2} = \frac{2}{a}$, and $\frac{1}{n} = \frac{2}{a}$, and $n = \frac{a}{2}$. Now the focal distance of this lens is $\frac{m-1}{n}$, and so is that of the other, and they are equivalent.

But, to proceed with our investigation, recollect that we had $\theta = \frac{m-1}{m^2} \left(k^3 - \frac{mk^2}{r} \right) \frac{e^2}{2}$. Therefore $m\theta = \frac{m-1}{m} \left(\frac{k^3}{m} - \frac{k^2}{r} \right) \frac{e^2}{2}$. And θ' was $= \frac{m-1}{m} \left(-m^3l^3 + \frac{m^2l^2}{\varphi} \right) \frac{e^2}{2}$. Therefore $m\theta + \theta'$, the aberration (neglecting the thickness of the lens) is $f^2 \frac{m-1}{m} \left(\frac{k^3}{m} - \frac{k^2}{r} - m^3l^3 + \frac{m^2l^2}{\varphi} \right) \frac{e^2}{2}$.

If we now write for $k, l,$ and r , their values as determined above, performing all the necessary multiplications, and arrange the terms in such a manner as to collect in one sum the coefficients of $a, n,$ and r , we shall find 4 terms for the value of $m\theta$, and 10 for the value of θ' . The 4 are destroyed by as many with contrary signs in the value of θ' , and there remain 6 terms to express the value of $m\theta + \theta'$, which we shall express by one symbol q ; and the equation stands thus:

$$q = \frac{m-1}{m} \left(\frac{m^3}{n} - \frac{2m^2+m}{an^2} + \frac{m+2}{a^2n} + \frac{3m^2+m}{rn^2} - \frac{4n+4}{arn} + \frac{3m+2}{r^2n} \right) \frac{e^2}{2}$$

The focal distance therefore of rays twice refracted, reckoned from the last surface, or BI, corrected for aberration, and for the thickness of the lens, is $f - f^2 \frac{m\alpha}{\varphi^2} - f^2 q$, consisting of three parts, viz. f , the focal distance of central rays; $f^2 \frac{m\alpha}{\varphi^2}$, the correction for the thickness of the lens; and $f^2 q$, the aberration.

The formula in the 2d par. of this col. appears very complex, but is of very easy management, requiring only the preparation of the simple numbers which form the numerators of the fractions included in the parenthesis. When the incident rays are parallel, the terms vanish which have r in the denominator, so that only the three first terms are used.

We might here point out the cases which reduce the aberration expressed in the formula last referred to, to nothing; but as they can scarcely occur in the object-glass of a telescope, we omit it for the present, and proceed to the combination of two or more lenses.

Lemma 3. If AG be changed by a small quantity Gg, BI suffers a change Ii, and $Gg : Ii = AG^2 : BI^2$. For it is well known that the small angles GMg and INi are equal; and therefore their subtenses Gk, In are proportional to MG, NI, or to AG, AI nearly, when the aperture is moderate. Therefore we have (nearly)

$$\begin{aligned} Gk : In &:: AG : BI \\ In : Ii &:: AM : BI \\ Gg : Gk &:: AG : AM \end{aligned}$$

$$\text{Therefore } Gg : Ii = AG^2 : BI^2$$

PROP. III. To determine the focal distance of rays refracted by two lenses placed near to each other on a common axis.

Let AM, BN (fig. 8.) be the surfaces of the first lens, and CO, DP be the surfaces of the second, and let s be the thickness of the second lens, and δ the interval between them. Let the radius of the anterior surface of the second lens be a' , and the radius of its posterior surface be b' . Let m' be to 1 as the sine of incidence to the sine of refraction in the substance of the second lens. Lastly, let p' be the principal focal distance of the second lens. Let the extreme or marginal ray meet the axis in L after passing thro' both lenses, so that DL is the ultimate focal distance, reckoned from the last surface.

It is plain that DL may be determined by means of a', b', m', p' , and CI, in the same manner that BI was determined by means of a, b, m, p , and AG.

The value of BI is $f - m \alpha \frac{f^2}{r^2} - f^2 q$. Take from this the interval δ , and we have $CI = f - m \alpha \frac{f^2}{r^2} - \delta - f^2 q$.

Let the small part $- m \alpha \frac{f^2}{r^2} - \delta - f^2 q$ be neglected for the present, and let CI be supposed $= f$. As we formed $\varepsilon, f,$ and q , by means of $a, b, m, n,$ and r , let us now form $\varepsilon', f',$ and q' , for the second lens, by means of $a', b', m', n',$ ($= \frac{1}{a'} - \frac{1}{b'}$), and r' . r' will be the focal distance of a slender pencil refracted by the first surface, f' will be the focal distance of this pencil after two refractions, and q' will be the coefficient of the aberration, neglecting the thickness and interval of the lenses.

Proceeding in this way, DL will be $= f' - m' \alpha' \frac{f'^2}{r'^2} - f'^2 q'$. But because CI is really less than f , by the quantity $m \alpha \frac{f^2}{r^2} + \delta + f^2 q$, we must (by Lemma 3.) subtract the product of this quantity, multiplied by $\frac{DL}{BI^2}$, (which is nearly $\frac{f'^2}{f^2}$), from $f' - m' \alpha' \frac{f'^2}{r'^2} - f'^2 q'$.

By this process we shall have

$$DL = f' - f^2 \left(\frac{m \alpha}{r^2} + \frac{\delta}{f^2} + \frac{m' \alpha'}{r'^2} \right) - f^2 (q + q').$$

The first term f' of this value of DI is the focal distance of a slender pencil of central rays refracted by both lenses, neglecting their thickness and distance; the second term, $-f^2 \left(\frac{m \alpha}{r^2} + \frac{\delta}{f^2} + \frac{m' \alpha'}{r'^2} \right)$ is the correction necessary for these circumstances; and the third term, $-f^2 (q + q')$, is the correction for the aperture $2e$. And it is evident that q' is a formula precisely similar to q , containing the same number of terms, and differing only by the $m', a, n',$ and r' , employed in place of $m, a, n,$ and r .

It is also evident, that if there be a third lens, we shall obtain its focal distance by a process precisely similar to that by which we obtained DL; and so on for any number of lenses.

Thus we have obtained formulæ by which the foci of rays are determined in the most general terms; and in such a manner as shall point out the connection of the curvatures, thicknesses, and distances of the lenses, with their spherical aberrations, and with the final aberration of the compound lens, and give the aberrations in separate symbols, so that we can treat them by themselves, and subject them to any conditions which may enable us to correct one of them by another.

We also see in general, that the correction for the thickness and distance of the lenses are exhibited in terms which involve only the focal distances of central rays, and have very little influence on the aberrations, and still less on the ratio of the aberrations of the different lenses. This is a most convenient circumstance; for we may neglect them while we are determining q and q' , and in determining the ratio of the focal distances of the several lenses, on which the correction of the chromatic aberration chiefly depends. Therefore, in the construction of a compound lens for uniting the different colours, we may neglect this correction or the thickness and distance till the end of the process. When we apply it, we shall find that it chiefly affects the focal distance, making it somewhat longer, but has hardly any influence either on the chromatic or spherical aberration. We do not hesitate to say, that the final formulæ here given are abundantly accurate, while they are

very more manageable than those employed by Euler or ^{Telescope} D'Alembert. We have calculated trigonometrically the progress of the rays through one of the glasses, which will be given as an example, giving it a very extravagant aperture, that the errors of the formulæ might be very remarkable. We found the real aberration exceed the aberration assigned by the formula by no more than $\frac{1}{3}$ th part, a difference which is quite insignificant. The process here given derives its simplicity from the frequent occurrence of harmonic proportions in all optical theorems. This enabled Mr Clairaut to employ the reciprocals of the radii and distances with so much simplicity and generality.

We consider it as another advantage of Mr Clairaut's method, that it gives, by the way, formulæ for the more ordinary questions in optics, which are of wonderful simplicity, and most easily remembered. The chief problems in the elementary construction of optical instruments relate to the focal distances of central rays; this determines the focal distances and arrangement of the glasses. All the rest may be called the refinement of optics; teaching us how to avoid or correct the indistinctness, the colours, and the distortions, which are produced in the images formed by these simple constructions. We shall mention a few of these formulæ which occur in our process, and tend greatly to abbreviate it when managed by an experienced analyst.

Let m be to 1 as the sine of incidence to the sine of refraction; let a and b be the radii of the anterior and posterior surfaces of a lens; let r be the distance of the radiant point, or the focus of incident central rays, and f the distance of the conjugate focus; and let ρ be the principal focal distance of the lens, or the focal distance of parallel rays.

Make $\frac{1}{n}$ equal to $\frac{1}{a} - \frac{1}{b}$; let the same letters $a', b', r',$ &c. express the same things for a second lens; and $a'', b'', r'',$ &c. express them for a third; and so on. Then we have $\frac{1}{f} = \frac{m-1}{n} + \frac{1}{r}$; $\frac{1}{f'} = \frac{m'-1}{n'} + \frac{1}{r'}$; $\frac{1}{f''} = \frac{m''-1}{n''} + \frac{1}{r''}$, &c.

Therefore when the incident light is parallel, and r infinite, we have $\frac{1}{\rho} = \frac{m-1}{n}$; $\frac{1}{\rho'} = \frac{m'-1}{n'}$; $\frac{1}{\rho''} = \frac{m''-1}{n''}$, &c.

And when several lenses are contiguous, so that their intervals may be neglected, and therefore $\frac{1}{f}$, belonging to the first lens, becomes $\frac{1}{r}$, belonging to the second, we have

1. $\frac{1}{r'} = \frac{1}{f} = \frac{m-1}{n} + \frac{1}{r} = \frac{1}{\rho} + \frac{1}{r}$.
2. $\frac{1}{r''} = \frac{1}{f'} = \frac{m'-1}{n'} + \frac{m-1}{n} + \frac{1}{r} = \frac{1}{\rho'} + \frac{1}{\rho} + \frac{1}{r}$.
3. $\frac{1}{f''} = \frac{m''-1}{n''} + \frac{m'-1}{n'} + \frac{m-1}{n} + \frac{1}{r} = \frac{1}{\rho''} + \frac{1}{\rho'} + \frac{1}{\rho} + \frac{1}{r}$.

Nothing can be more easily remembered than these formulae, how numerous so ever the glasses may be.

Having thus obtained the necessary analysis and formulae, it now remains to apply them to the construction of achromatic lenses; in which it fortunately happens, that the employment of several surfaces, in order to produce the union of the differently refrangible rays, enables us at the same time to employ them for correcting each other's spherical aberration.

In the article OPTICS we gave a general notion of the principle on which we may proceed in our endeavours to unite the differently refrangible rays. A white or compounded ray is separated by refraction into its component coloured rays, and they are diffused over a small angular space. Thus it appears, that the glass used by Sir Isaac

Telescope

Telescope

Newton in his experiments difused a white ray, which was incident on its posterior surface in an angle of 30° , in such a manner that the extreme red ray emerged into air, making an angle of $50^\circ 21\frac{1}{2}'$ with the perpendicular; the extreme violet ray emerged in an angle of $51^\circ 15\frac{1}{2}'$; and the ray which was in the confines of green and blue, emerged in an angle of $50^\circ 48\frac{1}{2}'$. If the sine of the angle 30° of incidence be called 0,6, which it really is, the sine of the emergence of the red ray will be 0,77; that of the violet ray will be 0,78; and that of the intermediate ray will be 0,774, an exact mean between the two extremes. This ray may therefore be called the mean refrangible ray, and the ratio of 774 to 100, or of 1,55 to 1, will very properly express the mean refraction of this glass; and we have for this glass $m = 1,55$. The sine of refraction, being measured on a scale, of which the sine of incidence occupies 100 parts, will be 154 for the red ray, 155 for the mean ray, and 156 for the violet ray. This number, or its ratio to unity, is commonly taken to represent the refractive power of the glass. There is some impropriety in this, unless we consider ratios as measured by their logarithms: for if m be 1, the substance does not refract at all. The refractive power can be properly measured only by the refraction which it produces; that is, by the change which it makes in the direction of the light, or the angle contained between the incident and refracted rays. If two substances produce such deviations always in one proportion, we should then say that their refractive powers are in that proportion. This is not true in any substances; but the sines of the angles, contained between the refracted ray and the perpendicular, are always in one proportion when the angle of incidence in both substances is the same. This being a considerable function of the real refraction, has therefore been assumed as the only convenient measure of the refractive powers. Although it is not strictly just, it answers extremely well in the most usual cases in optical instruments: the refractions are moderate; and the sines are very nearly as the angles contained between the rays and the perpendicular; and the real angles of refraction, or deflections of the rays, are almost exactly proportional to $m - 1$. The most natural and obvious measure of the refractive powers would therefore be $m - 1$. But this would embarrass some very frequent calculations; and we therefore find it best, on the whole, to take m itself for the measure of the refractive power.

The separation of the red, violet, and intervening rays, has been called *dispersion*; and although this arises merely from a difference of the refractive power in respect of the different rays, it is convenient to distinguish this particular modification of the refractive power by a name, and we call it the **DISPERSIVE POWER** of the refracting substance.

It is susceptible of degrees; for a piece of flint-glass will refract the light, so that when the sine of refraction of the red ray is 77, the sine of the refraction of the violet ray is nearly 784; or if the sine of refraction of the red ray, measured on a particular scale, is 1,54, the sine of refraction of the violet ray is 1,57. The dispersion of this substance, being measured by the difference of the extreme sines of refraction, is greater than the dispersion of the other glass, in the proportion of 3 to 2.

But this alone is not a sufficient measure of the absolute dispersive power of a substance. Although the ratio of 1,54 to 1,56 remains constant, whatever the real magnitude of the refractions of common glass may be, and though we therefore say that its dispersive power is constant, we know, that by increasing the incidence and the refraction, the absolute dispersion is also increased. Another substance shows the same properties, and in a particular case may produce

the same dispersion; yet it has not for this sole reason the same dispersive power. If indeed the incidence and the refraction of the mean ray be also the same, the dispersive power cannot be said to differ; but if the incidence and the refraction of the mean ray be less, the dispersive power must be considered as greater, though the actual dispersion be the same; because if we increase the incidence till it becomes equal to that in the common glass, the dispersion will now be increased. The proper way of conceiving the dispersion therefore is, to consider it as a portion of the whole refraction; and if we find a substance making the same dispersion with half the general refraction, we must say that the dispersive quality is double; because by making the refraction equal, the dispersion will really be double.

If therefore we take m as a symbol of the separation of the extreme rays from the middle ray, $\frac{m}{m-1}$ is the natural measure of the dispersive power. We shall express this in the Leibnitzian notation, thus $\frac{dm}{m-1}$, that we may avoid the indistinctness which the Newtonian notation would occasion when m is changed for m' or m'' .

It is not unusual for optical writers to take the whole separation of the red and violet rays for the measure of the dispersive power, and to compare this with the refracting power with respect to one of the extreme rays. But it is surely better to consider the mean refraction as the measure of the refracting power; and the deviation of either of the extremes from this mean is a proper enough measure of the dispersion, being always half of it. It is attended with this convenience, that being introduced into our computations as a quantity infinitely small, and treated as such for the ease of computation, while it is really a quantity of sensible magnitude; the errors arising from this supposition are diminished greatly, by taking one half of the deviation and comparing it with the mean refraction. This method has, however, this inconvenience, that it does not exhibit at once the refractive power in all substances respecting any particular colour of light; for it is not the ray of any particular colour that suffers the mean refraction. In common glass it is the ray which is in the confines of the yellow and blue; in flint glass it is nearly the middle blue ray; and in other substances it is a different ray. These circumstances appear plainly in the different proportions of the colours of the prismatic spectrum exhibited by different substances. This will be considered afterwards, being a great bar to the perfection of achromatic instruments.

The way in which an achromatic lens is constructed is, to make use of a contrary refraction of a second lens to destroy the dispersion or spherical aberration of the first.

The first purpose will be answered if $\frac{dm}{n}$ be equal to to $-\frac{dm'}{n'}$. For, in order that the different coloured rays may be collected into one point by two lenses, it is only necessary that $\frac{1}{f'}$, the reciprocal of the focal distance of rays refracted by both, may be the same for the extreme and mean rays, that is, that $\frac{m + dm - 1}{n} + \frac{m' + dm' - 1}{n'}$ $+$ $\frac{1}{r}$ be of the same value with $\frac{m - 1}{n} + \frac{m' - 1}{n'} + \frac{1}{r}$; which must happen if $\frac{dm}{n} + \frac{dm'}{n'}$ be $= 0$, or $\frac{dm}{n} = -\frac{dm'}{n'}$. This may be seen in another way, more comprehensible by such as are not versant in these discussions. In order

der that the extreme colours which are separated by the first lens may be rendered parallel by the second; we have shown already that n and n' are proportional to the radii of the equivalent isosceles lenses, being the halves of these radii. They are therefore (in these small refractions) inversely proportional to the angles formed by the surfaces at the edges of the lenses. n' may therefore be taken for the angle of the first lens, and n for that of the second. Now the small refraction by a prism, whose angle (also small) is n' , is $m - 1 \times n'$. The dispersive power being now substituted for the refractive power, we have for this refraction of the prism $dm \times n'$. This must be destroyed by the opposite refraction of the other prism $dm' \times n$. Therefore $dm \times n' = dm' \times n$, or $\frac{dm}{n} = -\frac{dm'}{n}$. In like manner, this effect will be produced by three lenses if $\frac{dm}{n} + \frac{dm'}{n'} + \frac{dm''}{n''} = 0$, &c.

Lastly, the errors arising from the spherical figure, which we expressed by $-R^2(q + q')$ will be corrected if $q + q' = c$. We are therefore to discover the adjustments of the quantities employed in the preceding formulæ, which will insure these conditions. It will render the process more perspicuous if we collect into one view the significations of our various symbols, and the principal equations which we are to employ.

- 1. The ratios to unity of the sines of mean incidence in the different media are m, m', m''
- 2. The ratio of the differences of the sines of the extremes $\frac{dm}{dm'} = u$.
- 3. The ratio $\frac{m-1}{m'-1} = c$.
- 4. The radii of the surfaces $a, b; a', b'; a'', b''$.
- 5. The principal focal distances, or the focal distances of parallel central rays, f, f', f'' .
- 6. The focal distance of the compound lens P .
- 7. The distance of the radiant point, or of the focus of incident rays on each lens r, r', r'' .
- 8. The focal distance of the rays refracted by each lens f, f', f'' .
- 9. The focal distance of rays refracted by the compound lens P .
- 10. The half breadth of the lens e .

Also the following subsidiary values:

- 1. $\frac{1}{n} = \frac{1}{a} - \frac{1}{b}; \frac{1}{n'} = \frac{1}{a'} - \frac{1}{b'}; \frac{1}{n''} = \frac{1}{a''} - \frac{1}{b''}$.
- 2. $q = \frac{m-1}{m} \left(\frac{m^2}{n^3} - \frac{2m^2+m}{an^2} + \frac{m+2}{a^2n} + \frac{2m^2+m}{rn^2} - \frac{4(m+1)}{arn} + \frac{3m+2}{r^2n} \right) \frac{e^2}{2}$. And q' and q'' must be formed in the same manner from m', a', n', r' ; and from m'', a'', n'', r'' , as q is formed from m, a, n, r .
- 3. Also, because in the case of an object-glass, r is infinitely great, the last term $\frac{1}{r}$ in all the values of $\frac{1}{f}, \frac{1}{f'}, \frac{1}{f''}, \frac{1}{P}, \frac{1}{r}, \frac{1}{r'}$, will vanish, and we shall also have $F = P$.

Therefore in a double object-glass $\frac{1}{P} = \frac{m'-1}{n'} + \frac{m-1}{n}$, $= \frac{1}{p} + \frac{1}{p'}$.

And in a triple object-glass $\frac{1}{P} = \frac{m''-1}{n''} + \frac{m'-1}{n'} + \frac{m-1}{n}$, $= \frac{1}{p''} + \frac{1}{p'} + \frac{1}{p}$.

Also, in a double object-glass, the correction of spherical aberration requires $q + q' = v$.

And a triple object-glass requires $q + q' + q'' = v$. For the whole error is multiplied by F^2 , and by $\frac{1}{2}e^2$; and therefore the equation which corrects this error may be divided by $F^2 \frac{1}{2}e^2$.

This equation in the preceding column, 11th line from the bottom, giving the value of q, q', q'' , may be much simplified as follows: In the first place, they may be divided by m, m' , or m'' , by applying them properly to the terms within the parenthesis, and expunging them from the denominator of the general factors $\frac{m-1}{m}, \frac{m'-1}{m'}, \frac{m''-1}{m''}$. This does not alter the values of q, q' , and q'' . In the second place the whole equations may be afterwards divided by $m-1, m'-1, m''-1$. This will give the values of $\frac{q}{m-1}, \frac{q'}{m'-1},$ and $\frac{q''}{m''-1}$, which will still be equal to nothing if $q + q' + q''$ be equal to nothing.

This division reduces the general factor $\frac{m-1}{m}$ of q' to $\frac{1}{m'}$. And in the equation for q we obtain, in place of the general factor $\frac{m-1}{m}$, the factor $\frac{m-1}{m'-1}$, or c . This will also be the factor of the value of q'' when the third lens is of the same substance with the first, as is generally the case. And, in the third place, since the rays incident on the first lens are parallel, all the terms vanish from the value of q in which $\frac{1}{r}$ is found, and there remain only the three first,

$$viz. \frac{m^3}{n^3} - \frac{2m^2+m}{an^2} + \frac{m+2}{a^2n}$$

Performing these operations, we have $\frac{q}{m-1} = c \left(\frac{m^2}{n^3} - \frac{2m+1}{an^2} + \frac{m+2}{ma^2n} \right) \frac{e^2}{2}$. $\frac{q'}{m'-1} = \left(\frac{m'^2}{n'^3} - \frac{2m'+1}{a'n'^2} + \frac{m'+2}{n'a^2n'} + \frac{3m'+1}{r'n'^2} - \frac{4(m'+1)}{m'a'r'n'} + \frac{3m'+2}{m'r^2n'} \right) \frac{e^2}{2}$. $\frac{q''}{m''-1} = c \left(\frac{m''^2}{n''^3} - \frac{2m''+1}{a''n''^2} + \frac{m''+2}{m''a''n''} + \frac{3m''+1}{r''n''^2} + \frac{4(m''+1)}{m''a''r''n''} + \frac{3m''+2}{m''r''^2n''} \right) \frac{e^2}{2}$.

Let us now apply this investigation to the construction of an object-glass; and we shall begin with a double lens.

Construction of a Double Achromatic Object-glass.

Here we have to determine four radii a, b, a', b' . Make $n=1$. This greatly simplifies the calculus, by exterminating it from all the denominators. This gives for the equation $\frac{dm}{n} + \frac{dm'}{n'} = c$, the equation $dm + \frac{dm'}{n'} = c$, or $dm = -\frac{dm'}{n'}$, and $\frac{1}{n} = -\frac{dm}{dm'} = -u$. Also we have r' , the focal distance of the light incident on the second lens, the same with the principal focal distance p of the first lens (neglecting the interval, if any). Now $\frac{1}{p} = \frac{m-1}{n}$, which in the present case is $= m-1$. Also $\frac{1}{p'}$ is $= -u(m'-1)$, and $\frac{1}{P} = m-1-u(m'-1) = u'$.

Make these substitutions in the values of $\frac{q}{m-1}$ and $\frac{q'}{m'-1}$, and we obtain the following equation:

$$c m' \frac{c(2m+1)}{a} + \frac{c(m+2)}{m a^2} - u^3 m'^2 - \frac{u^2(2m'+1)}{a} - \frac{u(m'+2)}{m a'^2} + u^2(3m'+1)(m-1) + \frac{4u(m'+1)(m-1)}{m a'} - \frac{u(3m'+2)(m-1)^2}{m'} = 0.$$

Arrange these terms in order, according as they are factors of $\frac{1}{a^2}$, $\frac{1}{a}$, $\frac{1}{a^2}$, $\frac{1}{a}$, or independent quantities. It puts on this form:

$$c \frac{(m+2)}{m} \times \frac{1}{a^2} - c'(2m+1) \times \frac{1}{a} - \frac{u(m'+2)}{m'} \times \frac{1}{a^2} - (u^2(2m'+1) - \frac{4u(m'+1)(m-1)}{m'}) \times \frac{1}{a} + c m^2 + u^2(3m'+1)(m-1) - u^3 m'^2 - \frac{u(3m'+2)(m-1)^2}{m'} = 0.$$

Let A be the coefficient of $\frac{1}{a^2}$, B that of $\frac{1}{a}$, C that of $\frac{1}{a^2}$, D that of $\frac{1}{a}$, and E the sum of the independent quantity; that is, let A be $= \frac{c(m+2)}{m}$, B = $c(2m+1)$, C = $\frac{u(m'+2)}{m'}$, D = $u^2(2m'+1) - \frac{4u(m+1)(m-1)}{m}$, and E = $c m^2 + u^2(3m'+1)(m-1) - u^3 m'^2 - \frac{u(3m'+2)(m-1)^2}{m'}$.

Our final equation becomes

$$\frac{A}{a^2} - \frac{B}{a} - \frac{C}{a^2} - \frac{D}{a} + E = 0.$$

The coefficients of this equation and the independent quantity are all known, from our knowledge of m, m', d, m, d, m ; and we are to find the values of a and a' , and from them and $n = 1$ to find the values of b and b' .

But it is evidently an indeterminate equation, because there are two unknown quantities; so that there may be an infinity of solutions. It must be rendered determinate by means of some other conditions to which it may be subjected. These conditions must depend on some other circumstances which may direct our choice.

One circumstance occurs to us which we think of very great consequence. In the passage of light from one substance to another, there is always a considerable portion reflected from the posterior surface of the first and from the anterior surface of the last; and this reflection is more copious in proportion to the refraction. This loss of light will therefore be diminished by making the internal surfaces of the lenses to coincide; that is, by making $b = a'$. This will be attended with another advantage. If we put between the glasses a substance of nearly the same refracting power, we shall not only completely prevent this loss of light, but we shall greatly diminish the errors which arise from an imperfect polish of the surfaces. We have tried this, and find the effect very surprising. The lens being polished immediately after the figure has been given it, and while it was almost impervious to light by reason of its roughness, which was still sensible to the naked eye, performed as well as when finished in the finest manner.

A. B. This condition, by taking away one refraction, obliges us to increase those which remain, and therefore increases the spherical aberrations. And since our formulæ do not fully remove those (by reason of the small quantities neglected in the process), it is uncertain whether this condition be the most eligible. We have, however, no direct argument to the contrary.

Let us see what determination this gives us.

In this case $\frac{1}{a'} = \frac{1}{b}$, $= \frac{1}{a} - L$. For because $\frac{1}{n} = \frac{1}{a} - \frac{1}{b}$ and $n = 1$, we have $1 + \frac{1}{b} = \frac{1}{a}$, and $\frac{1}{b} = \frac{1}{a} - 1$. Therefore $\frac{1}{a^2} = \frac{1}{a^2} - \frac{2}{a} + 1$. Therefore, in our final equation, put $\frac{1}{a^2} - \frac{2}{a} + 1$ in place of $\frac{1}{a^2}$, and $\frac{1}{a} - 1$ in place of $\frac{1}{a}$, and it becomes $\frac{A-C}{a^2} - \frac{B+D-2C}{a} + E - D - C = 0$.

Thus have we arrived at a common affected quadratic equation, where $\frac{1}{a}$ is the unknown quantity. It has the common form $p x^2 + q x + r = 0$, where p is $= A-C$, q is equal to $2C-B-D$, r is equal to $E+D-C$, and x is equal to $\frac{1}{a}$.

Divide the equation by p , and we have $x^2 + \frac{q}{p} x + \frac{r}{p} = 0$. Make $s = \frac{q}{p}$ and $t = \frac{r}{p}$, and we have $x^2 + s x + t = 0$.

This gives us finally $\frac{1}{a}$, or $x = -\frac{1}{2} s \pm \sqrt{\frac{1}{4} s^2 - t}$.

This value of $\frac{1}{a}$ is taken from a scale of which the unit is half the radius of the isofceles lens which is equivalent to the first lens, or has the same focal distance with it. We must then find (on the same scale) the value of b , viz. $\frac{1}{a} - 1$, which is also the value of a' . Having obtained a' , we must find b' by means of the equation $\frac{1}{n'} = \frac{1}{a'} - \frac{1}{b'}$, and therefore $\frac{1}{b'} = \frac{1}{a'} - \frac{1}{n'}$. But $\frac{1}{n'} = u$. Therefore $\frac{1}{b'} = \frac{1}{a'} + u = \frac{1}{a} + u - 1$.

Thus is our object glass constructed; and we must determine its focal distance, or its reciprocal $\frac{1}{F}$. This is $= m - 1 - u(m' - 1)$.

All these radii and distances are measured on a scale of which n is the unit. But it is more convenient to measure every thing by the focal distance of the compound object-glass. This gives us the proportion which all the distances bear to it. Therefore, calling P unity, in order to obtain $\frac{1}{a}$ on this scale, we have only to state the analogy $m - 1 - u(m' - 1) : 1 = \frac{1}{a} : \frac{1}{A}$, and A is the radius of our first surface measured on a scale of which P is the unit.

It, in the formula which expresses the final equation for $\frac{1}{a}$, the value of t should be positive, and greater than $\frac{1}{4} s^2$, the equation has imaginary roots; and it is not possible with the glasses employed, and the conditions assumed, to correct both the chromatic and spherical aberrations.

If t is negative and equal to $\frac{1}{4} s^2$, the radical part of the value is $= 0$, and $\frac{1}{a} = -\frac{1}{2} s$. But if it be negative or positive, but less than $\frac{1}{4} s^2$, the equation has two real roots, which will give two constructions. That is to be preferred which gives the smallest curvature of the surfaces; because, since in our formulæ which determine the spherical aberration some quantities are neglected, these quantities are always

Telescope. ways greater when a large arch (that is, an arch of many degrees) is employed. No radius should be admitted which is much less than $\frac{1}{4}$ of the focal distance.

All this process will be made plain and easy by an example.

Very careful experiments have shown, that in common crown-glass the sine of incidence is to the sine of refraction as 1,526 is to 1, and that in the generality of flint-glass it is as 1,604 to 1. Also that $\frac{d m'}{d m} = 0,6054 = u$. Therefore $m - 1 = 0,526$; $m' - 1 = 0,604$; $c = \frac{m - 1}{m' - 1} = 0,87086$. By these numbers we can compute the coefficients of our final equation. We shall find them as follows:

- A = 2,012
- B = 3,529
- C = 1,360
- D = -0,526
- E = 1,8659

The general equation (p. 352. l. 17.), when subjected to the assumed coincidence of the internal surfaces, is $\frac{A - C}{a^2} - \frac{B + D - 2C}{a} + E + D - C = 0$. $A - C$ is = 0,652; $B + D - 2C$ is = 0,283; and $E + D - C$ is = -0,020; and the equation with numerical coefficients is $\frac{0,652}{a^2} - \frac{0,283}{a} - 0,020 = 0$, which corresponds to the equation $p x^2 + q x + r = 0$. We must now make $s = \frac{q}{p} = \frac{0,283}{0,652} = 0,434$, and $t = \frac{r}{p} = \frac{0,02}{0,652} = 0,0307$. This gives us the final quadratic equation $\frac{1}{a^2} - \frac{0,434}{a} - 0,0307 = 0$. To solve this, we have $-\frac{1}{2}s = 0,217$, and $\frac{1}{4}s^2 = 0,0471$. From this take t , which is = -0,0307 (that is, to 0,0471 add 0,0307), and we obtain 0,0778, the square root of which is = 0,2789. Therefore, finally, $\frac{1}{a} = 0,2170 \pm 0,2789$, which is either 0,4959 or -0,0619. It is plain that the first must be preferred, because the second gives a negative radius, or makes the first surface of the crown-glass concave. Now as the convergence of the rays is to be produced by the crown-glass, the other surface must become very convex, and occasion great errors in the computed aberration. We therefore retain 0,4959 for the value of $\frac{1}{a}$, and a is = $\frac{1}{0,4959} = 2,0166$.

To obtain b , use the equation $\frac{1}{b} = \frac{1}{a} - 1$, which gives $\frac{1}{b} = -0,5041$, and therefore a convex surface. b is therefore = $\frac{1}{0,5041} = 1,9837$.

a' is the same with b , and $\frac{1}{a'} = -0,5041$.

To obtain b' , use the equation $\frac{1}{b'} = \frac{1}{a} + u$. Now $u = 0,6054$, and $\frac{1}{a} = -0,5041$. The sum of these is 0,1013; and since it is positive, the surface is concave. $b' = \frac{1}{0,1013} = 9,872$.

Telescope. Lastly, $\frac{1}{P} = m - 1 - u(m' - 1) = 0,1603$, and $P =$

$$\frac{1}{0,1603} = 0,2383.$$

Now to obtain all the measures in terms of the focal distance P , we have only to divide the measures already found by 6,2383, and the quotients are the measures wanted.

Therefore $a = \frac{2,0166}{6,2383} = 0,32325$

$b = \frac{1,9837}{6,2383} = -0,31798$

$a' = \dots = -0,31798$

$b' = \frac{9,872}{6,2383} = 1,5825$

$P = \dots = 1$.

If it be intended that the focal distance of the object-glass shall be any number n of inches or feet, we have only to multiply each of the above radii by n , and we have their lengths in inches or feet.

Thus we have completed the investigation of the construction of a double object-glass. Although this was intricate, the final result is abundantly simple for practice, especially with the assistance of logarithms. The only troublesome thing is the preparation of the numerical coefficients A, B, C, D, E of the final equation. Strict attention must also be paid to the positive and negative signs of the quantities employed.

We might propose other conditions. Thus it is natural to prefer for the first or crown-glass lens such a form as shall give it the smallest possible aberration. This will require a small aberration of the flint-glass to correct it. But a little reflection will convince us that this form will not be good. The focal distance of the crown-glass must not exceed one-third of that of the compound glass; these two being nearly in the proportion of $d m' - d m$ to $d m'$. Therefore if this form be adopted, and a be made about $\frac{1}{3}$ th of b , it will not exceed $\frac{1}{3}$ th of P . Therefore, although we may produce a most accurate union of the central and marginal rays by opposite aberrations, there will be a considerable aberration of some rays which are between the centre and the margin.

It is absolutely impossible to collect into one point the whole rays (though the very remotest rays are united with the central rays), except in a very particular case, which cannot obtain in an object-glass; and the small quantities which are neglected in the formula which we have given for the spherical aberration, produce errors which do not follow any proportion of the aperture which can be expressed by an equation of a manageable form. When the aperture is very large, it is better not to correct the aberration for the whole aperture, but for about $\frac{1}{2}$ ths of it. When the rays corresponding to this distance are made to coincide with the central rays by means of opposite aberrations, the rays which are beyond this distance will be united with some of those which are nearer to the centre, and the whole diffusion will be considerably diminished. Dr Smith has illustrated this in a very perspicuous manner in his theory of his Catoptric Microscope.

But although we cannot adopt this form of an object-glass, there may be other considerations which may lead us to prefer some particular form of the crown glass, or of the flint-glass. We shall therefore adapt our general equation $\frac{A}{a^2} - \frac{B}{a} - \frac{C}{a'} - \frac{D}{a'} + E = 0$ to this condition.

Therefore let b express this selected ratio of the two radii of the crown-glass, making $\frac{a}{b} = b$ (remembering always that a is positive and b negative in the case of a double convex, and b is a negative number).

With this condition we have $\frac{1}{b} = \frac{b}{a}$. But when we make $\frac{1}{b}$ the unit of our formula of aberration, $\frac{1}{b} = \frac{1}{a} - 1$. Therefore $\frac{1}{a} = \frac{1}{b} + 1$, and $\frac{1}{a} = \frac{1}{1-b}$. Now substitute this for $\frac{1}{a}$ in the general equation, and change all the signs (which still preserves it = 0), and we obtain

$$\frac{C}{a^2} + \frac{D}{a} - E - \frac{A}{(1-b)^2} + \frac{B}{1-b} = 0.$$

By this equation we are to find $\frac{1}{a}$, or the radius of the anterior surface of the flint-glass. The equation is of this form $p x^2 + q x + r = 0$, and we must again make $s = \frac{q}{p}$, and $t = \frac{r}{p}$. Therefore $s = \frac{D}{C}$, and $t = \frac{1}{C} \times \left(\frac{B}{1-b} - \frac{A}{(1-b)^2} - E \right)$. Then, finally,

$$\frac{1}{a} = -\frac{1}{2} s \pm \sqrt{\frac{1}{4} s^2 - t}.$$

It may be worth while to take a particular case of this condition. Suppose the crown glass to be of equal convexities on both sides. This has some advantages: We can tell with precision whether the curvatures are precisely equal, by measuring the focal distance of rays reflected back from its posterior surface. These distances will be precisely equal. Now it is of the utmost importance in the construction of an object-glass which is to correct the spherical aberration, that the forms be precisely such as are required by our formulae.

In this case of a lens equally convex on both sides

$\frac{1}{a}$ is = $-\frac{1}{b}$, = $\frac{1}{2}$. Substitute this value for $\frac{1}{a}$ in the general equation $\frac{A}{a^2} - \frac{B}{a} - \frac{C}{a^2} - \frac{D}{a} + E = 0$, and

then $\frac{A}{a^2} = \frac{A}{4}$; $\frac{B}{a}$ becomes $\frac{B}{2}$. Now change all the signs, and we have $\frac{C}{a^2} + \frac{D}{a} - E - \frac{A}{4} + \frac{B}{2} = 0$, by which we

are to find a' . This in numbers is $\frac{1,360}{a^2} - \frac{0,526}{a} - 0,6044 = 0$. Then $s = \frac{-0,526}{1,360} = 0,3867$, and $t = \frac{-0,6044}{1,360} = -0,4444$. Then $-\frac{1}{2} s = 0,1933$; $\frac{1}{4} s^2 = 0,0374$;

and $\sqrt{\frac{1}{4} s^2 - t} = \pm 0,6941$; so that $\frac{1}{a} = 0,1933 \pm 0,6941$. This gives two real roots, viz. 0,8874, and -0,5008. If we take the first, we shall have a convex anterior surface for the flint-glass, and consequently a very deep concave for the posterior surface. We therefore take the second or negative root -0,5008.

We find $\frac{1}{b}$, as before, by the equation $\frac{1}{b} = \frac{1}{a} + u$, = 0,1046, which will give a large value of b .

We had $\frac{1}{a} = \frac{1}{2}$

and $\frac{1}{b} = -\frac{1}{2}$

and $\frac{1}{P}$ is the same as in the former case, viz. 0,1603.

Having all these reciprocals, we may find a, b, a', b' , and P ; and then dividing them by P , we obtain finally

$$\begin{aligned} a &= 0,3206 \\ b &= -0,3206 \\ a' &= 0,3201 \\ b' &= 1,533 \\ P &= 1, \end{aligned}$$

By comparing this object-glass with the former, we may remark, that diminishing a a little increases b , and in this respect improves the lens. It indeed has diminished b' , but this being already considerable, no inconvenience attends this diminution. But we learn, at the same time, that the advantage *must* be very small; for we cannot diminish a much more, without making it as small as the smallest radius of the object-glass. This proportion is therefore very near the maximum, or best possible; and we know that in such cases, even considerable changes in the radii will make but small changes in the result: for these reasons we are disposed to give a strong preference to the first construction, on account of the other advantages which we showed to attend it.

As another example, we may take a case which is very nearly the general practice of the London artists. The radius of curvature for the anterior surface of the convex crown-glass is $\frac{2}{3}$ this of the radius of the posterior surface, so that $b = \frac{2}{3}$. This being introduced into the determinate equation, gives

$$\begin{aligned} a &= 0,2938 & a' &= -0,3443 \\ b &= -0,3526 & b' &= 1,1474 \end{aligned}$$

As another condition, we may suppose that the second or flint-glass is of a determined form.

This case is solved much in the same manner as the former. Taking b to represent the ratio of a' and b' , we have $\frac{1}{a'}$

= $\frac{1}{1-b}$. This value being substituted in the general

equation $\frac{A}{a^2} - \frac{B}{a} - \frac{C}{a'^2} - \frac{D}{a} + E = 0$, gives us $\frac{A}{a^2}$

- $\frac{B}{a} + E - \frac{C}{(1-b)^2} - \frac{D}{1-b} = 0$. This gives for

the final equation $x^2 + s x + t = 0$, $s = \frac{B}{A}$, and $t = \frac{1}{A}$

$\times \left(E - \frac{C}{(1-b)^2} - \frac{D}{1-b} \right)$ and $\frac{1}{a} = -\frac{1}{2} s \pm$

$\sqrt{\frac{1}{4} s^2 - t}$.

We might here take the particular case of the flint-glass being equally concave on both sides. Then, because $\frac{1}{a'}$ =

$-u$, and in the case of equal concavities $\frac{2}{a} = \frac{1}{a'}$, = $-u$,

it is sufficient to put $-\frac{1}{2} u$ for $\frac{1}{a}$. This being done, the

equation becomes $\frac{A}{a} - \frac{B}{a} \frac{C u^2}{4} + \frac{D u}{2} + E = 0$. This

gives $s = \frac{B}{A}$, and $t = \frac{1}{A} \times \left(\frac{4 D u - 2 C u^2}{8} + E \right)$.

We

Telescope.

Telescope.

We imagine that these cases are sufficient for showing the management of the general equation; and the example of the numerical solution of the first case affords instances of the only niceties which occur in the process, viz. the proper employment of the positive and negative quantities.

We have oftener than once observed, that the formula is not perfectly accurate, and that in very large apertures errors will remain. It is proper therefore, when we have obtained the form of a compound object glass, to calculate trigonometrically the progress of the light through it; and if we find a considerable aberration, either chromatic or spherical, remaining, we must make such changes in the curvatures as will correct them. We have done this for the first example; and we find, that if the focal distance of the compound object-glass be 100 inches, there remains of the spherical aberration nearly $\frac{1}{35}$ th of an inch, and the aberration of colour is over corrected above $\frac{1}{3}$ th of an inch. The first aberration has been diminished about 6 times, and the other about 30 times. Both of the remaining errors will be diminished by increasing the radius of the inner surfaces. This will diminish the aberration of the crown-glass, and will diminish the dispersion of the flint more than that of the crown. But indeed the remaining error is hardly worth our notice.

It is evident to any person conversant with optical discussions, that we shall improve the correction of the spherical aberration by diminishing the refractions. If we employ two lenses for producing the convergency of the rays to a real focus, we shall reduce the aberration to $\frac{1}{4}$ th. Therefore a better achromatic glass will be formed of three lenses, two of which are convex and of crown-glass. The refraction being thus divided between them, the aberrations are lessened. There is no occasion to employ two concave lenses of flint-glass; there is even an advantage in using one. The aberration being considerable, less of it will serve for correcting the aberration of the crown-glass, and therefore such a form may be selected as has little aberration. Some light is indeed lost by these two additional surfaces; but this is much more than compensated by the greater apertures which we can venture to give when the curvature of the surface is so much diminished. We proceed therefore to

The Construction of a Triple Achromatic Object-glass.

It is plain that there are more conditions to be assumed before we can render this a determinate problem, and that the investigation must be more intricate. At the same time, it must give us a much greater variety of constructions, in consequence of our having more conditions necessary for giving the equation this determinate form. Our limits will not allow us to give a full account of all that may be done in this method. We shall therefore content ourselves with giving one case, which will sufficiently point out the method of proceeding. We shall then give the results in some other eligible cases, as rules to artists by which they may construct such glasses.

Let the first and second glasses be of equal curvatures on both sides; the first being a double convex of crown-glass, and the second a double concave of flint-glass.

Still making n the unit of our calculus, we have in the first place $a = -b, = -a', = b'$. Therefore $\frac{1}{a'} - \frac{1}{b'} = -\left(\frac{1}{a} - \frac{1}{b}\right)$, or $\frac{1}{n} = -\frac{1}{n} = -1$. Therefore the equation $\frac{d m}{n} + \frac{d m'}{n'} + \frac{d m''}{n''} = 0$ becomes $u - 1 + \frac{u}{n''} = 0$, or $\frac{1}{n} = \frac{1}{u} - 1$. Let us call this value u' .

We have $\frac{1}{\rho} = m - 1; \frac{1}{\rho'} = -(m' - 1); \frac{1}{\rho''} = u$
 $(m - 1); \frac{1}{\rho''} = \frac{1}{\rho} + \frac{1}{\rho'} + \frac{1}{\rho''} = m - m' + u' (m - 1)$.
 And if we make $m' - m = C$, we shall have $\frac{1}{\rho''} = -C + u' (m - 1)$. Also $\frac{1}{\rho'} = m - 1; \frac{1}{\rho''} = m - 1 - (m' - 1) = m - m', = -C'$.

The equality of the two curvatures of each lens gives $\frac{1}{a} = \frac{1}{2n}$. Therefore $\frac{1}{a} = -\frac{1}{b} = -\frac{1}{a'} = \frac{1}{b'} = \frac{1}{2}$; and $\frac{1}{b''} = \frac{1}{a} - \frac{1}{n''} = \frac{1}{a'} - u'$.

Substituting these values in the equation (p. 351. col. 2. par. 5.), we obtain the three formulæ,

1. $c m^2 - \frac{1}{2} c (2 m + 1) + \frac{c (m + 2)}{4 m}$
2. $-m' 2 + \frac{1}{2} (2 m' + 1) - \frac{m' + 2}{4 m'} + (3 m' + 1) (m - 1) - \frac{2 (m' + 1) (m - 1)}{(3 m' + 2) (m - 1)^2}$
3. $c u' 3 m^2 - \frac{c u'^2 (2 m + 1)}{a'} + \frac{c u' (m + 2)}{m a} - c u' u'^2 (3 m + 1) + \frac{4 c c' u' (m + 1)}{m a'} + \frac{c c'^2 u' (3 m + 2)}{m} = 0$.

Now arrange these quantities according as they are coefficients of $\frac{1}{a^2}$ and of $\frac{1}{a'}$, or independent quantities. Let the coefficient of $\frac{1}{a^2}$ be A, that of $\frac{1}{a'}$ be B, and the independent quantity be C, we have

$$A = \frac{c u' (m + 2)}{m}; B = c u'^2 (2 m + 1) - \frac{4 c c' u' (m + 1)}{m}$$

$$\text{and } C = c m^2 + \frac{c (m + 2)}{4 m} + \frac{1}{2} (2 m' + 1) + (3 m' + 1) (m - 1) + c u'^2 m^2 + \frac{c c'^2 u' (3 m + 2)}{m} - \frac{1}{2} c (2 m + 1) - m'^2 - \frac{m' + 2}{4 m} - \frac{2 (m' + 1) (m - 1)}{m'} - \frac{(3 m' + 2) (m - 1)^2}{m'} - c c' u'^2 (3 m + 1).$$

Our equation now becomes $\frac{A}{a^2} - \frac{B}{a} + C = 0$.

This reduced to numbers, by computing the values of the coefficients, is $\frac{1,312}{a'^2} - \frac{1,207}{a'} - 0,3257 = 0$.

This, divided by 1,312, gives $s = -0,92$; and $t = -0,2482$; $-\frac{1}{2} s = 0,46$; $\frac{1}{4} s^2 = 0,2116$; and $\sqrt{\frac{1}{4} s^2 - t} = \pm 0,6781$.

And, finally, $\frac{1}{a'} = 0,46 \pm 0,6781$.

This has two roots, viz. 0,2181 and $-1,1381$. The last would give a very small radius, and is therefore rejected.

Now, proceeding with this value of $\frac{1}{a}$ and the $\frac{1}{n''}$, we get the other radius b' , and then, by means of u' , we get the other radius which is common to the four surfaces.

Then, by $\frac{1}{\rho'} = \frac{1}{\rho''} - c'$, we get the value of P.

The radii being all on the scale of which n is the unit, they must be divided by P to obtain their value on the scale which has P for its unit. This will give us

$$\begin{aligned}
 a &= -b, = -a', = b', = 0,530 \\
 a'' &= 1,215 \\
 b'' &= -0,3046 \\
 P &= 1.
 \end{aligned}$$

This is not a very good form, because the last surface has too great curvature.

We thought it worth while to compute the curvatures for a case where the internal surfaces of the lenses coincide, in order to obtain the advantages mentioned on a former occasion. The form is as follows:

The middle lens is a double concave of flint-glass; the last lens is of crown-glass, and has equal curvatures on both sides. The following table contains the dimensions of the glasses for a variety of focal distances. The first column contains the focal distances in inches; the second contains the radii of the first surface in inches; the third contains the radii of the posterior surface of the first lens and anterior surface of the second; and the fourth column has the radii of the three remaining surfaces.

P	a	b, a'	b', a'', b''
12	9,25	6,17	12,75
24	18,33	12,25	25,5
36	27,33	18,25	38,17
48	36,42	24,33	50,92
60	45,42	30,33	63,68
72	54,5	36,42	76,33
84	63,5	42,5	89,
96	72,6	48,5	101,75
108	81,7	54,58	114,42
120	90,7	60,58	127,17

We have had an opportunity of trying glasses of this construction, and found them equal to any of the same length, although executed by an artist by no means excellent in his profession as a glass-grinder. This very circumstance gave us the opportunity of seeing the good effects of interposing a transparent substance between the glasses. We put some clear turpentine varnish between them, which completely prevented all reflection from the internal surfaces. Accordingly these telescopes were surprisingly bright; and although the roughness left by the first grinding was very perceptible by the naked eye before the glasses were put together, yet when joined in this manner it entirely disappeared, even when the glasses were viewed with a deep magnifier.

The aperture of an object-glass of this construction of 30 inches focal distance was $2\frac{1}{2}$ inches, which is considerably more than any of Mr Dollond's that we have seen.

If we should think it of advantage to make all the three lenses isosceles, that is, equally curved on both surfaces, the general equation will give the following radii:

$$\begin{aligned}
 a &= +0,639 & a' &= -0,3285 & a'' &= +0,6413 \\
 b &= -0,639 & b' &= +0,5285 & b'' &= -0,6413
 \end{aligned}$$

This seems a good form, having large radii.

Should we choose to have the two crown-glass lenses isosceles and equal, we must make

$$\begin{aligned}
 a &= +0,412 & a' &= -0,5227 & a'' &= +0,6412 \\
 b &= -0,412 & b' &= +0,5367 & b'' &= -0,6412
 \end{aligned}$$

This form hardly differs from the last.

Our readers will recollect that all these forms proceed on certain measures of the refractive and dispersive powers of the substances employed, which are expressed by $n, m', d m,$ and $d m'$: and we may be assured that the formulæ are sufficiently exact, by the comparison (which we have made in one of the cases) of the result of the formula and the trigonometrical calculation of the progress of the rays. The error was but $\frac{1}{100}$ th of the whole, ten times less than another error, which unavoidably remains, and will be considered presently. These measures of refraction and dif-

fusion were carefully taken; but there is great diversity, particularly in the flint-glass. We are well informed that the manufacture of this article has considerably changed of late years, and that it is in general less refractive and less dispersive than formerly. This must evidently make a change in the forms of achromatic glasses. The proportion of the focal distance of the crown-glasses to that of the flint must be increased, and this will occasion a change in the curvatures, which shall correct the spherical aberration. We examined with great care a parcel of flint-glass which an artist of this city got lately for the purpose of making achromatic object-glasses, and also some very white crown-glass made in Leith; and we obtained the following measures:

$$\begin{aligned}
 m &= 1,529 & \frac{d m}{d m'} &= \frac{142}{219} = 0,64841. \\
 m' &= 1,578
 \end{aligned}$$

We computed some forms for triple object-glasses made of these glasses, which we shall subjoin as a specimen of the variations which this change of data will occasion.

If all the three lenses are made isosceles, we have

$$\begin{aligned}
 a &= +0,796 & a' &= -0,474 & a'' &= +0,502 \\
 b &= -0,796 & b' &= +0,474 & b'' &= -0,502
 \end{aligned}$$

Or

$$\begin{aligned}
 a &= 0,504 & a' &= -0,475 & a'' &= +0,793 \\
 b &= -0,504 & b' &= 0,475 & b'' &= -0,793
 \end{aligned}$$

If the middle lens be isosceles, the two crown-glass lenses may be made of the same form and focal distance, and placed the same way. This will give us

$$\begin{aligned}
 a &= +0,705 & a' &= -0,475 & a'' &= +0,705 \\
 b &= -0,705 & b' &= +0,475 & b'' &= -0,547
 \end{aligned}$$

N. B. This construction allows a much better form, if the measures of refraction and dispersion are the same that we used formerly. For we shall have

$$\begin{aligned}
 a &= +0,628 & a' &= -0,579 & a'' &= +0,628 \\
 b &= -0,749 & b' &= +0,579 & b'' &= -0,749
 \end{aligned}$$

And this is pretty near the practice of the London opticians.

We may here observe, upon the whole, that an amateur has little chance of succeeding in these attempts. The diversity of glasses, and the uncertainty of the workman's producing the very curvatures which he intends, is so great, that the object-glass turns out different from our expectation. The artist who makes great numbers acquires a pretty certain guess at the remaining error; and having many lenses intended to be of one form, but unavoidably differing a little from it, he tries several of them with the other two, and finding one better than the rest, he makes use of it to complete the set.

The great difficulty in the construction is to find the exact proportion of the dispersive powers of the crown and flint glass. The crown is pretty constant; but there is hardly two pots of flint-glass which have the same dispersive power. Even if constant, it is difficult to measure it accurately; and an error in this greatly affects the instrument, because the focal distances of the lenses must be nearly as their dispersive powers. The method of examining this circumstance, which we found most accurate, was as follows:

The sun's light, or that of a brilliant lamp, passed through a small hole in a board, and fell on another board pierced also with a small hole. Behind this was placed a fine prism A (fig. 10.), which formed a spectrum ROV on a screen pierced with a small hole. Behind this was placed a prism B of the substance under examination. The ray which was refracted by it fell on the wall at D, and the distance of its illumination from that point to C, on which an unrefracted ray would have fallen, was carefully measured. This showed the refraction of that colour. Then, in order that we might be certain that we always compared the refraction of

scope. the same precise colour by the different prisms placed at B, we marked the precise position of the prism A when the ray of a particular colour fell on the prism B. This was done by an index AG attached to A, and turning with it, when we caused the different colours of the spectrum formed by A to fall on B. Having examined one prism B with respect to all the colours in the spectrum formed by A, we put another B in its place. Then bringing A to all its former positions successively, by means of a graduated arch HGK, we were certain that when the index was at the same division of the arch it was the very ray which had been made to pass through the first prism B in a former experiment. We did not solicitously endeavour to find the very extreme red and violet rays; because, although we did not learn the whole dispersions of the two prisms, we learned their proportions, which is the circumstance wanted in the construction of achromatic glasses. It is in vain to attempt this by measuring the spectrums themselves; for we cannot be certain of selecting the very same colours for the comparison, because they succeed in an insensible gradation.

The intelligent reader will readily observe, that we have hitherto proceeded on the supposition, that when, by means of contrary refractions, we have united the extreme red and violet rays, we have also united all the others. But this is quite gratuitous. Sir Isaac Newton would, however, have made the same supposition; for he imagined that the different colours divided the spectrum formed by all substances in the proportions of a musical canon. This is a mistake. When a spectrum is formed by a prism of crown-glass, and another of precisely the same length is formed by the side of it by a prism of flint-glass, the confine between the green and blue will be found precisely in the middle of the first spectrum, but in the second it will be considerably nearer to the red extremity. In short, different substances do not disperse the colours in the same proportion.

The effect of this irrationality (so to call it) of dispersion, will appear plainly, we hope, in the following manner: Let A (fig. 9. A) represent a spot of white solar light falling perpendicularly on a wall. Suppose a prism of common glass placed behind the hole through which the light is admitted, with its refracting angle facing the left hand. It will refract the beam of light to the right, and will at the same time disperse this heterogeneous light into its component rays, carrying the extreme red ray from A to R, the extreme orange from A to O, the extreme yellow from A to Y, &c. and will form the usual prismatic spectrum ROYGPVC. If the whole length KC be divided into 1000 parts, we shall have (when the whole refraction AK is small) RO very nearly 25, RY=200, RG=333, RB=500, RI=667, RV=778, and RC=1000; this being the proportion observed in the differences of the sines of refraction by Sir Isaac Newton.

Perhaps a refracting medium may be found such, that a prism made of it would retract the white light from A, in the upper line of this figure, in such a manner that a spectrum R'OYGB'PVC' shall be formed at the same distance from A', and of the same length, but divided in a different proportion. We do not know that such a medium has been found; but we know that a prism of flint-glass has its refractive and dispersive powers so constituted, that if A'H' be taken about $\frac{1}{4}$ of AR, a spot of white light, formed by rays falling perpendicularly at H, will be so refracted and dispersed, that the extreme red ray will be carried from H' to R', and the extreme violet from H to C', and the intermediate colours to intermediate points, forming a spectrum resembling the other, but having the colours more condensed towards R', and more dilated towards C'; so that the ray which the common glass carried to the middle

point B of the spectrum RC is now in a point B' of the Telescope. spectrum R'C', considerably nearer to R'.

Dr Blair has found, on the other hand, that certain fluids, particularly such as contain the muriatic acid, when formed into a prism, will refract the light from H' (in the lower line) so as to form a spectrum R'C' equal to RC, and as far removed from A' as RC is from A, but having the colours more dilated toward R', and more condensed toward C, than is observed in RC; so that the ray which was carried by the prism of common glass to the middle point B is carried to a point B', considerably nearer to C'.

Let us now suppose that, instead of a white spot at A, we have a prismatic spectrum AB (fig. 9. B), and that the prism of common glass is applied as before, immediately behind the prism which forms the spectrum AB. We know that this will be refracted sidewise, and will make a spectrum ROYGBFC, inclined to the plane of refraction in an angle of 45° ; so that drawing the perpendicular RC, we have $RC=CC$.

We also know that the prism of flint-glass would refract the spectrum formed by the first prism on EHF, in such a manner that the red ray will go to R, the violet to C, and the intermediate rays to points o, y, g, b, p, v, so situated that O'o is = R'O' of the other figure; Y'y is = R'Y' of that figure, Gg = R'G, &c. These points must therefore lie in a curve Ro'ygb'p'v'C, which is convex toward the axis R'C.

In like manner we may be assured that Dr Blair's fluid will form a spectrum Ro'y'g'b'p',v'C, concave toward R'C.

Let it be observed by the way, that this is a very good method for discovering whether a medium disperses the light in the same proportion with the prism which is employed for forming the first spectrum AB or EF. It disperses in the same or in a different proportion, according as the oblique spectrum is straight or crooked; and the exact proportion corresponding to each colour is had by measuring the ordinates of the curves RbC or Rb'C.

Having formed the oblique spectrum RBC by a prism of common glass, we know that an equal prism of the same glass, placed in a contrary position, will bring back all the rays from the spectrum RBC to the spectrum AB, laying each colour on its former place.

In like manner, having formed the oblique spectrum RbC by a prism of flint-glass, we know that another prism of flint-glass, placed in the opposite direction, will bring all the rays back to the spectrum EHF.

But having formed the oblique spectrum RBC by a prism of common glass, if we place the flint-glass prism in the contrary position, it will bring the colour R back to E, and the colour C to F; but it will not bring the colour B to H, but to a point b, such that Bb is equal to bH, and bB to bH. In like manner, the other colours will not be brought back to the straight line EHF, but to a curve Ebf, forming a crooked spectrum.

In like manner, the fluids discovered by Dr Blair, when employed to bring back the oblique spectrum RBC formed by common glass, will bring its extremities back to E and F, and form the crooked spectrum Ebf lying beyond EHF.

This experiment evidently gives us another method for examining the proportionality of the dispersion of different substances.

Having, by common glass, brought back the oblique spectrum formed by common glass to its natural place AB, suppose the original spectrum at AB to contract gradually (as Newton has made it do by means of a lens), it is plain that the oblique spectrum will also contract, and so will the

Telescope. second spectrum at AB; and it will at last coalesce into a white spot. The effect will be equivalent to a gradual compression of the whole frame, by which the parallel lines AR and BC gradually approach, and at last unite.

In like manner, when the oblique spectrum formed by flint-glass is brought back to EHF by a flint-glass prism, and the figure compressed in the same gradual manner, all the colours will coalesce into a white spot.

But when flint-glass is employed to bring back the oblique spectrum formed by common glass, it forms the crooked spectrum E**b**F. Now let the figure be compressed. The curve E**b**F will be doubled down on the line H**b**, and there will be formed a compound spectrum H**b**, quite unlike the common spectrum, being purple or claret coloured at H by the mixture of the extreme red and violet, and green ed with blue at *b* by the mixture of the green and blue. The fluid prisms would in like manner form a spectrum of the same kind on the other side of H.

This is precisely what is observed in achromatic object-glasses made of crown-glass and flint: for the refraction from A to R corresponds to the refraction of the convex crown-glass; and the contrary refraction from R to E corresponds to the contrary refraction of the concave flint-glass, which still leaves a part of the first refraction, producing a convergence to the axis of the telescope. It is found to give a purple or wine coloured focus, and within this a green one, and between these an imperfect white. Dr Blair found, that when the eye glass was drawn out beyond its proper distance, a star was surrounded by a green fringe, by the green end of the spectrum, which crossed each other within the focus; and when the eye-glass was too near the object-glass, the star had a wine-coloured fringe. The green rays were ultimately most refracted. *N. B.* We should expect the fringe to be of a blue colour rather than a green. But this is easily explained: The extreme violet rays are very faint, to as hardly to be sensible; therefore when a compound glass is made as achromatic as possible to our senses, in all probability (nay certainly) these almost insensible violet rays are left out, and perhaps the extreme colours which are united are the red and the middle violet rays. This makes the green to be the mean ray, and therefore the most outstanding when the dispersions are not proportional.

Dr Blair very properly calls these spectrums, H**b** and H**b**, secondary spectrums, and seems to think that he is the first who has taken notice of them. But Mr Clairault was too accurate a mathematician, and too careful an observer, not to be aware of a circumstance which was of primary consequence to the whole inquiry. He could not but observe that the success relied on this very particular, and that the proportionality of dispersion was indispensably necessary.

This subject was therefore touched on by Clairault; and fully discussed by Boscovich, first in his *Dissertations* published at Vienna in 1759; then in the *Comment. Bononiensis*; and, lastly, in his *Opuscula*, published in 1785. Dr Blair, in his ingenious Dissertation on Achromatic Glasses, read to the Royal Society of Edinburgh in 1793, seems not to have known of the labours of these writers; speaks of it as a new discovery; and exhibits some of the consequences of this principle in a singular point of view, as something very paradoxical and inconsistent with the usually received notions on these subjects. But they are by no means so. We are, however, much indebted to his ingenious researches, and his successful endeavours to find some remedy for this imperfection of achromatic glasses. Some of his contrivances are exceedingly ingenious; but had the Doctor consulted these writers, he would have saved himself a good deal of trouble.

Boscovich shows how to unite the two extremes with the most outstanding colour of the secondary spectrum, by means of a third substance. When we have done this, the aberration occasioned by the secondary spectrums must be prodigiously diminished; for it is evidently equivalent to the union of the points H and *b* of our figure. Whatever cause produces this must diminish the curvature of the arches E**b** and *b*F: but even if these curvatures were not diminished, their greatest ordinates cannot exceed $\frac{1}{3}$ th of H**b**; and we may say, without hesitation, that by uniting the mean or most outstanding ray with the two extremes, the remaining dispersion will be as much less than the uncorrected colour of Dollond's achromatic glass, as this is less than four times the dispersion of a common object-glass. It must therefore be altogether insensible.

Boscovich asserts, that it is not possible to unite more than two colours by the opposite refraction of two substances, which do not disperse the light in the same proportions. Dr Blair makes light of this assertion, as he finds it made in general terms in the vague and paltry extract made by Priestley from Boscovich in his *Essay on the History of Optics*; but had he read this author in his own dissertations, he would have seen that he was perfectly right. Dr Blair, however, has hit on a very ingenious and effectual method of producing this union of three colours. In the same way as we correct the dispersion of a concave lens of crown-glass by the opposite dispersion of a concave lens of flint-glass, we may correct the secondary dispersion of an achromatic convex lens by the opposite secondary dispersion of an achromatic concave lens. But the intelligent reader will observe, that this union does not contradict the assertion of Boscovich, because it is necessarily produced by means of three refracting substances.

The most essential service which the public has received at the hands of Dr Blair is the discovery of fluid mediums of a proper dispersive power. By composing the lenses of such substances, we are at once freed from the irregularities in the refraction and dispersion of flint-glass, which the chemists have not been able to free it from. In whatever way this glass is made, it consists of parts which differ both in refractive and dispersive power; and when taken up from the pot, these parts mix in threads, which may be disseminated through the mass in any degree of fineness. But they still retain their properties; and when a piece of flint-glass has been toined into a lens, the eye, placed in its focus, sees the whole surface occupied by glittering threads or broader veins running across it. Great rewards have been offered for removing this defect, but hitherto to no purpose. We beg leave to propose the following method: Let the glass be reduced to powder, and then melted with a great proportion of alkaline salt, so as to make a liquor silicum. When precipitated from this by an acid, it must be in a state of very uniform composition. If again melted into glass, we should hope that it would be free from this defect; if not, the case seems to be desperate.

But by using a fluid medium, Dr Blair was freed from all this embarrassment; and he acquired another immense advantage, that of adjusting at pleasure both the refractive and dispersive powers of his lenses. In solid lenses, we do not know whether we have taken the curvatures suited to the refractions till our glass is finished; and if we have mistaken the proportions, all our labour is lost. But when fluids are used, it is enough that we know nearly the refractions. We suit our focal distances to these, and then select our curvatures, so as to remove the aberration of figure, preserving the focal distances. Thus, by properly tempering the fluid mediums, we bring the lens to agree precisely

precisely with the theory, perfectly achromatic, and the aberration of figure as much corrected as is possible.

Dr Blair examined the refractive and dispersive powers of a great variety of substances, and found great varieties in their actions on the different colours. This is indeed what every well informed naturalist would expect. There is no doubt now among naturalists about the mechanical connection of the phenomena of nature; and all are agreed that the chemical actions of the particles of matter are perfectly like in kind to the action of gravitating bodies; that all these phenomena are the effects of forces like those which we call attractions and repulsions, and which we observe in magnets and electrified bodies; that light is refracted by forces of the same kind, but differing chiefly in the small extent of their sphere of activity. One who views things in this way will expect, that as the actions of the same acid for the different alkalis are different in degree, and as the different acids have also different actions on the same alkali, in like manner different substances differ in their general refractive powers, and also in the proportion of their action on the different colours. Nothing is more unlikely therefore than the proportional dispersion of the different colours by different substances; and it is surprising that this inquiry has been so long delayed. It is hoped that Dr Blair will oblige the public with an account of the experiments which he has made. This will enable others to cooperate in the improvement of achromatic glasses. We cannot derive much knowledge from what he has already published, because it was chiefly with the intention of giving a popular, though not an accurate, view of the subject. The constructions which are there mentioned are not those which he found most effectual, but those which would be most easily understood, or demonstrated by the slight theory which is contained in the dissertation; besides, the manner of expressing the difference of refrangibility, perhaps chosen for its paradoxical appearance, does not give us a clear notion of the characteristic differences of the substances examined. Those rays which are ultimately most deflected from their direction, are said to have become the most refrangible by the combination of different substances, although, in all the particular refractions by which this effect is produced, they are less refracted than the violet light. We can just gather this much, that common glass disperses the rays in such a manner, that the ray which is in the confine of the green and blue occupies the middle of the prismatic spectrum; but in glasses, and many other substances, which are more dispersive, this ray is nearer to the ruddy extremity of the spectrum. While therefore the straight line RC' (fig. 9. B) terminates the ordinates Oo' , YY' , Gg' , &c. which represent the dispersion of common glass, the ordinates which express the dispersions of these substances are terminated by a curve passing through R and C' , but lying below the line RC' . When therefore parallel heterogeneous light is made to converge to the axis of a convex lens of common glass, as happens at F in fig. 5. C, the light is dispersed, and the violet rays have a shorter focal distance. If we now apply a concave lens of greater dispersive power, the red and violet rays are brought to one focus F' ; but the green rays, not being so much refracted away from F , are left behind at r , and have now a shorter focal distance. But Dr Blair afterwards found that this was not the case with the muriatic acid, and some solutions in it. He found that the ray which common glass caused to occupy the middle of the spectrum was much nearer to

the blue extremity when refracted by these fluids. Therefore a concave lens formed of such fluids which united the red and violet rays in F' , refracted the green rays to r .

Having observed this, it was an obvious conjecture, that a mixture of some of these fluids might produce a medium, whose action on the intermediate rays should have the same proportion that is observed on common glass; or that two of them might be found which formed spectra similarly divided, and yet differing sufficiently in dispersive power to enable us to destroy the dispersion by contrary refractions, without destroying the whole refraction. Dr Blair accordingly found a mixture of solutions of ammoniacal and mercurial salts, and also some other substances, which produced dispersions proportional to that of glass, with respect to the different colours.

And thus has the result of this intricate and laborious investigation corresponded to his utmost wishes. He has produced achromatic telescopes which seem as perfect as the thing will admit of; for he has been able to give them such apertures, that the *inorigible* aberration arising from the spherical surfaces becomes a sensible quantity, and precludes further amplification by the eye-glasses. We have examined one of his telescopes: The focal distance of the object-glass did not exceed 17 inches, and the aperture was fully $\frac{3}{8}$ inches. We viewed some single and double stars and some common objects with this telescope; and found, that in magnifying power, brightness, and distinctness, it was manifestly superior to one of Mr Dollond's of 42 inches focal length. It also gave us an opportunity of admiring the dexterity of the London artists, who could work the glasses with such accuracy. We had most distinct vision of a star when using an erecting eye piece, which made this telescope magnify more than a hundred times; and we found the field of vision as uniformly distinct as with Dollond's 42 inch telescope magnifying 26 times. The intelligent reader must admire the nice figuring and centering of the very deep eye-glasses which are necessary for this amplification.

It is to be hoped that Dr Blair will extend his views to glasses of different compositions, and thus give us object-glasses which are solid; for those composed of fluids have inconveniences which will hinder them from coming into general use, and will confine them to the museums of philosophers. We imagine that antimonial glasses bid fair to answer this purpose, if they could be made free of colour, so as to transmit enough of light. We recommend this dissertation to the careful perusal of our readers. Those who have not made themselves much acquainted with the delicate and abstruse theory of aberrations, will find it exhibited in such a popular form as will enable them to understand its general aim; and the well-informed reader will find many curious indications of inquiries and discoveries yet to be made.

We now proceed to consider the eye-glasses or glasses of telescopes. The proper construction of an eye piece is not less essential than that of the object-glass. But our limits will not allow us to treat this subject in the same detail. We have already extended this article to a great length, because we do not know of any performance in the English language which will enable our readers to understand the construction of achromatic telescopes; an invention which reflects honour on our country, and has completed the discoveries of our illustrious Newton. Our readers will find abundant information in Dr Smith's Optics concerning the eye-glasses, chiefly deduced from Huyghen's fine theory of aberration (A). At the same time, we must again pay Mr Dollond

(A) While we thus repeatedly speak of the theory of spherical aberration as coming from Mr Huyghens, we must not omit

Telescope. Dollond the merited compliment of saying, that he was the first who made any scientific application of this theory to the compound eye-piece for erecting the object. His eye-pieces of five and six glasses are very ingenious reduplications of Huyghens's eye-piece of two glasses, and would probably have superseded all others, had not his discovery of achromatic object-glasses cause! opticians to consider the chromatic dispersion with more attention, and pointed out methods of correcting it in the eye-piece without any compound eye-glasses. They have found that this may be more conveniently done with four eye-glasses, without sensibly diminishing the advantages which Huyghens showed to result from employing many small refractions instead of a lesser number of great ones. As this is a very curious subject, we shall give enough for making our readers fully acquainted with it, and content ourselves with merely mentioning the principles of the other rules for constructing an eye-piece.

Such readers as are less familiarly acquainted with optical discussions will do well to keep in mind the following consequences of the general focal theorem (OPTICS n^o 141. Cor. 5.).

If AB (fig. 10. B) be a lens, R a radiant point or focus of incident rays, and a the focus of parallel rays coming from the opposite side; then,

1. Draw the perpendicular $a a'$ to the axis, meeting the incident ray in a' , and $a' A$ to the centre of the lens. The refracted ray BF is parallel to $a' A$: for $R a' : a' A (= R a : a A) = R B : B F (= R A : A F)$, which is the focal theorem.

2. An oblique pencil B**P** b proceeding from any point P which is not in the axis, is collected to the point f , where the refracted ray BF cuts the line P**A** f drawn from P through the centre of the lens: for $P a : a' A = P B : B f$, which is also the focal theorem.

The Galilean telescope is susceptible of so little improvement, that we need not employ any time in illustrating its performance.

The simple astronomical telescope is represented in fig. 11. The beam of parallel rays, inclined to the axis, is made to converge to a point G, where it forms an image of the lowest point of a very distant object. These rays decussating from G fall on the eye-glass; the ray from the lowest point B of the object-glass falls on the eye-glass at b ; and the ray from A falls on a ; and the ray from the centre O falls on o . These rays are rendered parallel, or nearly so, by refraction through the eye-glass, and take the direction $b i, o I, a i$. If the eye be placed so that this pencil of parallel rays may enter it, they converge to a point of the retina, and give distinct vision of the lowest point of the object. It appears inverted, because the rays by which we see its lowest point come in the direction which in simple vision is connected with the upper point of an object. They come from above, and therefore are thought to proceed from above. We see the point as if situated in the direction $I o$. In like manner the eye placed at I, sees the upper point of the object in the direction IP, and its middle in the direction IE. The proper place for the eye is I: if brought much nearer the glass, or removed much farther

from it, some, or the whole, of this extreme pencil of rays will not enter the pupil. It is therefore of importance to determine this point. Because the eye requires parallel rays for distinct vision, it is plain that F must be the principal focus of the eye-glass. Therefore, by the common focal theorem (OPTICS, n^o 141. Cor. 5.), $OF : OE = OE : OI$, or $OF : FE = OE : EI$.

The magnifying power being measured by the magnitude of the visual angle, compared with the magnitude of the visual angle with the naked eye, we have $\frac{o I p}{o O p}$, or $\frac{o I F}{o O F}$ for the measure of the magnifying power. This is very nearly $= \frac{OE}{EI}$, or $\frac{OF}{FI}$.

As the line OE, joining the centres of the lenses, and perpendicular to their surfaces, is called the axis of the telescope, so the ray OG is called the axis of the oblique pencil, being really the axis of the cone of light which has the object-glass for its base. This ray is through its whole course the axis of the oblique pencil; and when its course is determined, the amplification, the field of vision, the apertures of the glasses, are all determined. For this purpose we have only to consider the centre of the object-glass as a radiant point, and trace the process of a ray from this point through the other glasses: this will be the axis of some oblique pencil.

It is evident, therefore, that the field of vision depends on the breadth of the eye-glass. Should we increase this, the extreme pencil will pass through I, because O and I are still the conjugate foci of the eye-glass. On the other hand, the angle resolved on for the extent or field of vision gives the breadth of the eye-glass.

We may here observe, by the way, that for all optical instruments there must be two optical figures considered. The first shows the progress of a pencil of rays coming from one point of the object. The various focuses of this pencil show the places of the different images, real or virtual. Such a figure is formed by the three rays AG $a i$, OG $o I$, BG $b i$.

The second shows the progress of the axes of the different pencils proceeding through the centre of the object-glass. The locuses of this pencil of axes show the places where an image of the object glass is formed; and this pencil determines the field of vision, the apertures of the lenses, and the amplification or magnifying power. The three rays OG $o I$, OFEI, OHPI, form this figure.

See also fig. 17. where the progress of both sets of pencils is more diversified.

The perfection of a telescope is to represent an object in its proper shape, distinctly magnified, with a great field of vision, and sufficiently bright. But there are limits to all these qualities; and an increase of one of them, for the most part, diminishes the rest. The brightness depends on the aperture of the object glass, and will increase in the same proportion (because $i i$ will always be to AB in the proportion of EF to FO), till the diameter of the emergent pencil is equal to that of the pupil of the eye. Increasing the object-glass any more, can send no more light into the eye. But we cannot make the emergent pencil nearly so large

omit giving a due share of the honour of it to Dr Barrow and Mr James Gregory. The first of these authors, in his Optical Lectures delivered at Cambridge, has given every proposition which is employed by Huyghens, and has even prosecuted the matter much further. In particular, his theory of oblique slender pencils is of imminente consequence to the perfection of telescopes, by showing the methods for making the image of an extended surface as flat as possible. Gregory, too, has given all the fundamental propositions in his *Optica Promota*. But Huyghens, by taking the subject together, and treating it in a system, has greatly simplified it: and his manner of viewing the principal parts of it is incomparably more perspicuous than the performances of Barrow and Gregory.

Telescope. large as this when the telescope magnifies much; for the great aperture of the object-glass produces an indistinct image at GF, and its indistinctness is magnified by the eye-glass.

A great field of vision is incompatible with the true shape of the object; for it is not strictly true that all rays flowing from O are refracted to I. Those rays which go to the margin of the eye-glass cross the axis between E and I; and therefore they cross it at a greater angle than if they passed through I. Now had they really passed through I, the object would have been represented in its due proportions. Therefore since the angles of the marginal parts are enlarged by the aberration of the eye-glass, the marginal parts themselves will appear enlarged, or the object appear distorted. Thus a chess-board viewed through a reading-glass appears drawn out at the corners, and the straight lines are all changed into curves, as is represented in fig. 13.

The circumstance which most peremptorily limits the extent of field is the necessary distinctness. If the vision be indistinct, it is useless, and no other quality can compensate this defect. The distortion is very inconsiderable in much larger angles of vision than we can admit, and is unworthy of the attention paid to it by optical writers. They have been induced to take notice of it, because the means of correcting it in a considerable degree are attainable, and afford an opportunity of exhibiting their knowledge; whereas the indistinctness which accompanies a large field is a subject of most difficult discussion, and has hitherto baffled all their efforts to express by any intelligible or manageable formulæ.

*Quæque tractata nitescere posse
Desperat relinquit.*

This subject must, however, be considered. The image at GF of a very remote object is not a plain surface perpendicular to the axis of the telescope, but is nearly spherical, having O for its centre. If a number of pencils of parallel rays crossing each other in I fall on the eye-glass, they will form a picture on the opposite side, in the focus F. But this picture will by no means be flat, nor nearly so, but very concave towards E. Its exact form is of most difficult investigation. The elements of it are given by Dr Barrow; and we have given the chief of them in the article OPTICS, when considering the foci of infinitely slender pencils of oblique rays. Therefore it is impossible that the picture formed by the object-glass can be seen distinctly in all its parts by the eye-glass. Even if it were flat, the points G and H (fig. 11.) are too far from the eye-glass when the middle F is at the proper distance for distinct vision. When, therefore, the telescope is so adjusted that we have distinct vision of the middle of the field, in order to see the margin distinctly we must push in the eye-glass; and having so done, the middle of the field becomes indistinct. When the field of vision exceeds 12 or 15 degrees, it is not possible by any contrivance to make it tolerably distinct all over; and we must turn the telescope successively to the different parts of the field that we may see them agreeably.

The cause of this indistinctness is, as we have already said, the shortness of the lateral foci of lateral and oblique pencils refracted by the eye-glass. We have shown (in OPTICS, n° 252) how to determine these in all the cases which occur. But the determination is not complete, and relates only to those rays which are in a plane passing through the axis of the lens. But the oblique pencil lGa , by which an eye placed at I sees the point G of the image, is a cone of light, having a circular base on the eye-glass; of which circle ab is one of the diameters. There is a diameter perpendicular to this, which, in this figure, is represented by the point o . Fig. 12. represents the base of the cone as seen by an eye

placed in the axis of the telescope, with the object-glass as appearing behind it. The point b is formed by a ray which comes from the lowest point B of the object-glass, and the point a is illuminated by a ray from A. The point c at the right hand of the circular base of this cone of light came from the point C on the left side of the object-glass; and the light comes to d from D. Now the laws of optics demonstrate, that the rays which come through the points c and d are more convergent after refraction than the rays which come through a and b . The analogies, therefore, which ascertain the foci of rays lying in planes passing thro' the axis do not determine the foci of the others. Of this we may be sensible by looking through a lens to a figure on which are drawn concentric circles crossed by radii. When the telescope is so adjusted that we see distinctly the extremity of one of the radii, we shall not see distinctly the circumference which crosses the extremity with equal distinctness, and *vice versa*. This difference, however, between the foci of the rays which come through a and b , and those which come through c and d , is not considerable in the fields of vision, which are otherwise admissible. But the same difference of foci obtains also with respect to the dispersion of light, and is more remarkable. Both d'Alembert and Euler have attempted to introduce it into their formulæ; but they have made them useless for any practical purpose by their inextricable complication.

This must serve as a general indication of the difficulties which occur in the construction of telescopes, even although the object-glass were perfect, forming an image without the smallest confusion or distortion.

There is yet another difficulty or imperfection. The rays of the pencil aGb , when refracted through the eye-glass, are also separated into their component colours. The edge of the lens must evidently perform the office of a prism, and the white ray Gb will be so dispersed that if bi be the path of its red ray, the violet ray, which makes another part of it, will take such a course bn that the angle ibn will be nearly $\frac{1}{4}$ th of Gbi . The ray Ga passing through a part of the lens whose surfaces are less inclined to each other, will be less refracted, and will be less dispersed in the same proportion very nearly. Therefore the two violet rays will be very nearly parallel when the two red rays are rendered parallel.

Hence it must happen, that the object will appear bordered with coloured fringes. A black line seen near the margin on a white ground, will have a ruddy and orange border on the outside and a blue border within: and this confusion is altogether independent on the object-glass, and is so much the greater as the visual angle bIE is greater.

Such are the difficulties: They would be unsurmountable were it not that some of them are so connected that, to a certain extent, the diminution of one is accompanied by a diminution of the other. Our readers will recollect, that in the article OPTICS we gave some account of what are called the *Causitic curves* (OPTICS n° 252), and showed that these curves are the geometrical loci of the foci of infinitely slender pencils. Consequently the point G is very nearly in the caustic formed by a beam of light consisting of rays parallel to Ia , and occupying the whole surface of the eye-glass, because the pencil of rays which are collected at G is very small. Any thing therefore that diminishes the mutual inclination of the adjoining rays, puts their concurrence farther off. Now this is precisely what we want: for the point G of the image formed by the object-glass is already beyond the focus of the oblique slender pencil of parallel rays a and ib ; and, therefore, if we could make this focus go a little farther from a and b , we shall bring it nearer to G, and obtain more distinct vision of this point of the object. Now

Telescop. let it be recollected, that in moderate refractions through prisms, two rays which are inclined to each other in a small angle are, after refraction, inclined to each other in the same angle. Therefore, if we can diminish the aberration of the ray ai , or oI , or iI' , we diminish their mutual inclination; and consequently the mutual inclination of the rays Ga , Go , Gv , and therefore lengthen the focus, and get more distinct vision of the point G . Therefore we at once correct the distortion and the indistinctness: and this is the aim of Mr Huyghens's great principle of dividing the refractions. See OPTICS, n^o 100.

The general method is as follows: Let o be the object-glass (fig. 14. A) and E the eye-glass of a telescope, and F their common focus, and FG the image formed by the object-glass. The proportion of their focal distances is supposed to be such as gives as great a magnifying power as the perfection of the object-glass will admit. Let BI be the axis of the emergent pencil. It is known by the focal theorem that GE is parallel to BI : therefore BGE is the whole refraction or deflection of the ray OHB from its former direction. Let it be proposed to diminish the aberrations by dividing this into two parts by means of two glasses D and e , so as to make the ultimate angle of vision bie equal to BIE , and thus retain the same magnifying power and visible field. Let it be proposed to divide it into the parts BGC and CGE .

From G draw any line GD to the axis towards O ; and draw the perpendicular DH , cutting OG in H ; draw Hc parallel to GC , cutting GD in g ; draw gf perpendicular to the axis, and ge parallel to GE ; draw eb perpendicular to the axis; draw Dd parallel to GC , and sd perpendicular to the axis.

Then if there be placed at D a lens whose focal distance is Dd , and another at e whose focal distance is ef , the thing is done. The ray OHI will be refracted into Hb , and this into bi parallel to BI .

The demonstration of this construction is so evident by means of the common focal theorem, that we need not repeat it, nor the reasons for its advantages (see OPTICS 100). We have the same magnifying power, and the same field of vision; we have less aberration, and therefore less distortion and indistinctness; and this is brought about by a lens HD of a smaller aperture and a greater focal distance than BE . Consequently, if we are contented with the distinctness of the margin of the field with a single eye-glass, we may greatly increase the field of vision: for if we increase DH to the size of EB we shall have a greater field, and much greater distinctness in the margin; because HD is of a longer focal distance, and will bear a greater aperture, preserving the same distinctness at the edge. On this account the glass HD is commonly called the *Field-glass*.

It must be observed here, however, that although the distortion of the object is lessened, there is a real distortion produced in the image fg . But this, when magnified by the glass e , is smaller than the distortion produced by the glass E , of greater aperture and shorter focus, on the undistorted image GF . But because there is a distortion in the second image fg , this construction cannot be used for the telescopes of astronomical quadrants, and other graduated instruments; because then equal divisions of the micrometer would not correspond to equal angles.

But the same construction will answer in this case, by taking the point D on that side of F which is remote from O (fig. 14. B). This is the form now employed in the telescopes of all graduated instruments.

The exact proportion in which the distortion and the indistinctness at the edges of the field are diminished by this construction, depends on the proportion in which the angle

BGE is divided by GC ; and is of pretty difficult investigation. But it never deviates far (never $\frac{1}{3}$ th in optical instruments) from the proportion of the squares of the angles. We may, without any sensible error, suppose it in this proportion. This gives us a practical rule of easy recollection, and of most extensive use. When we would diminish an aberration by dividing the whole refraction into two parts, we shall do it most effectually by making them equal. In like manner, if we divide it into three parts by means of two additional glasses, we must make each $= \frac{1}{3}$ d of the whole; and so on for a greater number.

This useful problem, even when limited, as we have done, to equal refractions, is as yet indeterminate; that is, susceptible of an infinity of solutions: for the point D , where the field-glass is placed, was taken at pleasure; yet there must be situations more proper than others. The aberrations which produce distortion, and those which produce indistinctness, do not follow the same proportions. To correct the indistinctness, we should not select such positions of the lens HD as will give a small focal distance to be ; that is, we should not remove it very far from F . Huygens recommends the proportion of 3 to 1 for that of the focal distances of the lens HD and eb , and says that the distance De should be $= 2 Fe$. This will make $ei = \frac{1}{2} eF$, and will divide the whole refraction into two equal parts, as any one will readily see by constructing the common optical figure. Mr Short, the celebrated improver of reflecting telescopes, generally employed this proportion; and we shall presently see that it is a very good one.

It has been already observed that the great refractions which take place on the eye-glasses occasion very considerable dispersions, and disturb the vision by fringing every thing with colours. To remedy this, achromatic eye-glasses may be employed, constructed by the rules already delivered. This construction, however, is incomparably more intricate than that of object-glasses: for the equations must involve the distance of the radiant point, and be more complicated; and this complication is immensely increased on account of the great obliquity of the pencils.

Most fortunately the Huyghenian construction of an eye-piece enables us to correct this dispersion to a great degree of exactness. A heterogeneous ray is dispersed at H , and the red ray belonging to it falls on the lens be at a greater distance from the centre than the violet ray coming from H . It will therefore be less refracted (*ceteris paribus*) by the lens be ; and it is possible that the difference may be such that the red and violet rays dispersed at H may be rendered parallel at b , or even a little divergent, so as to unite accurately with the red ray at the bottom of the eye. How this may be affected, by a proper selection of the places and figures of the lenses, will appear by the following proposition, which we imagine is new, and not inelegant.

Let the compound ray OP (fig. 15. A) be dispersed by the lens PC ; and let PV , PR be its violet and red rays, cutting the axis in G and g . It is required to place another lens RD in their way, so that the emergent rays Rv , Vv , shall be parallel.

Produce the incident ray OP to Z . The angles ZPR , ZPV , are given, (and RPV is nearly $= \frac{ZPR}{27}$) and the interfections G and g with the axis. Let F be the focus of parallel red light coming through the lens RD in the opposite direction. Then (by the common optical theorem), the perpendicular Fp will cut PR in such a point p , that pF will be parallel to the emergent ray Rv (see OPTICS, n^o 252 - 256), and to Vv . Therefore if pD cut PV in u , and uf be drawn perpendicular to the axis, we shall have (also by the common theorem) the point f for the focus of violet

Telescope violet rays, and $DF : Df = D_p : Du = 28 : 27$ nearly, or in a given ratio.

The problem is therefore reduced to this, "To draw from a point D in the line CG a line Dp , which shall be cut by the lines PR and PV in the given ratio.

The following construction naturally offers itself: Make $GM : gM$ in the given ratio, and draw MK parallel to Pg . Through any point D of CG draw the straight line PDK , cutting MK in K . Join GK , and draw Dp parallel to KG . This will solve the problem; and, drawing pF perpendicular to the axis, we shall have F for the focus of the lens RD for parallel red rays.

The demonstration is evident: for MK being parallel to Pg , we have $GM : gM = GK : HK = pD : uD = FD : pD$, in the ratio required.

This problem admits of an infinity of solutions; because the point D may be taken anywhere in the line CG . It may therefore be subjected to such conditions as may produce other advantages.

1. It may be restricted by the magnifying power, or by the division which we choose to make of the whole refraction which produces this magnifying power. Thus, if we have resolved to diminish the aberrations by making the two refractions equal, we have determined the angle R_pD . Therefore draw GK , making the angle MGK equal to that which the emergent pencil must make with the axis, in order to produce this magnifying power. Then draw MK parallel to Pg , meeting GK in K . Then draw PK , cutting the axis in D , and Dp parallel to GK , and pF perpendicular to the axis. D is the place, and DF the focal distance of the eye-glass.

2. Particular circumstances may cause us to fix on a particular place D , and we only want the focal distance. In this case the first construction suffices.

3. We may have determined on a certain focal distance DF , and the place must be determined. In this case let

$$\begin{aligned} GF : Fp &= 1 : \tan. G \\ Fp : fu &= 1 : m, m \text{ being } = \frac{27}{28} \\ fu : fg &= \tan. g : t \end{aligned}$$

then $GF : fg = \tan. g : m \tan. G$
then $GF - fg : GF = \tan. g - m \tan. G : \tan. g$
or $Gg + Ff : GF = \tan. g - m \tan. G : \tan. g$;

and $GF = Gg + Ff \frac{\tan. g}{\tan. g - m \tan. G}$, and is therefore given, and the place of F is determined; and since FD is given by supposition, D is determined.

The application of this problem to our purpose is difficult, if we take it in the most general terms; but the nature of the thing makes such limitations that it becomes very easy. In the case of the dispersion of light, the angle GPg is so small that MK may be drawn parallel to FG without any sensible error. If the ray OP were parallel to CG , then G would be the focus of the lens PC , and the point M would fall on C ; because the focal distance of red rays is to that of violet rays in the same proportion for every lens, and therefore $CG : Cg = DF : Df$. Now, in a telescope which magnifies considerably, the angle at the object-glass is very small, and CG hardly exceeds the focal distance; and CG is to Cg very nearly in the same proportion of 28 to 27. We may therefore draw through C (fig. 15. B) a line CK parallel to PG ; then draw GK perpendicular to the axis of the lenses, and join PK ; draw $K'B$ parallel to CG , cutting PK in B ; draw BH parallel to GK , cutting GK in H : Join HD and PK . It is evident that CG is bisected in F' , and that $K'B = 2F'D$: also $K'H : HG = K'B : BE = CD : DG$. Therefore DH is parallel to CK , or to PG . But because $PF = F'K'$, PD is $= DB$, and $IH = HB$. Therefore $pD = HB$, and $FD = K'B$,

$= 2F'D$; and FD is bisected in F' . Therefore $CD = \frac{CG + FD}{2}$ Telescope.

That is, in order that the eye-glass RD may correct the dispersion of the field-glass PC , the distance between them must be equal to the half sum of their focal distances very nearly. More exactly, the distance between them must be equal to the half sum of the focal distance of the eye-glass, and the distance at which the field-glass would form an image of the object-glass. For the point G is the focus to which a ray coming from the centre of the object-glass is refracted by the field-glass.

This is a very simple solution of this important problem. Huyghens's eye-piece corresponds with it exactly. If indeed the dispersion at P is not entirely produced by the refraction, but perhaps combined with some previous dispersion, the point M (fig. 15. A) will not coincide with C , (fig. 15. B), and we shall have GC to GM , as the natural dispersion at P to the dispersion which really obtains there.

This may destroy the equation $CD = \frac{CG + FD}{2}$.

Thus, in a manner rather unexpected, have we freed the eye-glasses from the greatest part of the effect of dispersion. We may do it entirely by pushing the eye-glass a little nearer to the field-glass. This will render the violet rays a little divergent from the red, so as to produce a perfect picture at the bottom of the eye. But by doing so we have hurt the distinctness of the whole picture, because F is not in the focus of RD . We remedy this by drawing both glasses out a little, and the telescope is made perfect.

This improvement cannot be applied to the construction of quadrant telescopes, such as fig. 14. B. Mr Ramsden has attempted it, however, in a very ingenious way, which merits a place here, and is also instructive in another way. The field-glass HD (fig. 14. B) is a plane-convex, with its plane side next the image GF . It is placed very near this image. The consequence of this disposition is, that the image GF produces a vertical image gf , which is much less convex towards the glass. He then places a lens on the point C , where the red ray would cross the axis. The violet ray will pass on the other side of it. If the focal distance of this glass be fc , the vision will be distinct and free from colour. It has, however, the inconvenience of obliging the eye to be close to the glass, which is very troublesome.

This would be a good construction for a magic-lantern, or for the object-glass of a solar microscope, or indeed of any compound microscope.

We may presume that the reader is now pretty familiar with the different circumstances which must be considered in the construction of an eye-piece, and proceed to consider those which must be employed to erect the object.

This may be done by placing the lens which receives the light from the object-glass in such a manner, that a second image (inverted with respect to the first) may be formed beyond it, and this may be viewed by an eye glass. Such a construction is represented in fig. 16. But, besides many other defects, it tinges the object prodigiously with colour. The ray od is dispersed at d into the red ray dr , and the violet $d\tau$, v being farther from the centre than r , the refracted ray $v'v$ crosses rr' both by reason of spherical aberration and its greater refrangibility.

But the common day telescope, invented by F. Rheita, has, in this respect, greatly the advantage of the one now described. See OPTICS, n° 266. The rays of compound light are dispersed at e and f . (Plate CCCXLIV. fig. 13). The violet ray proceeding from f , falls without the red ray at g , but is accurately collected with it at the focus E , as we shall demonstrate by and by. Since they cross each

Telescope. other in E, the violet ray may fall within the red ray at i , and be less refracted than if it had fallen on the same point with the red ray. Had it fallen there it would have separated from it; but by a proper diminution of its refraction, it is kept parallel to it, or nearly so. And this is one excellence of this telescope: when constructed with three eye-glasses perfectly equal, the colour is sensibly diminished, and by using an eye-glass somewhat smaller, it may be removed entirely. — We say no more of it at present, because we shall find its construction included in another, which is still more perfect.

It is evident at first sight that this telescope may be improved, by substituting for the eye-glass ik (fig. 13.) the Huyghenian double eye-glass, or field-glass and eye-glass represented in fig. 14. A, and fig. 14. B; and that the first of these may be improved and rendered achromatic. This will require the two glasses ef and gb to be increased from their present dimensions to the size of a field-glass, suited to the magnifying power of the telescope, supposing it an astronomical telescope. Thus we shall have a telescope of four eye-glasses. The three first will be of a considerable focal distance, and two of them will have a common focus at b . But this is considerably different from the eye-piece of four glasses which are now used, and are far better. We are indebted for them to Mr Dollond, who was a mathematician as well as an artist, and in the course of his research discovered resources which had not been thought of. He had not then discovered the achromatic object-glass, and was busy in improving the eye-glasses by diminishing their spherical aberration. His first thought was to make the Huyghenian addition at both the images of the day telescope. This suggested to him the following eye-piece of five glasses.

Fig. 17. represents this eye-piece, but there is not room for the object-glass at its proper distance. A pencil of rays coming from the upper point of the object is made to converge (by the object-glass) to G , where it would form a picture of that part of the object. But it is intercepted by the lens Aa , and its axis is bent towards the axis of the telescope in the direction ab . At the same time, the rays which converged to G converge to g , and there is formed an inverted picture of the object at gf . The axis of the pencil is again refracted at b , crosses the axis of the telescope in H , is refracted again at c , at d , and at e , and at last crosses the axis in I . The rays of this pencil, diverging from g , are made less diverging, and proceed as if they came from g' , in the line Bgg' . The lens cC causes them to converge to g' , in the line $G'Gg'$. The lens dD makes them converge still more to G' , and there they form an erect picture $G'F'$; diverging from G' , they are rendered parallel by the refraction at e .

At H the rays are nearly parallel. Had the glass Bb been a little farther from A , they would have been accurately so, and the object-glass, with the glasses A and B , would have formed an astronomical telescope with the Huyghenian eye-piece. The glasses C , D , and E , are intended merely for bending the rays back again till they again cross the axis in I . The glass C tends chiefly to diminish the great angle HHb ; and then the two glasses D and E are another Huyghenian eye-piece.

The art in this construction lies in the proper adjustment of the glasses, so as to divide the whole bending of the pencil pretty equally among them, and to form the last image in the focus of the eye-glass, and at a proper distance from the other glass. Bringing B nearer to A would bend the pencil more to the axis. Placing C farther from B would do the same thing; but this would be accompanied with more aberration, because the rays would fall at a greater di-

Telescope. stance from the centres of the lenses. The greatest bending is made at the field-glass D ; and we imagine that the telescope would be improved, and made more distinct at the edges of the field, by employing another glass of great focal distance between C and D .

There is an image formed at H of the object-glasses, and the whole light passes through a small circle in this place. It is usual to put a plate here pierced with a hole which has the diameter of this image. A second image of the object-glass is formed at I , and indeed wherever the pencils cross the axis. A lens placed at H makes no change in any of the angles, nor in the magnifying power, and affects only the place where the images are formed. And, on the other hand, a lens placed at f , or F' , where a real image is formed, makes no change in the places of the images, but affects the mutual inclination of the pencils. This affords a resource to the artist, by which he may combine properties which seem incompatible.

The aperture of A determines the visible field and all the other apertures.

We must avoid forming a real image, such as fg , or $F'G'$, on or very near any glass. For we cannot see this image without seeing along with it every particle of dust and every scratch on the glass. We see them as making part of the object when the image is exactly on the glass, and we see them confusedly, and so as to confuse the object, when the image is near it. For when the image is on or very near any glass, the pencil of light occupies a very small part of its surface, and a particle of dust intercepts a great proportion of it.

It is plain that this construction will not do for the telescope of graduated instruments, because the micrometer cannot be applied to the second image fg , on account of its being a little distorted, as has been observed of the Huyghenian eye-piece.

Also the interposition of the glass C makes it difficult to correct the dispersion.

By proper reasoning from the correction in the Huyghenian eye-piece, we are led to the best construction of one with three glasses; which we shall now consider, taking it in a particular form, which shall make the discussion easy, and make us fully masters of the principles which lead to a better form. Therefore let PA (fig. 18.) be the glass which first receives the light proceeding from the image formed by the object-glass, and let OP be the axis of the extreme pencil. This is refracted into PR , which is again refracted into Rr by the next lens Br . Let b be the focus of parallel rays of the second lens. Draw PBr . We know that $Ab : bB = PB : Br$, and that rays of one kind diverging from P will be collected at r . But if PR , PV be a red and a violet ray, the violet ray will be more refracted at V , and will cross the red ray in some intermediate point g of the line Rr . If therefore the first image had been formed precisely on the lens PA , we should have a second image at fg free from all coloured fringes.

If the refractions at P and R are equal (as in the common day telescope), the dispersion at V must be equal to that at P , or the angle $vVr = VPR$. But we have ultimately $RPV : RrV = BC : AB$, ($= Bb : Ab$ by the focal theorem). Therefore $gVr : grV$ (or $gr : gV$, or $Cf : fB$) $= Bb : Ab$, and $AB : Ab = Rr : Rg$.

This shows by the way the advantage of the common day telescope. In this $AB = 2Ab$, and therefore f is the place of the last image which is free from coloured fringes. But this image will not be seen free from coloured fringes through the eye-glass Cr , if f be its focus: For had gr , gv been both red rays, they would have been parallel after refraction; but gv being a violet ray, will be more refracted. It

will

telescope.

Telescope.

will not indeed be so much deflected from parallelism as the violet ray, which naturally accompanies the red ray to r , because it falls nearer the centre. By computation its dispersion is diminished about $\frac{1}{4}$ th.

In order that gv may be made parallel to gr after refraction, the refraction at r must be such that the dispersion corresponding to it may be of a proper magnitude. How to determine this is the question. Let the dispersion at g be to the dispersion produced by the refraction at r (which is required for producing the intended magnifying power) as 1 to 9 . Make $g : 1 = ff' : f'C, = f'C : CD$, and draw the perpendicular $D'r'$ meeting the refracted ray rr' in r' . Then we know by the common focal theorem, that if f be the focus of the lens C , red rays diverging from g will be united in r' . But the violet ray gv will be refracted into $v'v'$ parallel to rr' . For the angle $vr'r : vgr =$ (ultimately) $fC : CD, = 9 : 1$. Therefore the angle $vr'r$ is equal to the dispersion produced at r , and therefore equal to $r'v'v'$, and $v'v'$ is parallel to rr' .

But by this we have destroyed the distinct vision of the image formed at fg , because it is no longer at the focus of the eye-glass. But distinct vision will be restored by pushing the glasses nearer to the object-glass. This makes the rays of each particular pencil more divergent after refraction through A , but scarcely makes any change in the directions of the pencils themselves. Thus the image comes to the focus f , and makes no sensible change in the dispersions.

In the common day telescope, the first image is formed in the anterior focus of the first eye-glass, and the second image is at the anterior focus of the last eye-glass. If we change this last for one of half the focal distance, and push in the eye-piece till the image formed by the object-glass is half way between the first eye-glass and its focus, the last image will be formed at the focus of the new eye-glass, and the eye-piece will be achromatic. This is easily seen by making the usual computations by the focal theorem. But the visible field is diminished, because we cannot give the same aperture as before to the new eye-glass; but we can substitute for it two eye-glasses like the former, placed close together. This will have the same focal distance with the new one, and will allow the same aperture that we had before.

On these principles may be demonstrated the correction of colour in eye-pieces with three glasses of the following construction.

Let the glasses A and B be placed so that the posterior focus of the first nearly coincides with the anterior focus of the second, or rather so that the anterior focus of B may be at the place where the image of the object-glass is formed, by which situation the aperture necessary for transmitting the whole light will be the smallest possible. Place the third C at a distance from the second, which exceeds the sum of their focal distances by a space which is a third proportional to the distance of the first and second, and the focal distance of the second. The distance of the first eye-glass from the object-glass must be equal to the product of the focal distance of the first and second divided by their sum.

Let Oa, Aa, Bb, Cc , the focal distances of the glasses, be O, a, b, c . Then make $AB = a + b$ nearly; $BC = b + c + \frac{b^2}{b+c}$; $OA = \frac{bc}{b+c}$. The amplification or magnifying power will be $= \frac{ob}{ac}$; the equivalent eye-glass $= \frac{ac}{b}$; and the field of vision $= 3438' \times \frac{\text{Aperture of A}}{\text{foc. dist. ob. gl.}}$

These eye-pieces will admit the use of a micrometer at the place of the first image, because it has no distortion.

Mr Dollond was anxious to combine this achromatism of the eye-pieces with the advantages which he had found in the eye-pieces with five glasses. This eye-piece of three glasses necessarily has a very great refraction at the glass B , where the pencil which has come from the other side of the axis must be rendered again convergent, or at least parallel to it. This occasions considerable aberrations. This may be avoided by giving part of this refraction to a glass put between the first and second, in the same way as he has done by the glass B put between A and C in his five glass eye-piece. But this deranges the whole process. His ingenuity, however, surmounted this difficulty, and he made eye-pieces of four glasses, which seem as perfect as can be desired. He has not published his ingenious investigation; and we observe the London artists work very much at random, probably copying the proportions of some of his best glasses, without understanding the principle, and therefore frequently mistaking. We see many eye-pieces which are far from being achromatic. We imagine therefore that it will be an acceptable thing to the artists to have precise instructions how to proceed, nothing of this kind having appeared in our language, and the investigations of Euler; D'Alembert, and even Boscovich, being so abstruse as to be inaccessible to all but experienced analysts. We hope to render it extremely simple.

It is evident, that if we make the rays of different colours unite on the surface of the last eye-glass but one, commonly called the *field-glass*, the thing will be done, because the dispersion from this point of union will then unite with the dispersion produced by this glass alone; and this increased dispersion may be corrected by the last eye-glass in the way already shown.

Therefore let A, B (fig. 19.) be the stations which we have fixed on for the first and second eye-glasses, in order to give a proper portion of the whole refraction to the second glass. Let b be the anterior focus of B . Draw PB through the centre of B . Make $Ab : bB = AB : BK$. Draw the perpendicular Kr , meeting the refracted ray in r . We know by the focal theorem, that red rays diverging from P will converge to r ; but the violet ray PV , being more refracted, will cross Rr in some point g . Drawing the perpendicular fg , we get f for the proper place of the field-glass. Let the refracted ray Rr , produced backwards, meet the ray OP coming from the centre of the object-glass in O . Let the angle of dispersion RPV be called ρ , and the angle of dispersion at V , that is, rVv , be v , and the angle VrR be r .

It is evident that $OR : OP = \rho : v$, because the dispersions are proportional to the sines of the refractions, which, in this case, are very nearly as the refractions themselves:

Let $\frac{OP}{OR}$ (or $\frac{op}{\rho B}$ or $\frac{\rho B}{bB}$) be made $= m$. Then $v = mp$; also $\rho : r = BK : AB, = bB : Ab$, and $r = p \cdot \frac{Ab}{bB}$, or, making $\frac{Ab}{bB} = n, r = np$; therefore $v : r = m : n, = \frac{\rho B}{bB} : \frac{Ab}{bB}, = \rho B : Ab$.

The angle $RgV = gVr + grV = p \cdot \frac{m+n}{m+n}$; and $RgV : Rrv = Rr : Rg$, or $m+n : n = Rr : Rg$, and $Rg = Rr \frac{n}{m+n}$. But Rr is ultimately $= BK = AB$

Telescope. $bB = \frac{AB}{n}$. Therefore $Rg = \frac{AB}{n} \times \frac{n}{m+n} = \frac{AB}{m+n}$,

$$\text{and } Bf = \frac{AB}{m+n}.$$

This value of Bf is evidently $= bB \times \frac{AB}{\rho B + Ab}$.

Now bB being a constant quantity while the glass B is the same, the place of union varies with $\frac{AB}{\rho B + Ab}$. If we remove B a little farther from A , we increase AB , and ρB , and Ab , each by the same quantity. This evidently diminishes Bf . On the other hand, bringing B nearer to A increases Bf . If we keep the distance between the glasses the same, but increase the focal distance bB , we augment Bf , because this change augments the numerator and diminishes the denominator of the fraction $\frac{bB \times AB}{\rho B + Ab}$.

In this manner we can unite the colours at what distance we please, and consequently can unite them in the place of the intended field-glass, from which they will diverge with an increased dispersion, viz. with the dispersion competent to the refraction produced there, and the dispersion $\rho \times \frac{m+n}{m+n}$ conjoined.

It only remains to determine the proper focal distances of the field-glass and eye-glass, and the place of the eye-glass, so that this dispersion may be finally corrected.

This is an indeterminate problem, admitting of an infinity of solutions. We shall limit it by an equal division of the two remaining refractions, which are necessary in order to produce the intended magnifying power. This construction has the advantage of diminishing the aberration. Thus we know the two refractions, and the dispersion competent to each; it being nearly $\frac{1}{4}$ th of the refraction. Call this q . The whole dispersion at the field-glass consists of q , and of the angle KgV of fig. 19. which we also know to be $= \rho \times \frac{m+n}{m+n}$. Call their sum s .

Let fig. 20. n° 1. represent this addition to the eye-piece. Cg is the field-glass coming in the place of fg of fig. 19. and Rgw is the red ray coming from the glass BR . Draw gs parallel to the intended emergent pencil from the eye-glass; that is, making the angle Csg with the axis correspond to the intended magnifying power. Bisect this angle by the line gk . Make $sg : gq = s : q$, and draw qk , cutting Cg in t . Draw td and Dr perpendicular to the axis in D . Draw sd and Dr perpendicular to the axis. Then a lens placed in D , having the focal distance Dd , will destroy the dispersion at the lens gc , which refracts the ray gw into gr .

Let gv be the violet ray, making the angle $vgr = s$. It is plain, by the common optical theorem, that gr will be refracted into rr' parallel to sD . Draw gD' meeting rr' , and join vr' . By the focal theorem two red rays gr , gv , will be united in r' . But the violet ray gv will be more refracted, and will take the path vv' , making the angle of dispersion $r'v'v = q$, very nearly, because the dispersion at v does not sensibly differ from that at r . Now, in the small angles of refraction which obtain in optical instruments, the angles $rr'v$, rgv are very nearly as gr and rr' , or as gD and Dr' , or as CD and $D'I$; which, by the focal theorem, are as Cd and dD ; that is, $Dd : dc = rgv : rr'v$. But $Dd : dC = Dd : dt = sg : gq = s : q$. But $rgv = s$; therefore $rr'v = q = r'v'v$, and vv' is parallel to rr' , and the whole dispersion at g is corrected by the lens Dr . The focal distance Cc of Cg is had by drawing Cc parallel to Kg , meeting Rg in v , and drawing cc perpendicular to the axis.

It is easy to see that this (not inelegant) construction is

not limited to the equality of the refractions wgr , Krr' . Telescope. In whatever proportion the whole refraction $wgrs$ is divided, we always can tell the proportion of the dispersions which the two refractions occasion at g and r , and can therefore find the values of s and q . Indeed this solution includes the problem in p. 365. col. 1. par. 2.; but it had not occurred to us till the present occasion. Our readers will not be displeas'd with this variety of resource.

The intelligent reader will see, that in this solution some quantities and ratios are assumed as equal which are not strictly so, in the same manner as in all the elementary optical theorems. The parallelism, however, of vv' and rr' may be made accurate, by pushing the lens Dr nearer to Cg , or retiring it from it. We may also, by pushing it still nearer, induce a small divergency of the violet ray, so as to produce accurate vision in the eye, and may thus make the vision through a telescope more perfect than with the naked eye, where dispersion is by no means avoided. It would therefore be an improvement to have the eye-glass in a sliding tube for adjustment. Bring the telescope to distinct vision; and if any colour be visible about the edges of the field, shift the eye-glass till this colour is removed. The vision may now become indistinct: but this is corrected by shifting the place of the whole eye-piece.

We have examined trigonometrically the progress of a red and a violet ray through many eye-pieces of Dollond's and Ramsden's best telescopes; and we have found in all of them that the colours are united on or very near the field-glass; so that we presume that a theory somewhat analogous to ours has directed the ingenious inventors. We meet with many made by other artists, and even some of theirs, where a considerable degree of colour remains, sometimes in the natural order and often in the contrary order. This must happen in the hands of mere imitators, ignorant of principle. We presume that we have now made this principle sufficiently plain.

Fig. 20. N° 2. represents the eye-piece of a very fine spy-glass by Mr Ramsden; the focal length of its object-glass is $8\frac{1}{2}$ inches, with $\frac{1}{10}$ th of aperture, $2^\circ 25'$ of visible field, and 15.4 magnifying power. The distances and focal lengths are of their proper dimensions, but the apertures are $\frac{1}{2}$ larger, that the progress of a lateral pencil might be more distinctly drawn. The dimensions are as follow:
Foc. lengths $Aa=0,775$ $Bb=1,025$ $Cc=1,01$ $Dd=0,79$
Distances $AB=1,18$ $BC=1,83$ $CD=1,105$.

It is perfectly achromatic, and the colours are united, not precisely, at the lens Cg , but about $\frac{1}{10}$ th of an inch nearer the eye-glass.

It is obvious that this combination of glasses may be used as a microscope; for if, instead of the image formed by the object-glass at FG , we substitute a small object, illuminated from behind, as in compound microscopes; and if we draw the eye-piece a very small way from this object, the pencils of parallel rays emergent from the eye-glass D will become convergent to very distant points, and will there form an inverted and enlarged picture of the object, which may be viewed by a Huyghenian eye-piece; and we may thus get high magnifying powers without using very deep glasses. We tried the eye-piece of which we have given the dimensions in this way, and found that it might be made to magnify 180 times with very great distinctness. When used as the magnifier of a solar microscope, it infinitely surpasses every thing we have ever seen. The picture formed by a solar microscope is generally so indistinct, that it is fit only for amusing ladies; but with this magnifier it seemed perfectly sharp. We therefore recommend this to the artists as a valuable article of their trade.

The only thing which remains to be considered in the theory

theory of refracting telescopes is the forms of the different lenses. Hitherto we have had no occasion to consider any thing but their focal distances; but their aberrations depend greatly on the adjustment of their forms to their situations. When the conjugate focuses of a lens are determined by the service which it is to perform, there is a certain form or proportion between the curvatures of their anterior and posterior surfaces, which will make their aberrations the smallest possible.

It is evident that this proportion is to be obtained by making the fluxion of the quantity within the parenthesis in the formula of par. 2. col. 2. p. 345. equal to nothing. When this is done, we obtain this formula for a , the radius of curvature

for the anterior surface of a lens.
$$\frac{1}{a} = \frac{2m^2 + m}{2m + 4} + \frac{4m + 4}{2(m + 4)r^2}$$

where m is the ratio of the sine of incidence to the sine of refraction, and r is the distance of the focus of incident rays, positive or negative, according as they converge or diverge, all measured on a scale of which the unit is n , = half of the radius of the equivalent isosceles lens.

It will be sufficiently exact for our purpose to suppose $m = \frac{3}{2}$, though it is more nearly $\frac{31}{20}$. In this case $\frac{1}{a} = \frac{b}{7} + \frac{10}{7r}$, = $\frac{42r + 70}{49r}$. Therefore $a = \frac{49r}{42r + 70}$. And $\frac{1}{b} = \frac{1}{a} - \frac{10}{7r}$, = $\frac{1 - a}{a}$.

As an example, let it be required to give the radii of curvature in inches for the eye-glass *bc* of page 362. col. 1. par. 2. which we shall suppose of $1\frac{1}{2}$ inches focal distance, and that ec (= r) is $3\frac{1}{3}$ inches.

The radius of curvature for the equivalent isosceles lens is 1,5, and its half is 0,75. Therefore $r = \frac{3\frac{1}{3}}{0,75} = 5$;

and our formula is $a = \frac{49 \times 5}{42 \times 5 + 70} = \frac{245}{280} = 0,875$; and

$\frac{1}{b} = \frac{1 - a}{a} = \frac{0,125}{0,875}$, and $b = \frac{0,875}{0,125} = 7$.

These values are parts of a scale, of which the unit is 0,75 inches. Therefore

a , in inches, = $0,875 \times 0,75$, = $0,65625$

b , in inches, = $7 \times 0,75$, = $5,25$.

And here we must observe that the posterior surface is concave: for b is a positive quantity, because $1 - a$ is a positive quantity as well as a ; therefore the centre of sphericity of both surfaces lies beyond the lens.

And this determination is not very different from the usual practice, which commonly makes this lens a plane convex with its flat side next the eye: and there will not be much difference in the performance of these two lenses; for in all cases of maxima and minima, even a pretty considerable change of the best dimensions does not make a sensible change in the result.

The same consideration leads to a rule which is very simple, and sufficiently exact for ordinary situations. This is to make the curvatures such, that the incident and emergent pencils may be nearly equally inclined to the surfaces of the lens. Thus in the eye-piece with five glasses, A and B should be most convex on their anterior sides; C should be most convex on the posterior side; D should be nearly isosceles; and E nearly plano-convex.

But this is not so easy a matter as appears at first sight. The lenses of an eye-piece have not only to bend the several pencils of light to and from the axis of the telescope; they have also to form images on the axes of these pencils. These offices frequently require opposite forms, as mentioned in par.

3. col. 2 p. 360. Thus the glass A of fig. 20. n^o 2. should be most convex on the side next the object, that it may produce little distortion of the pencils. But it should be most convex next the eye, that it may produce distinct vision of the image FG, which is very near it. This image should have its concavity turned towards A, whereas it is towards the object-glass. We must therefore endeavour to make the vertical image fg flatter, or even convex. This requires a glass very flat before and convex behind. For similar reasons the object-glass of a microscope and the simple eye-glass of an astronomical telescope should be formed the same way.

This is a subject of most difficult discussion, and requires a theory which few of our readers would relish; nor does our limits afford room for it. The artists are obliged to grope their way. The proper method of experiment would be, to make eye-pieces of large dimensions, with extravagant apertures to increase the aberrations, and to provide for each station A, B, C, and D, a number of lenses of the same focal distance, but of different forms: and we would advise making the trial in the way of a solar microscope, and to have two eye-pieces on trial at once. Their pictures can be formed on the same screen, and accurately compared; whereas it is difficult to keep in remembrance the performance of one eye-piece, and compare it with another.

We have now treated the theory of refracting telescopes with considerable minuteness, and have perhaps exceeded the limits which some readers may think reasonable. But we have long regretted that there is not any theory on this subject from which a curious person can learn the improvements which have been made since the time of Dr Smith, or an artist learn how to proceed with intelligence in his profession. If we have accomplished either of these ends, we trust that the public will receive our labours with satisfaction.

We cannot add any thing to what Dr Smith has delivered on the theory of reflecting telescopes. There appears to be the same possibility of correcting the aberration of the great speculum by the contrary aberration of a convex small speculum, that we have practised in the compound object-glass of an achromatic refracting telescope. But this cannot be, unless we make the radius of the convex speculum exceedingly large, which destroys the magnifying power and the brightness. This therefore must be given up. Indeed their performance, when well executed, does already surpass all imagination. Dr Herschel has found great advantages in what he calls the *front view*, not using a plane mirror to throw the pencils to one side. But this cannot be practised in any but telescopes so large, that the loss of light, occasioned by the interposition of the observer's head, may be disregarded.

Nothing remains but to describe the mechanism of some of the most convenient forms.

To describe all the varieties of shape and accommodation which may be given to a telescope, would be a task as trifling as prolix. The artists of London and of Paris have racked their inventions to please every fancy, and to suit every purpose. We shall content ourselves with a few general maxims, deduced from the scientific consideration of a telescope, as an instrument by which the visual angle subtended by a distinct object is greatly magnified.

The chief consideration is to have a steady view of the distant object. This is unattainable, unless the axis of the instrument be kept constantly directed to the same point of it: for when the telescope is gently shifted from its position, the object *seems to move* in the same or in the opposite direction, according as the telescope inverts the object or shows

Telescope shows it erect. This is owing to the magnifying power, because the apparent angular motion is greater than what we naturally connect with the motion of the telescope. This does not happen when we look through a tube without glasses.

All shaking of the instrument therefore makes the object dance before the eye; and this is disagreeable, and hinders us from seeing it distinctly. But a tremulous motion, however small, is infinitely more prejudicial to the performance of a telescope, by making the object quiver before us. A person walking in the room prevents us from seeing distinctly; nay, the very pulsation in the body of the observer, agitates the floor enough to produce this effect, when the telescope has a great magnifying power; For the visible motion of the object is then an imperceptible tremor, like that of an harpsichord wire, which produces an effect precisely similar to optical indistinctness; and every point of the object is diffused over the whole space of the angular tremor, and appears coexistent in every part of this space, just as a harpsichord wire does while it is sounding. The more rapid this motion is, the indistinctness is the more complete. Therefore the more firm and elastic and well bound together the frame-work and apertures of our telescope is, the more hurtful will this consequence be. A mounting of lead, were it practicable, would be preferable to wood, iron, or brass. This is one great cause of the indistinctness of the very finest reflecting telescopes of the usual constructions, and can never be totally removed. In the Gregorian form, it is hardly possible to damp the elastic tremor of the small speculum, carried by an arm supported at one end only, even though the tube were motionless. We were witnesses of a great improvement made on a four-foot reflecting telescope, by supporting the small speculum by a strong plate of lead placed across the tube, and led by an adjusting screw at each end. But even the great mirror may vibrate enough to produce indistinctness. Refracting telescopes are free from this inconvenience, because a small angular motion of the object-glass round one of its own diameters has no sensible effect on the image in its focus. They are affected only by an angular motion of the axis of the telescope or of the eye-glasses.

This single consideration gives us great help towards judging of the merits of any particular apparatus. We should study it in this particular, and see whether its form makes the tube readily susceptible of such tremulous motions. If it does, the firmer it is and the more elastic it is, the worse. All forms therefore where the tube is supported only near the middle, or where the whole immediately or remotely depend on one narrow joint, are defective.

Reasoning in this way, we say with confidence, that of all the forms of a telescope apparatus, the old fashioned simple stand represented in fig. 21. is by far the best, and that others are superior according as the disposition of the points of support of the tube approaches to this. Let the pivots A, B, be fixed in the lintel and sole of a window. Let the four braces terminate very near to these pivots. Let the telescope lie on the pin Ff, resting on the shoulder round the eye-piece, while the far end of it rests on one of the pins 1, 2, 3, &c.; and let the distance of these pins from F very little exceed the length of the telescope. The trembling of the axis, even when considerable, cannot affect the position of the tube, because the braces terminate almost at the pivots. The tremor of the brace CD does as little harm, because it is nearly perpendicular to the tube. And if the object glass were close at the upper supporting pin, and the focus at the lower pin F, even the bending and trembling of the tube will have no effect on its optical axis. The instrument is only subject to horizontal tremors. These

may be almost annihilated by having a slender rod coming from a hook's joint in the side of the window, and passing through such another joint close by the pin F. We have seen an instrument of this form, having AB parallel to the earth's axis. The whole apparatus did not cost 50 shillings, and we find it not in the least sensible manner affected by a storm of wind. It was by observations with this instrument that the tables of the motions of the Georgium Sidus, published in the Edinburgh Transactions, were constructed, and they are as accurate as any that have yet appeared. This is an excellent equatorial.

But this apparatus is not portable, and it is sadly deficient in elegance. The following is the best method we have seen of combining these circumstances with the indispensable requisites of a good telescope.

The pillar VX (fig. 22.) rises from a firm stand, and has a horizontal motion round a cone which completely fills it. This motion is regulated by a rack-work in the box at V. The screw of this rack-work is turned by means of the handle P, of a convenient length, and the screw may be disengaged by the click or detent V, when we would turn the instrument a great way at once. The telescope has a vertical motion round the joint Q placed near the middle of the tube. The lower end of the tube is supported by the stay OT. This consists of a tube RT, fastened to the pillar by a joint T, which allows the stay to move in a vertical plane. Within this tube slides another, with a stiff motion. This tube is connected with the telescope by another joint O, also admitting motion in a vertical plane. The side M of this inner tube is formed into a rack, in which works a pinion fixed to the top of the tube RT, and turned by the flat finger-piece R. The reader will readily see the advantages and the remaining defects of this apparatus. It is very portable, because the telescope is easily disengaged from it, and the legs and stay fold up. If the joint Q were immediately under A, it would be much freer from all tremor in the vertical plane. But nothing can hinder other tremors arising from the long pillar and the three springy legs. These communicate all external agitations with great vigour. The instrument should be set on a stone pedestal, or, what is better, a cask filled with wet sand. This pedestal, which necessity perhaps suggested to our scientific navigators, is the best that can be imagined.

Fig. 23 is the stand usually given to reflecting telescopes. The vertical tube FBG is fastened to the tube by finger screws, which pass through the slits at F and G. This arch turns round a joint in the head of the divided pillar, and has its edge cut into an oblique rack, which is acted on by the horizontal screw, furnished with the finger-piece A. This screw turns in a horizontal square frame. This frame turns round a horizontal joint in the offset, which cannot be seen in this view. In the side of this frame next the eye there is a finger-screw a, which passes through the frame, and presses on the round horizontal plate D. By screwing down this finger-screw, the frame is brought up, and presses the horizontal screw to the rack. Thus the elevation of the telescope is fixed, and may be nicely changed by the finger applied to A and turning this screw. The horizontal round plate D moves stiffly round on another plate of nearly equal diameter. This under plate has a deep conical hollow socket, which is nicely fitted by grinding to a solid cone formed on the top of the great upright pillar, and they may be firmly fixed in any position by the finger-screw E. To the under plate is fastened a box c, containing a horizontal screw C, which always works in a rack cut in the edge of the upper plate, and cannot be disengaged from it. When a great vertical or horizontal motion is wanted, the screws a and E are slackened, and by tightening them the telescope may be fixed

telescope fixed in any position, and then any small movements may be given it by the finger plates A and C.

This stand is very subject to brisk tremor, either from external agitation of the pedestal, or from the immediate action of the wind; and we have seldom seen distinctly through telescopes mounted in this manner, till one end of the tube was pressed against something that was very steady and unelastic. It is quite astonishing what a change this produces. We took a very fine telescope made by James Short, and laid the tube on a great lump of soft clay, pressing it firmly down into it. Several persons, ignorant of our purpose, looked through it, and read a table of logarithms at the distance of 310 yards. We then put the telescope on its stand, and pointed it to the same object; none of the company could read at a greater distance than 235 yards, although they could perceive no tremor. They thought the vision as sharp as before; but the incontrovertible proof of the contrary was, that they could not read at such a distance.

If the round plates were of much greater dimensions; and if the lower one, instead of being fixed to the pillar, were supported on four stout pillars standing on another plate; and if the vertical arch had a horizontal axis turning on two upright frames firmly fixed to the upper plate—the instrument would be much freer from tremor. Such stands were made formerly; but being much more bulky and inconvenient for package, they have gone into disuse.

The high magnifying powers of Dr Herschel's telescopes made all the usual apparatus for their support extremely imperfect. But his judgment, and his ingenuity and fertility in resource, are as eminent as his philosophical ardour. He has contrived for his reflecting telescopes stands which have every property that can be desired. The tubes are all supported at the two ends. The motions, both vertical and horizontal, are contrived with the utmost simplicity and firmness. We cannot more properly conclude this article than with a description of his 40 feet telescope, the noblest monument of philosophical zeal and of princely munificence that the world can boast of.

Plat DV. represents a view of this instrument in a meridional situation, as it appears when seen from a convenient distance by a person placed to the south-west of it. The foundation in the ground consists of two concentric circular brick walls, the outermost of which is 42 feet in diameter, and the inside one 21 feet. They are two feet six inches deep under ground; two feet three inches broad at the bottom, and one foot two inches at the top; and are capped with paving stones about three inches thick, and twelve and three quarters broad. The bottom frame of the whole apparatus rests upon these two walls by twenty concentric rollers III, and is moveable upon a pivot, which gives a horizontal motion to the whole apparatus, as well as to the telescope.

The tube of the telescope A, though very simple in its form, which is cylindrical, was attended with great difficulties in the construction. This is not to be wondered at, when its size, and the materials of which it is made, are considered. Its length is 39 feet four inches; it measures four feet ten inches in diameter; and every part of it is of iron. Upon a moderate computation, the weight of a wooden tube must have exceeded an iron one at least 3000 pounds; and its durability would have been far inferior to that of iron. It is made of rolled or sheet iron, which has been joined together without rivets, by a kind of seaming well known to those who make iron-funnels for stoves.

Very great mechanical skill is used in the contrivance of the apparatus by which the telescope is supported and directed. In order to command every altitude, the point of

support is moveable; and its motion is effected by mechanism, so that the telescope may be moved from its most backward point of support to the most forward, and, by means of the pulleys GG suspended from the great beam H, be set to any altitude, up to the very zenith. The tube is also made to rest with the point of support in a pivot, which permits it to be turned sidewise.

The concave face of the great mirror is 48 inches of polished surface in diameter. The thickness, which is equal in every part of it, remains now about three inches and a half; and its weight, when it came from the cast was 2118 pounds, of which it must have lost a small quantity in polishing. To put this speculum into the tube, it is suspended vertically by a crane in the laboratory, and placed on a small narrow carriage, which is drawn out, rolling upon planks, till it comes near the back of the tube; here it is again suspended and placed in the tube by a peculiar apparatus.

The method of observing by this telescope is by what Dr Herschel calls the *front view*; the observer being placed in a seat C, suspended at the end of it, with his back towards the object he views. There is no small speculum, but the magnifiers are applied immediately to the first focal image.

From the opening of the telescope, near the place of the eye-glass, a speaking pipe runs down to the bottom of the tube, where it goes into a turning joint; and after several other inflections, it at length divides into two branches, one going into the observatory D, and the other into the work-room E. By means of the speaking pipe the communications of the observer are conveyed to the assistant in the observatory, and the workman is directed to perform the required motions.

In the observatory is placed a valuable sidereal time-piece, made by Mr Shelton. Close to it, and of the same height, is a polar distance piece, which has a dial-plate of the same dimensions with the time-piece: this piece may be made to show polar distance, zenith distance, declination or altitude, by setting it differently. The time and polar distance pieces are placed so that the assistant sits before them at a table, with the speaking-pipe rising between them; and in this manner observations may be written down very conveniently.

This noble instrument, with proper eye-glasses, magnifies above 6000 times, and is the largest that has ever been made. Such of our readers as wish for a fuller account of the machinery attached to it, viz. the stairs, ladders, and platform B, may have recourse to the second part of the Transactions of the Royal Society for 1795; in which, by means of 18 plates and 63 pages of letter-press, an ample detail is given of every circumstance relating to joiner's work, carpenter's work, and smith's work, which attended the formation and erection of this telescope. It was completed on August the 28th 1789, and on the same day was the sixth satellite of Saturn discovered.

TELL (William), an illustrious Swiss patriot, chief instrument of the revolution which delivered the Swiss cantons from the German yoke in 1307. Griser, the governor of these provinces for the emperor Albert, having ordered him, under pain of death, to shoot at an apple placed on the head of one of his children; he had the dexterity, though the distance was very considerable, to strike it off without hitting the child. The tyrant, perceiving he had another arrow concealed under his cloak, asked him for what purpose? To which he boldly replied, "To have shot you thro' the heart, if I had had the misfortune to kill my son." The enraged governor now ordered him to be hanged; but his fellow-citizens, animated by his fortitude and

Telescope,
Tell.

Tell
Temper.

patriotism, flew to arms; attacked and vanquished Griser, who was shot to death by Tell; and the association for the independency took place that instant.

TELL-Tale, a name sometimes given to the *Perpetual-Loos*. See that article.

TELLER, an officer of the exchequer, in ancient records called *tallie*. There are four of these officers, whose duty is to receive all sums due to the king, and to give the clerk of the pells a bill to charge him therewith. They likewise pay all money due from the king, by warrant from the auditor of the receipt; and make weekly and yearly books both of their receipts and payments, which they deliver to the lord treasurer.

TELLINA, in natural history, a genus of animals belonging to the class of *vermes*, and order of *testacea*. The animal is a tethys; the shell is bivalve, generally sloping to one side, with three teeth at the hinge. Gmelin reckons about 90 species.

The tellinæ bury themselves in the mud or sand at the bottom of the sea, keeping a communication with the water above by means of short tubes or pipes.

TEMISSA, a large town in Africa, about 120 miles north-east of Mourzouk, the capital of Fezzan. Here the caravan of pilgrims from Bornou and Nigritia, which takes its departure from Mourzouk, and travels by the way of Cairo to Mecca, usually provides the stores of corn and dates, and dried meat, that are requisite for its dreary passage.

TEMPE (anc. geog.), a most pleasant place or valley of Thessaly. That it was there, appears from the epithets *Thessalica* (Livy), *Thessala* (Ovid); but in what particular district is the question. From the Phthiotica of Catullus, it should seem to be of Phthiotis: but the Peneus, which ran through Tempe, was at too great a distance, being separated from it by Mount Othrys and others. First, however, we shall define Tempe, previous to the determining the particular district in which it lay. The Peneus, according to Pliny, running down between Ossa to the south and Olympus to the north for 500 stadia, is for half that space navigable: in the direction of this course lies what is called *Tempe*, extending in length for five miles, in breadth for almost an acre and an half, with gentle convexities rising on the right and left beyond ken of human sight. Within glides the Peneus in its verdant light, green in its pebbles, charming in the grass on its banks, harmoniously vocal with the music of birds. In this description Strabo and Ælian agree; the last adding, that it has an agreeable variety of places of retreat; and that it is not the work of man's hand, but the spontaneous production of nature; and Strabo says, that formerly the Peneus formed a lake in this spot, being checked in its course by the higher grounds about the sea; but that an opening being made by an earthquake, and Mount Ossa torn from Olympus, the Peneus gained a free course between them. But Livy, who calls Tempe a grove, remarks a degree of horror rather than amenity, with which the Roman army was struck on marching over the narrow pass; for, besides the defile, difficult to go over, which runs on for five miles, there are steep rocks on each hand, down which the prospect is apt to cause a dizziness, heightened by the noise and depth of the intersuent Peneus. Hence it appears that Tempe was in the Pelasgiotis, whose extremity was formerly the Peneus, but afterwards, as is probable, allotted to Magnesia; and thus Pliny places the mouth of the Peneus not in Thessaly itself, but in the Magnesia of Thessaly.

TEMPER, in a mechanical sense. See **TEMPERING**.

TEMPER, in a moral sense, the disposition of mind whe-

ther natural or acquired. The word is seldom used by good writers without an epithet, as a *good* or *bad* temper; though one of the most beautiful poems in the language is entitled *The Triumphs of Temper*.

It is well observed by an elegant essayist, that more constant uneasiness arises from ill temper than from ill fortune; as a bad temper embitters every sweet, and converts a paradise into a place of torment. For subduing the heart to softness, and preserving a due balance of the passions, a proper culture of the understanding and of the taste is the best method. He who employs his time in the studies of elegant literature, or the fine arts, has almost always a good temper; whilst the man who is absorbed in the pursuits of profound science is apt to acquire a severity or disposition, little less disagreeable, though generally much less pernicious, than the capriciousness of the idler. Music, painting, and poetry, teach the mind to select the agreeable parts of those objects which surround us, and by habituating it to a pure and permanent delight, gradually superinduce an habitual good humour. It is of infinite importance to happiness to accustom the mind, from infancy, to turn from deformed and painful scenes, and to contemplate whatever can be found of moral and natural beauty.

So much of the happiness of private life depends on the government of the temper, that the temper ought to be a principal object of regard in a well-conducted education. The suffering of children to tyrannize without controul over servants and inferiors, is the ruin of many an amiable disposition. The virtues of humanity, benevolence, humility, cannot be too early enforced; at the same time, care should be taken that an infant of two or three years old should never be beaten or spoken to harshly for any offence which it can possibly commit.

TEMPERAMENT, among physicians, the same with constitution, or a certain disposition of the solids and fluids of the human body, by which it may be properly denominated strong, weak, lax, &c.

In every person there are appearances of a temperament peculiar to himself, though the ancients only took notice of four, and some have imagined these were deduced from the theories of the four humours or four cardinal qualities; but it is more probable that they were first founded on observation, and afterwards adapted to those theories, since we find that they have a real existence, and are capable of receiving an explanation. The two that are most distinctly marked are the sanguineous and melancholic, viz. the temperaments of youth and age.

1. *Sanguineous*. Here there is laxity of solids, discoverable by the softness of hair and succulency; large system of arteries, redundancy of fluids, florid complexion; sensibility of the nervous power, especially to pleasing objects; irritability from the plethora; mobility and levity from lax solids. These characters are distinctly marked, and are proved by the diseases incident to this age, as hæmorrhages, fevers, &c. but these, as they proceed from a lax system, are more easily cured.

2. *Melancholic Habit*. Here greater rigidity of solids occurs, discoverable by the hardness and crispature of the hair; small proportion of the fluids, hence dryness and leanness; small arteries, hence pale colour; venous plethora, hence turgescency of these, and lividity; sensibility, frequently exquisite; moderate irritability, with remarkable tenacity of impressions; steadiness in action and slowness of motion, with great strength; for excess of this constitution in maniacs gives the most extraordinary instance of human strength we know. This temperament is most distinctly marked in old age, and in males. The sanguineous tempera-

ment of youth makes us not distinguish the melancholic till the decline of life, when it is very evident, from diseases of the veins, hemorrhoids, apoplexy, cachexy, obstructions of the viscera, particularly of the liver, dropsies, affections of the alimentary canal, chiefly from weaker influence of the nervous power. So much for the sanguineous and melancholic temperaments; the other two are not so easily explained. The choleric temperament takes place between youth and manhood. In the

3. *Choleric*, the distribution of the fluids is more exactly balanced; there is less sensibility, and less obesity, with more irritability, proceeding from greater tension, less mobility and levity, and more steadiness in the strength of the nervous power. As to the

4. *Phlegmatic*. This temperament cannot be distinguished by any characters of age or sex. It agrees with the sanguineous in laxity and succulency. It differs from that temperament, and the melancholic, by the more exact distribution of the fluids. Again, it differs from the sanguineous, by having less sensibility, irritability, mobility, and perhaps strength, though sometimes indeed this last is found to be great.

These are the ancient temperaments. The temperaments, indeed, are much more various; and very far from being easily marked and reduced to their genera and species, from the great variety which is observable in the constitutions of different men.

TEMPERAMENT, in music, is defined by Rousseau to be an operation which, by means of a slight alteration in the intervals, causes the difference between two contiguous sounds to disappear, makes each of these sounds seem identical with the other, which, without offending the ear, may still preserve their respective intervals or distances one from the other. By this operation the scale is rendered more simple, and the number of sounds which would otherwise be necessary retrenched. Had not the scale been thus modified, instead of twelve sounds alone, which are contained in the octave, more than sixty would be indispensably required to form what we properly call *modulation* in every tone.

It is proved by computation, that upon the organ, the harpsichord, and every other instrument with keys, there is not, and there scarcely can be, any chords properly in tune, save the octave alone. The cause is this, that though three thirds major, or four thirds minor, ought to form a just octave, those are found to surpass, and these not to reach it.

TEMPERANCE, that virtue which a man is said to possess who moderates and restrains his sensual appetites. It is often, however, used in a much more general sense, as synonymous with moderation, and is then applied indiscriminately to all the passions.

Temperance (says Mr Nelson) is the virtue that bridles our irregular desires; it is nearly allied to prudence, and has a close connection with justice; it calms revenge, and quenches the fire of unjust resentment: it checks the Epicure, and stops the riotous hand of the Bacchanalian; it extinguishes or abates the flames of lust, and banishes every lawless action; it silences the sipping detracting tongue, and gives in its stead a pleasing moderation of speech; it shuts the door against avarice, and proves experimentally, that happiness does not consist in the eager pursuit or acquisition of riches, but in a contented mind; it curbs the strongest of all other passions, gaming, and distinguishes justly the absurdity and folly of making that a dangerous trade, which was only designed as a relaxation and an amusement: temperance, in a word, is the parent of many virtues; the parent of peace, prosperity, health, and joy.

Nothing can be more strange to all observation than the practice of forsaking temperance; since every day's experience proves to us, that intemperance produces the opposite to what we seek. Suppose, when a child is born, we ask the parents what it is they wish in that child; they will answer, life. But as life alone, that is, mere existence, may, by infirmity or other accidents, be very wretched, they will naturally wish for health and happiness. Well then, life, health, and happiness, are the general wishes of parents for their children. Now let us see how their wishes are likely to succeed. Their first step is usually a shameful neglect of the food of nature, the breast; the next, a blind gratification of their will; the third, an almost total neglect of their manners; and a fourth, the cherishing them in every irregular affection. Where then is the wonder that parents are disappointed? Life and health depend on proper food and other judicious management on one part; and if sick, an obedience to remedies on the other part; and happiness essentially depends in the first place on health: in the next, on the due government of our senses, affections, and passions. See here how much mankind deviate from themselves; how far they depart from their own principles. But what is the remedy? Nothing more obvious. Let parents exercise their reason in all the steps they take for their children's welfare; let them examine right and wrong; let them not only avoid passion, but labour to correct their own errors of judgment, that they may be the better enabled to prevent them in their children; but, particularly, let them fix in them the knowledge, love, and habit, of temperance.

TEMPERING, in the mechanic arts, the preparing of steel and iron, so as to render them more compact, hard, and firm; or even more soft and pliant, according to their respective occasions. See IRON and STEEL.

TEMPESTA. See MOLYN.

TEMPLARS, *TEMPLERS*, or *Knights of the Temple*, a religious order instituted at Jerusalem in the beginning of the 12th century, for the defence of the holy sepulchre and the protection of Christian pilgrims. They were first called *The poor of the Holy City*, and afterwards assumed the appellation of *Templers*, because their house was near the temple. The order was founded by Baldwin II. then king of Jerusalem, with the concurrence of the pope; and the principal articles of their rule were: That they should hear the holy office throughout every day; or that, when their military duties should prevent this, they should supply it by a certain number of pater nosters: that they should abstain from flesh four days in the week, and on Fridays from eggs and milk-meats: that each knight might have three horses, and one esquire: and that they should neither hunt nor fowl. After the ruin of the kingdom of Jerusalem about 1186, they spread themselves through Germany and other countries of Europe, to which they were invited by the liberality of the Christians. In the year 1228, this order acquired stability, by being confirmed in the council of Troyes, and subjected to a rule of discipline drawn up by St Bernard. In every nation they had a particular governor, called *master of the Temple*, or of the *militia of the Temple*. Their grand-master had his residence at Paris.

The order of Templars flourished for some time, and acquired, by the valour of its knights, immense riches and an eminent degree of military renown: but as their prosperity increased, their vices were multiplied, and their arrogance, luxury, and cruelty rose at last to such a monstrous height, that their privileges were revoked, and their order suppressed with the most terrible circumstances of infamy and severity. Their accusers were two of their own body, and their chief prosecutor Philip the Fair of France, who addressed his complaints

Templars.

Templars plants to Clement V. The pope, though at first unwilling to proceed against them, was under a necessity of complying with the king's desire; so that, in the year 1307, upon an appointed day, and for some time afterwards, all the knights, who were dispersed throughout Europe, were seized and imprisoned, and many of them, after trials for capital crimes, were convicted and put to death. In 1312 the whole order was suppressed by the council of Vienne. A part of the rich revenues they possessed was bestowed upon other orders, especially on the knights of St John, now of Malta, and the rest confiscated to the respective treasuries of the sovereign princes in whose dominions their possessions lay.—The knights Templars, in order to justify the severity with which they were treated, were charged with apostasy to the Saracens, and holding correspondence with them, with insulting the majesty of God, turning into derision the gospel of Christ, and trampling upon the obligation of all laws human and divine. Candidates, it is said, upon admission to this order, were commanded to spit, in token of contempt, upon an image of Christ, and after admission to worship either a cat or a wooden head crowned with gold. It is farther affirmed, that, among them, the odious and unnatural act of sodomy was a matter of obligation; and they are charged with other crimes too horrible to be mentioned, or even imagined. However, though there be reason to believe, that in this order, as well as others of the same period, there were shocking examples of impiety and profligacy; yet that the whole order was thus enormously corrupt, there is no reason to believe. The pope indeed, though he acted with severity, acted with justice. He sent two cardinals to Paris, who, publishing his bull against the order, condemned those Templars who had made the voluntary confession to be burnt by a slow fire. The criminals recanted their former confessions, but acknowledged themselves worthy of death, because they had unjustly accused the order of crimes of which they were innocent. Several authors of those times wrote in defence of the order; and Boece alleges, that its extirpation was owing to the avarice of the king of France, who coveted the rich possessions the Templars then enjoyed in France.

The king of Arragon was much pressed to treat the Templars in his kingdom as they had been treated in France; but his constant answer was, "We must be first convinced of their guilt, and it will be then time enough to talk of their punishment." The people, however, were in general so provoked against them, that they were compelled to shut themselves up in the fortresses belonging to their order, to prevent their being torn in pieces; which precaution was represented to the king of Arragon as an act of rebellion. He marched, therefore, with a corps of troops against one of these fortresses. The knight who commanded surrendered immediately, and told the king the truth, assuring him that they desired nothing but a fair trial; with which declaration the king was extremely moved, took the whole order into his protection, and forbade any to abuse or insult them under the heaviest penalties. At the same time he declared, he was ready to receive any informations against them that were supported by proofs; but if the informers failed therein, he would punish them as they deserved.

These facts plead strongly for the innocence of the Templars, or at least they prove that their guilt must have been exaggerated; and if we add, that many of the accusations advanced against them flatly contradict each other, and that many members of this unfortunate order solemnly avowed their innocence while languishing under the severest tortures, and even with their dying breath—it would seem probable, that king Philip set on foot this bloody tragedy, with

a view to gratify his avarice, and glut his resentment against the Templars, and especially against their grand master, who had highly offended him. The principal cause of his invincible hatred against them was, that in his quarrel with Boniface VIII. the knights espoused the cause of the pope, and furnished him with money to carry on the war. They originally wore a white habit, with red crosses sewed upon their cloaks as a mark of distinction.

TEMPLE (Sir William), was born in London in the year 1625. The family from which he sprung was ancient, and is said to have assumed the surname of Temple from the manor of Temple, in the hundred of Sparken-Hall, in Leicestershire. He was first sent to school at Penshurst, in Kent, under the care of his uncle, the celebrated Dr Hammond, then minister of that parish; but at the age of ten he was removed thence to a school at Bishop-Stortford, in Hertfordshire. When he had acquired a sufficient knowledge of the Greek and Latin, he returned home at the age of fifteen; and, two years after, he went to Cambridge, where he was placed under the tuition of the learned Dr Cudworth, then fellow of Emanuel College. His father, Sir John Temple, being a statesman, seems to have designed him for the same way of life; and on this account, after residing at Cambridge two years, which were principally spent in acquiring a competency of French and Spanish, both languages exceedingly useful for his intended pursuits, he was sent abroad to finish his education.

Mr Temple began his travels by visiting France in 1648. As he chote to pass through the Isle of Wight, where his majesty was detained a prisoner, he there accidentally met with the second daughter of Sir Peter Osborn of Chickland, in Bedfordshire, then governor of Guernsey for the king; and this lady being on a journey with her brother to St Maloes, where their father then was, our young traveller joined their party. This gave rise to an honourable amour, which, at the end of seven years, concluded in a happy marriage. Having resided two years in France, and learned the French language perfectly, Mr Temple made a tour through Holland, Flanders, and Germany, during which he became completely master of the Spanish. In 1654 he returned from the continent, and, marrying Miss Osborn, passed his time in retirement with his father, his two brothers, and a sister, then in Ireland, happy in that perfect harmony which has been so often remarked in their family.

As he rejected all offers made him of employment under Cromwell, the five years which he lived in Ireland were spent chiefly in improving himself in history and philosophy; but at the Restoration, in 1660, being chosen a member of the convention there, while others were trying to make their court to the king, Mr Temple opposed the poll-bill with so much spirit, that his conduct soon attracted the attention of the public, and brought him into notice. In the succeeding parliament, in 1661, he was elected with his father for the county of Carlow; and, in the year following, he was chosen one of the commissioners to be sent from that parliament to the king, which gave him an opportunity of waiting on the duke of Ormond, the new lord-lieutenant, then at London. Soon after he went back to Ireland but with a resolution of quitting that kingdom, and of removing with his family to England.

On his return he met with a very favourable reception from the duke of Ormond; and soon acquired such a considerable share in his esteem, that the duke complained of him as the only man in Ireland that had never asked any thing from him. When he mentioned his design of carrying his family to England, his grace said, that he hoped he would

would at least give him leave to write in his favour to the two great ministers, Clarendon then lord chancellor, and the earl of Arlington, who was secretary of state. This the king did in such strong terms, as procured him the friendship of these two noblemen, as well as the good opinion of the king. Mr Temple, however, made no other use of this advantage than to tell lord Arlington, that if his majesty had any employment abroad, which he was fit for, he should be happy to undertake it; but, at the same time, he requested that he might not be sent into any of the northern climates, to which he had a very great aversion. Lord Arlington replied, he was very sorry he had made such an objection, as there was no other employment then undisposed of except that of going envoy to Sweden. However, in 1665, about the beginning of the first Dutch war, lord Arlington sent a messenger to acquaint him that he must immediately come to his house; which he did, and found that his lordship's business was to tell him, that the king had occasion to send some person abroad upon an affair of the utmost importance, and that he had resolved to make him the first offer; but that he must know, without delay, and without telling him what it was, whether he would accept of it, and that he must be ready to set out in two or three days, without mentioning it to any of his friends. After a little consideration, Mr Temple told his lordship, that, as he took him to be his friend, and as he had advised him not to refuse, as it would be an entrance into his majesty's service, he should consult no farther. This business was to carry a secret commission to the bishop of Munster; which he set out with on the second of August, and executed so much to the satisfaction of Charles II. that, on his return to Brussels, his majesty appointed him resident there, and created him a baronet. As Brussels was a place which he had long wished to reside at, in April 1666 he sent for his family; but, before their arrival, he had been again obliged to depart upon business to the prelate's court: for the bishop having listened to terms of accommodation with France, Sir William wrote two letters to dissuade him from that alliance; and these not having the desired effect, he went in disguise to Munster, where, though he arrived too late to secure the prince in his first engagement, yet he prevailed on him to permit five or six thousand of his best troops to enter into the Spanish service. In this journey he passed for a Spanish envoy, having twenty Spanish guards to attend him. In this manner he first went to Dusseldorp, where the duke of Newburgh, though in the French interest, gave him a guard to Dortmund; but when he reached that place, finding the gates shut, he was forced to proceed to a village, at the distance of a league, which, being full of Brandenburg troops, he was under the necessity of lodging in a barn, upon a straw bed, with his page for a pillow. Next day he was entertained at a castle belonging to the bishop of Munster, by one Gorges a Scotch lieutenant-general in that prelate's service, with what he calls a very episcopal way of drinking. The general coming to the large hall, in which stood a great many flag-gons ready charged, he called for wine to drink the king's health. A silver bell, that might hold about two quarts, was upon this brought him; and, as soon as he received it, he pulled out the clapper, and giving it to Sir William, to whom he intended to drink, ordered the bell to be filled. When this was done, he drank off the contents to his majesty's health; and asking Sir William for the clapper, put it on, and turning down the bell, rang it, to shew that he had drank fair, and left nothing in it. He then took out the clapper, desired Sir William to give it to whomsoever he pleased; and, ordering the bell to be filled again, presented it to Sir William: but as the latter seldom used to

drink, he had generally some gentleman with him to supply his place in this respect whenever it might be necessary. Having finished his business at Munster, he returned to Brussels, where he passed a year with great pleasure and satisfaction.

Two months after the conclusion of the peace with the Dutch at Breda, Sir William's sister, who resided with him at Brussels, being very desirous of seeing Holland, he went thither incognito to gratify her desire: but while he was at the Hague, he paid a private visit to Mr De Witt, in which he laid the foundation of that close intimacy which afterwards subsisted between them.

In the spring of 1667, a new war breaking out between France and Spain, which exposed Brussels to the danger of falling into the hands of the former, Sir William sent his lady and family to England; but he himself remained there with his sister till the Christmas following, when he was ordered by the king to come over privately to London. Taking the Hague in his way, he paid another visit to De Witt, and, pursuant to his instructions, proposed those overtures to him which produced the triple alliance. Soon after his arrival at the British court, he returned, on the 16th of January 1668, with the character of envoy extraordinary and plenipotentiary to Holland; where a conference being opened, he brought that treaty to a perfect conclusion in the short space of five days. The ratifications of this alliance being exchanged on the 15th of February, he repaired to Brussels; and a treaty being set on foot between France and Spain at Aix-la-Chapelle, he set out for that place on the 24th of April in quality of his majesty's ambassador extraordinary and mediator. Here he arrived on the 27th: and it was chiefly owing to his assistance that the Spaniards were brought to sign the articles of that peace on the second of May. This service being completed, he returned to Brussels, with a view of remaining there in his former station of resident; but he received letters from the earl of Arlington, with the king's order to continue as ambassador, and to serve his country in that quality in Holland, as, on account of the late alliances, his majesty was resolved to renew a character which the crown of England had discontinued there since the time of king James. Sir William being now left at liberty to return to England, embraced the opportunity; and, upon his arrival at London, he was received with every possible demonstration of favour both by the king and the court.

Setting out again for Holland, with his new character of the king's ambassador, he arrived at the Hague in the end of August 1668. Here he enjoyed the confidence of that great minister De Witt, and lived in great intimacy with the prince of Orange, who was then only eighteen years of age; but, in September 1669, he was hurried back to England by lord Arlington, who ordered him to put his foot in the stirrup as soon as he should receive his letter. When Sir William waited on the earl, he found that he had not one word to say to him; for, after making him attend a long time, he only asked him a few indifferent questions respecting his journey. Next day he was received as coolly by the king; but the secret soon came out, and he was pressed to return to the Hague, and pave the way for a war with Holland. This, however, he excused himself from having any hand in; which so much provoked the lord treasurer Clifford, that he refused to pay him an arrear of two thousand pounds due from his embassy. Disgusted with Arlington's behaviour, which was so unlike the friendship he had formerly professed, Sir William now retired to his house at Sheen near Richmond, in Surry; and in this retreat, when free from the hurry of business, he wrote his Observations on the United Provinces, and one part of his Miscellanies, in the

Temple's
 nature of the second Dutch war. About the end of summer, however, 1672, the king willing to put an end to the war, sent for Sir William, and desired him to go to Holland to negotiate a peace; but powers having been sent from thence at this time to the Marquis de Fresno, the Spanish ambassador at London, Sir William was ordered to confer with him; and a treaty was accordingly concluded in three days, and the point carried respecting the superiority of the British flag, which had been long contested. In June 1674 he was again sent an ambassador to Holland to offer the king's mediation between France and the confederates, then at war, which was accepted not long after; Lord Berkeley, Sir William Temple, and Sir Leoline Jenkins, being declared ambassadors and mediators; and Nimeguen, which Sir William had proposed, was at length agreed upon by all parties to be the place of treaty. During his stay at the Hague, the prince of Orange, who was fond of the English language, and of the plain English way of eating, constantly dined and supped once or twice a week at his house; and by this familiarity he so much gained the prince's confidence and esteem, that he had a considerable hand in his marriage with the Princess Mary, daughter of James II.

In July 1676 he removed his family to Nimeguen, where he spent the remainder of that year without making any progress in the treaty; and the year following his son was sent over with letters from the lord treasurer, ordering him to return, and succeed Mr Coventry as secretary of state. In consequence of this order, Sir William came over to England in the spring of 1677; and though the affair of the secretary's place was dropped at his desire, he did not return to Nimeguen that year. About this time, the prince having the king's leave to come over, he soon after married the Princess Mary; and this gave occasion for a new coolness between lord Arlington and Sir William, as he and the lord treasurer Osborn, who was related to Sir William's lady, were only privy to that affair. After the prince and princess were gone to Holland, as the court always seemed inclined to favour France, the king wished to engage Sir William in some negotiations with that crown: but he was so ill satisfied with this proposal, that he offered to give up all pretensions to the office of secretary; and desiring the lord treasurer to acquaint his majesty with his intentions, retired to Sheen, in hopes of being taken at his word. Upon a discovery, however, of the French designs not to evacuate the Spanish towns agreed by the treaty to be delivered up, the king commanded him to go upon a third embassy to the states; with whom he concluded a treaty: by which England engaged, in case France refused to evacuate the towns in forty days, to declare war immediately against that nation: but before half that time was elapsed, one Du Crois was sent from the English court to Holland upon a business which damped all the good humour excited by the treaty there, and which produced such sudden and astonishing changes in this country, as gave Sir William a distaste for all public employments.

In 1679 he went back to Nimeguen, where the French delayed to sign the treaty till the last hour; but having concluded it, he returned to the Hague, whence he was soon after sent for to enter upon the secretary's office, which Mr Coventry at length resolved to resign. He accordingly came over, and went to court, as all his friends hoped, with a full intention of assuming his office; but he started some difficulty, because he had not a seat in the house of commons, thinking that, by his not being a member, the public business would suffer at such a critical time, when the contests between the two parties ran so high that the king thought fit to send the duke of York into Flanders, and the parliament to put the lord treasurer Danby into the

Tower. After this his majesty still pressed Sir William to be secretary of state; using as an argument for his compliance, that he had nobody to consult with at a time when he had the greatest need of the best advice. Notwithstanding all this, Sir William declined the king's offer, advising him to choose a council in whom he could confide, and upon whose abilities he could depend. This advice the king followed; and the choice of the persons being concerted between his majesty and Sir William, the old council was dissolved four days after, and the new one established, of which the latter was a member.

In 1680 the councils began again to be changed, on the king's illness, at the end of summer, and the duke of York's return privately to court. In this juncture Sir William, endeavouring to bring to the king's favour and behalf some persons to whom his majesty had taken a dislike, it not an aversion, he met with such treatment from them as gave him a fresh distaste to the court, at which he seldom made his appearance; so that he retired principally at Sheen. Soon after this the king sent for him again; and having proposed that he should go as ambassador into Spain, Sir William consented: but when his equipage was almost ready, and part of the money paid down for it, the king changed his mind, and told him that he would have him defer his journey till the end of the session of parliament, in which he was chosen a member for the university of Cambridge. In this session the spirit of party ran so high that it was impossible to bring the house to any kind of temper. The duke was sent into Scotland; but this would not satisfy them, nor any thing but a bill of exclusion; which Sir William strenuously opposed, saying, that "His endeavour ever should be to unite the royal family, and that he would never enter into any councils to divide them." Not long after this period, the parliament being dissolved by his majesty, without the advice of his privy council, and contrary to what he had promised, Sir William made a bold speech against it; for which he was very ill used by some of those friends who had been most earnest in promoting the last change in the ministry. Upon this he grew quite tired of public business, declined the offer he had of again serving for the university in the next parliament, that was soon after called, and met at Oxford; and seeing his majesty resolved to govern without his parliament, and to supply his treasury through another channel, he retired to Sheen a few days after, whence he sent word by his son, that "he would pass the rest of his days like a good subject, but would never more meddle with public affairs." From that time Sir William lived at this place till the end of that reign and for some time in the next; when having purchased a small seat, called *Moor Park*, near Farnham in Surry, which he conceived a great fondness for on account of its solitude and retirement, and its healthy and pleasant situation, and being much afflicted with the gout, and broken with age and infirmities—he resolved to spend the remainder of his life in this agreeable retreat. In his way thither, therefore, he waited on king James, who was then at Windsor, and begged his favour and protection to one "that would always live as a good subject, but, whatever might happen, never again enter upon any public employment;" desiring his majesty to give no credit to any thing he might hear to the contrary. The king, who used to say that Sir William Temple's character was always to be believed, promised him whatever he desired, gently reproached him for not entering into his service, which, he said, was his own fault; and kept his word as faithfully to Sir William as Sir William did to his majesty, during the surprising turn of affairs that soon after followed by the arrival of the prince of Orange. At the time of this happy revolution, in 1688, Moor-Park becoming un-

fafe, as it lay in the way of both armies, he went back to the houfe at Sheen, which he had given up to his fon; to whom he retired leave, though importunately begged, to go and meet the prince of Orange at his landing: but after king James's abdication, when the Prince reached Windfor, he went thither to wait upon his highness, and carried his fon along with him. The prince pressed him to enter into his service, and to be secretary of state; but his age and infirmities confirming him in the resolution he had made not to meddle any more with public affairs he was satisfied that his son alone should enjoy his majesty's favour. Mr John Temple was upon this appointed secretary at war; but he had hardly been a week in that office, when he resolved to put an end to his own existence; which he did on the 14th of April 1689, by throwing himself out of a boat, hired for that purpose, in shooting London-bridge; having first put stones into his pocket to make him sink speedily.

In 1694 Sir William had the misfortune to lose his lady, who was a very extraordinary woman, as well as an affectionate wife. He was then considerably turned of sixty; at which age he practised what he had so often declared to be his opinion, that "an old man ought then to consider himself of no farther use in the world except to himself and his friends." After this he lived four years, very much afflicted with the gout; and his strength and spirits being worn out by the infirmities of age, he expired in the month of January 1698. He died at Moor-Park, where his heart was buried in a silver box under the sun dial in his garden, opposite to a window from which he used to contemplate and admire the works of nature, with his sister, the ingenious lady Gifford. This was according to his will; in pursuance of which his body was privately interred in Westminster Abbey, and a marble monument erected in 1722, after the death of lady Gifford, who resembled him in genius as well as in person, and left behind her the character of one of the best and most constant friends in the world.

Sir William Temple's principal works are, 1. Memoirs from 1672 to 1692: They are very useful for those who wish to be acquainted with the affairs of that period. 2. Remarks upon the State of the United Provinces. 3. An Introduction to the History of England: This is a Sketch of a General History. 4. Letters written during his last embassies. And 5. Miscellanies, which contain a great many curious pieces that display considerable depth of thought. He was an accomplished gentleman, a sound politician, a patriot, and a great scholar. And if this great idea should perchance be shaded by some touches of vanity and spleen, the reader will be so candid as to consider, that the greatest, wisest, and the best of men, have still some failings and imperfections which are inseparable from human nature.

TEMPLE, *templum*, a public building, erected in honour of some deity, either true or false; and wherein the people meet to pay religious worship to the same. The word is formed from the Latin *templum*, which some derive from the Greek *τεμενιον*, signifying the same thing; and others from *τεμα*, *abscindo*, "I cut off, I separate," in regard a temple is a place separated from common uses; others with more probability derive it from the old Latin word *templare*, "to contemplate." It is certain the ancient augurs gave the name *templa* to those parts of the heavens which were marked out for the observation of the flight of birds. Their formula was this: *Templa resqua sunt*. Temples were originally all open, and hence received their name. See Phil. Trans. n^o 471. etc. 5. where we have an account of an ancient temple in Ireland of the same sort as our famous Stonehenge. The word *templum*, in its primary sense among the old Ro-

mans, signified nothing more than a place set apart and consecrated by the augurs, whether inclosed or open, in the city or in the fields. Temple.

Clemens Alexandrinus and Eusebius refer the origin of temples to the sepulchres built for the dead. This notion has been lately illustrated and confirmed by a variety of testimonies by Mr Farmer in his Treatise on the Worship of Human Spirits, p. 373, &c. Herodotus and Strabo will have the Egyptians to have been the first who built temples to the gods. The first erected in Greece is ascribed to Deucalion, by Apollonius, Argonaut. lib. iii. In antiquity we meet with many people who would not build any temples to their gods for fear of confining them to too narrow bounds. They performed their sacrifices in all places indifferently, from a persuasion that the whole world is the temple of God, and that he required no other. This was the doctrine of the magi, followed by the Persians, the Scythians, the Numidians, and many other nations mentioned by Herodotus. lib. i. Strabo, lib. xv. and Cicero in his second oration against Verres.

The Persians, who worshipped the sun, believed it would wrong his power to inclose him in the walls of a temple, who had the whole world for his habitation; and hence, when Xerxes ravaged Greece, the magi exhorted him to destroy all the temples he met with.

The Sicyonians would build no temple to their goddess Coronis; nor the Athenians, for the like reason, erect any statue to Clemency, who, they said, was to live in the hearts of men, not within stone walls.

The Bithynians had no temples but the mountains to worship on; nor had the ancient Germans any other but the woods.

Even some philosophers have blamed the use and building of temples, particularly Diogenes, Zeno, and his followers the Stoics. But it may be said, that if God hath no need of temples, men have need of places to meet in for the public offices of religion: accordingly temples may be traced back even into the remotest antiquity. See *Hospinian de Origine Templorum*.

The Romans had several kinds of temples; whereof those built by the kings, &c. consecrated by the augurs, and wherein the exercise of religion was regularly performed, were called, by way of eminence, *templa*, "temples." Those that were not consecrated, were called *ades*. The little temples, that were covered or roofed, they called *ediculae*. Those open, *favella*. Some other edifices, consecrated to particular mysteries of religion, they called *fana* and *delubra*.

All these kinds of temples, Vitruvius tells us, had other particular denominations, according to the form and manner of their construction, as will be hereafter specified.

Indeed the Romans outdid all nations with regard to temples: they not only built temples to their gods, to their virtues, to their diseases, &c. but also to their emperors, and that in their life time; instances whereof we meet with in medals, inscriptions, and other monuments. Horace compliments Augustus hereupon, and sets him above Hercules and all the heroes of fable; because those were admitted into temples only after their death, whereas Augustus had his temples and altars while living.

*Præsenti tibi maturos largimur honores;
Jurandasque tuum per nomen ponimus aras.*

Epist. ad Aug.

Suetonius, on this occasion, gives an instance of the modesty of that emperor, who would allow of no temples being erected to him in the city; and even in the provinces, where he knew it was usual to raise temples to the very proconsuls refused

Temple. refuse any but those erected in the name of Rome as well as his own.

The most celebrated temples among the Romans were the Capitol and Pantheon. They had also the temple of Saturn, which served for the public treasury; and the temple of Janus.

The temple at Jerusalem was similar in its plan to the **TABERNACLE**. The first temple was begun by Solomon about the year of the world 2997, and before Christ 1012 according to some chronologers, and finished in eight years. Great mistakes have been committed respecting the dimensions of this temple, by confounding the emblematical description of Ezekiel with the plain account of it in the books of Kings and Chronicles. It consisted of the holy of holies, the sanctuary, and a portico. The holy of holies was a square room of 20 cubits; the sanctuary, or holy place, was 40 cubits long and 20 broad, consequently the length of both these together was 60 cubits. The portico, which stood before the sanctuary, was 20 cubits long and 10 cubits broad. Whether the portico was separated by a wall from the rest of the temple or not, is not mentioned in scripture. If it was, the whole length of the temple, computing the cubit at 22 inches, did not exceed 110 feet in length and 36 feet 5 inches in breadth. In the portico stood the two brazen pillars called *Jachin* and *Boaz*, which, upon comparing and reconciling the seemingly different account in different places, appear to have been 40 cubits high and about 4 cubits diameter. The court probably at first extended all round the temple. Now we are told, that the court about the tabernacle was 100 cubits long and 50 broad; and as Solomon made every part of the temple about twice as large as the corresponding part in the tabernacle, we have reason to conclude, that the court around the temple was 200 cubits long and 100 broad. According to this description, which is taken from the scripture history, the temple of Solomon was by no means so large as it is commonly represented. Still, however, it was very magnificent in size and splendid in ornament. It was plundered of its treasures in the reign of Rehoboam, and repaired by Joash; it was again spoiled in the time of Ahaz and of Hezekiah; and after being restored by Josiah, was demolished by Nebuchadnezzar in the year of the world 3416, after it had stood 476 years according to Josephus, and according to Usher 428 years.

The second temple was built by the Jews, after their return from the Babylonish captivity, under the direction and influence of Zerubbabel their governor, and of Joshua the high-priest, with the leave and encouragement of Cyrus the Persian emperor, to whom Judea was now become a tributary kingdom. According to the Jews, this temple was destitute of five remarkable appendages, which were the chief glory of the first temple; viz. the ark and mercy-seat, the Shechinah, the holy fire on the altar, which had been first kindled from heaven, the urim and thummim, and the spirit of prophecy. This temple was plundered and profaned by Antiochus Epiphanes, who also caused the public worship in it to cease; and afterwards purified by Judas Maccabeus, who restored the divine worship; and after having stood five hundred years, rebuilt by Herod, with a magnificence approaching to that of Solomon's. Tacitus calls it *immensa opulentia templum*; and Josephus says, it was the most astonishing structure he had ever seen, as well on account of its architecture as its magnitude, and likewise the richness and magnificence of its various parts and the reputation of its sacred appurtenances. This temple, which Herod began to build about sixteen years before the birth of Christ, and so far completed in nine years and a half as to be fit for divine service, was at length destroyed by the Romans on the same month and day of the month

on which Solomon's temple was destroyed by the Babylonians. Templ.

The Indian temples, or pagodas, are sometimes of a prodigious size. They are commonly erected near the banks of the Ganges, Kistna, or other sacred rivers, for the benefit of ablution in the purifying stream. Where no river flows near the foot of the pagoda, there is invariably in the front of it a large tank or reservoir of water. These are, for the most part, of a quadrangular form, are lined with freestone or marble, have steps regularly descending from the margin to the bottom, and Mr Crauford observed many between three and four hundred feet in breadth. At the entrance of all the more considerable pagodas there is a portico, supported by rows of lofty columns, and ascended by a handsome flight of stone steps; sometimes, as in the instance of Tripetti*, to the number of more than a hundred. Under this portico, and in the courts that generally inclose the whole building, an innumerable multitude assemble at the rising of the sun; and, having bathed in the stream below, and, in conformity to an immemorial custom over all the East, having left their sandals on the border of the tank, impatiently await the unfolding of the gates by the ministring brahmin. The gate of the pagoda universally fronts the east, to admit the ray of the solar orb; and, opening, presents to the view an edifice partitioned out, according to M. Thevenot in his account of Chitanagar, in the manner of the ancient cave-temples of Elora, having a central nave or body; a gallery ranging on each side; and, at the farther end, a sanctuary, or chapel of the deity adored, surrounded by a stone balustrade to keep off the populace. Those who wish to peruse a more particular account of the Indian temples may consult Maurice's Indian Antiquities. See also **PAGODA** and **SPRINGHAM**.

TEMPLE, in architecture. The ancient temples were distinguished, with regard to their construction, into various kinds; as, *Temple in anta*, *Aedes in antis*. These, according to Vitruvius, were the most simple of all temples, having only angular pilasters, called *anta* or *parastata*, at the corners, and two Tuscan columns on each side of the doors. *Temple tetrastyle*, or simple *tetrastyle*, was a temple that had four columns in front and as many behind. Such was the temple of Fortuna Virilis at Rome. *Temple, prostyle*, that which had only columns in its front or fore side; as that of Ceres at Eleusis in Greece. *Temple, amphi-prostyle*, or *double prostyle*, that which had columns both before and behind, and which was also tetrastyle. *Temple, periptere*, that which had four rows of insulated columns around, and was exastyle, i. e. had six columns in front; as the temple of Honour at Rome. *Temple, diptere*, that which had two wings and two rows of columns around, and was also octostyle, or had eight columns in front; as that of Diana at Ephesus.

TEMPLES, among us, denote two inns of court in London, thus called, because anciently the dwelling-house of the knights-templars. At the suppression of that order, they were purchased by the professors of the common law, and converted into *brigitia* or inns. They are called the *inner* and *middle temple*, in relation to Essex-house; which was also a part of the house of the templars, and called the *outer temple*, because situated without Temple-Bar. In the middle temple, during the time of the templars, the king's treasure was kept; as was also that of the kings of France in the house templars at Paris. The chief officer was the *maister of the temple*, who was summoned to parliament in 47 Hen. III. and from him the chief minister of the temple church is still called *maister of the temple*.

TEMPLES, in anatomy. a double part of the head, reaching from the forehead and eyes to the two ears. The temples are chiefly formed of two bones called *os temporis*. These

temporal
nacity.

These parts, according to physicians, were called *tempora*, from their showing the age or time of a man by the colour of the hair, which turns white in this part before any other; which Homer seems to have been aware of, by his calling men *policrotaphi*, *q. d.* "grey-templed."

TEMPORAL, a term generally used for secular, as a distinction from ecclesiastical. Thus we say temporal lords, and spiritual or ecclesiastical lords.

TEMPORALITIES of Bishops, are the revenues, lands, tenements, and lay-fees, belonging to bishops, as they are barons and lords of parliament.

The custody of the temporalities of bishops forms a branch of the king's ordinary revenues (see *REVENUE*).—These, upon the vacancy of the bishopric, are immediately the right of the king, as a consequence of his prerogative in church matters; whereby he is considered as the founder of all archbishoprics and bishoprics, to whom, during the vacancy, they revert. And for the same reason, before the dissolution of abbeys, the king had the custody of the temporalities of all such abbeys and priories as were of royal foundation (but not of those founded by subjects), on the death of the abbot or prior. Another reason may also be given why the policy of the law hath vested this custody in the king; because, as the successor is not known, the lands and possessions of the see would be liable to spoil and devastation if no one had a property therein. Therefore the law has given the king, not the temporalities themselves, but the custody of the temporalities, till such time as a successor is appointed; with power of taking to himself all the intermediate profits, without giving any account to the successor; and with the right of presenting (which the crown very frequently exercises) to such benefices and other preferments as fall within the time of vacation. This revenue is of so high a nature, that it could not be granted out to a subject, before or even after it accrued: but now, by the statute 15 Edw. III. st. 4. c. 4 & 5. the king may, after the vacancy, lease the temporalities to the dean and chapter; saving to himself all advowsons, escheats, and the like. Our ancient kings, and particularly William Rufus, were not only remarkable for keeping the bishoprics a long time vacant, for the sake of enjoying the temporalities, but also committed horrible wastes on the woods and other parts of the estate; and to crown all, would never, when the see was filled up, restore to the bishop his temporalities again, unless he purchased them at an exorbitant price. To remedy which, king Hen. I. granted a charter at the beginning of his reign, promising neither to sell, nor let to farm, or take any thing from, the domains of the church, till the successor was installed. And it was made one of the articles of the great charter, that no waste should be committed in the temporalities of bishoprics, neither should the custody of them be sold. The same is ordained by the statute of Westminster the first; and the statute 14 Edw. III. st. 4. c. 4. (which permits a lease to the dean and chapter) is still more explicit in prohibiting the other exactions. It was also a frequent abuse, that the king would, for trifling or no causes, seize the temporalities of bishops, even during their lives, into his own hands: but this is guarded against by statute 1 Edw. III. st. 2. c. 2.

This revenue of the king, which was formerly very considerable, is now by a customary indulgence almost reduced to nothing: for, at present, as soon as the new bishop is consecrated and consumed, he usually receives the restitution of his temporalities quite entire and untouched from the king; and then, and not sooner, he has a fee-simple in his bishopric, and may maintain an action for the profits.

TENACITY, in natural philosophy, that quality of bodies by which they sustain a considerable pressure or force

of any kind without breaking. It is the quality opposite to fragility or brittleness. See *STRENGTH of Materials*.

TENACULUM, in surgery, an instrument used in amputation, for pulling out bleeding vessels that are to be tied by ligatures. See *SURGERY*.

TENAILLES and }
TENAILLIONS. } See *FORTIFICATION*, Sect. I. § 3 and 5.

TENANT, one that holds lands or tenements of some lord or landlord, by rent, fealty, &c. See *TENURE*.

TENAWWIT. See *LOXIA*, species 13.

TENCH, in ichthyology. See *CYPRINUS*, species 3.

TENDER, a small ship in the service of men of war, for carrying men, provisions, or any thing else that is necessary.

TENDONS, in anatomy, are white, firm, and tenacious parts, contiguous to the muscles, and usually forming their extremities. See *ANATOMY*, n° 85.

TENEBRIO, in natural history, a genus of insects belonging to the order of *Coleoptera*. The antennæ are moniliform, the last joint being roundish; the thorax is plano-convex and marginated; the head projecting, and the elytra are somewhat stiff. Gmelin enumerates about 63 species. The larvæ of some live in damp places under ground among rubbish; of others in flour and different kinds of food, where they undergo their metamorphosis. The perfect insects are very troublesome in houses; eating bread, meat, &c. They precipitately avoid the light; resorting in troops to dark damp cellars, where putrefaction allures and nourishes them. They are all of a very dark gloomy appearance, from which circumstance they take their name.

TENEDOS (anc. geog.), an island on the coast of Troas, at the distance of 40 stadia from the continent, and 80 in compass; with a cognominal Æolian town, and a temple of Apollo Smintheus. Its origin is derived from Tenæa or Tenes, who being exposed in a coffer or bog by his father Cygnus the Thracian, at the instigation of the mother-in-law, was by fate carried to this island, made king of it, and at length worshipped as a god on account of his virtues. The island was famous for its earthen ware, for which purpose it had an excellent red clay; and hence Bochart would derive the appellation from *tinedom*, a "red clay." *Tenedia securis*, is a proverbial saying to denote severity; from a law there passed, that persons found in the act of adultery should be put to death; a severity executed on the king's son; and therefore, in the coins of Tenedos, on one are two heads in memorial of the king and his son, and on the reverse an axe, (Aristotle). This island still retains its ancient name; and is one of the smallest islands of the Archipelago, situated near the coast of Lesser Asia, west of the ruins of Troy. It is chiefly rocky, but fertile, being remarkable for producing the best Muscodine wine in the Levant; and its position, thus near the mouth of the Hellespont, has given it importance in all ages; vessels bound toward Constantinople finding shelter in its port, or safe anchorage in the road, during the Ætesian or contrary winds, and in foul weather. The emperor Justinian erected a magazine to receive the cargoes of the corn-ships from Alexandria, when detained there. This was a lofty building, two hundred and eighty feet long and ninety broad. The voyage from Egypt was rendered less precarious, and the grain preserved until it could be transported to the capital. Afterwards, during the troubles of the Greek empire, Tenedos experienced a variety of fortune. The pirates, who infested these seas, made it for many years their place of rendezvous; and Othman seized it in 1302, procured vessels, and thence subdued the other islands of the Archipelago. It has continued in the possession of the Turks ever since:

Teneriff. and on the eastern side is a pretty large town, seated at the foot of a mountain, with a fine harbour commanded by a castle. E. Long. 27. 0. N Lat. 29. 30.

TENERIFF, an island of Africa, and one of the Canaries, being the most considerable for riches, trade, and extent. It lies to the south of the island of Salvages, to the west of the Grand Canary, to the north of the island of Gomera, and to the east of that of Palma. It is of a triangular form, being about 45 miles in length and 20 in breadth; and in the centre is the famous peak, called by the natives *El Pico de Tejde*, which in clear weather may be seen at the distance of 120 miles, like a thin blue vapour very little darker than the sky.

The most frequented harbour is called *Santa Cruz*, which is on the south side of the island, and where ships with good anchors and cables may be safe in all weathers. At this port is the principal commercial town in the island, called also *Santa Cruz*, in the middle of which is a mole, built at a vast expence for the convenience of landing; between the mole and the town is a fort called *St Philips*, and near it is a steep rocky den or valley, beginning at the sea shore, and running far in land, which would render the attack of an enemy very difficult; there are also other forts for its defence, all joined together by a thick stone wall, and mounted with cannon.

*Clas's Hi-
storical Ac-
count of the
Canary
Islands.*

Santa Cruz is a large town, containing several churches and convents, an hospital, and the best constructed private buildings of any in the Canary islands. It contains about 7000 inhabitants; it is not fortified on the land side, and all the country near it is dry, stony, and barren.

About four leagues to the south of *Santa Cruz*, close to the sea, there is a cave, with a chapel called the *chapel of our Lady of Candelaria*, in which is an image of the Virgin Mary, that is held in as much reverence here as that of Diana was at Ephesus. This chapel is endowed with so many ornaments that it is the richest place in all the seven islands. At a certain season of the year almost all the inhabitants go thither on pilgrimage, and innumerable and incredible stories are related and universally believed concerning this image.

About four miles in land from *Santa Cruz* stands the city of *St Chrystobal de la Laguna*, which is the metropolis of the island, and contains two parish churches and five convents, but has no trade, being inhabited principally by the gentry of the island; the inhabitants are numerous, yet nobody is seen in the streets, which are solitary and desolate, so that grass grows in those that are most frequented. There are many other towns in the island which contain a great number of people, but none are more than three leagues from the sea.

All the fertile ground within a league of the sea is covered with vines; that of the next league is sown with corn, the third is adorned with woods, and above the woods are the clouds, for the island gradually ascends from the sea, rising on all sides till it terminates in the peak, which is the centre.

On the south-east of the island inland from *Candelaria* is a town called *Guimar*, where there are some families which know themselves to be the genuine unmixed offspring of the original natives; but they know nothing of the manners of their ancestors, nor have they preserved any remains of their language. They are fairer than the Spaniards of Andalusia.

Teneriff contains about 96,000 persons, supposed to be equal to the number of inhabitants of all the rest of the seven islands put together. The peasants in general are wretchedly clothed; when they do appear better, they are habited in the Spanish fashion. The men, in a genteeler line, dress

very gayly, and are seldom seen without long swords. It is remarked, that few of them walk with dignity and ease; which may be attributed to the long cloaks they usually wear. The women wear veils: those worn by the lower ranks are of black stuff, those of the higher of black silk; and such among the latter as have any claim to beauty are far from being over careful in concealing their faces by them. The young ladies wear their fine long black hair plaited, and fastened with a comb or a riband on the top of the head.

The common people, and in this they resemble the inhabitants of most of the islands in the Pacific Ocean lately discovered, have in them a strong tendency to thieving; they are besides lazy, and the most importunate beggars in the world. "I observed likewise (says Mr White) that the itch was so common among them, and had attained such a degree of violence, that one would almost be led to believe it was epidemic there. Some of the women are so abandoned and shameless, that it would be doing an injustice to the prostitutes met with in the streets of London to say they are like them. The females of every degree are said to be of an amorous constitution, and addicted to intrigue; for which no houses could be better adapted than those in Teneriff.

"The manufactures carried on here are very few, and the product of them little more than sufficient for their own consumption. They consist of taffeties, gauze, coarse linens, blankets, a little silk, and curious garters. The principal dependence of the inhabitants is on their wine (their staple commodity), oil, corn, and every kind of stock for shipping. With these the island abounds; and, in their season, produces not only the tropical fruits, but the vegetable productions of the European gardens, in the greatest plenty. Teneriff enjoys an agreeable and healthful mediocrity of climate. Indeed none seems better adapted for the restoration of a valetudinarian; as, by going into the mountains, he may graduate the air, and choose that state of it which best suits his complaint. But although the inhabitants are thus healthy, and have so little occasion for medical aid, they loudly complain of the want of knowledge in the professional gentlemen of the island."

The height of the peak of Teneriff has been so variously estimated and calculated by different travellers and geographers, that we can only take the mean between the two extremes of their decisions. Dr Halley allows but two miles and a quarter from the level of the sea to the summit of the sugar-loaf, whilst the Spanish account of the Canary islands, translated by Mr Glas in 1763, makes it no less than five miles; and others have assigned a height different from both these. That it is an extinguished volcano is universally known; and we are persuaded that the following account of the crater, and of some experiments made on its brink by M. Mongez on the 24th of August 1785, will prove not unacceptable to our chemical readers.

"The crater of the peak of Teneriff (says he) is a true sulphur-pit, similar to those of Italy. It is about 50 fathoms long and 40 broad, rising abruptly from east to west. At the edges of the crater, particularly on the under side, are many spiracles, or natural chimneys, from which there exhale aqueous vapours and sulphureous acids, which are so hot as to make the thermometer rise from 9° to 34° of Reaumur. The inside of the crater is covered with yellow, red, or white, argillaceous earth, and blocks of lava partly decomposed. Under these blocks are found superb crystals of sulphur; these are eight-sided rhomboidal crystals, sometimes an inch in length, and, I suppose, they are the finest crystals of volcanic sulphur that have ever been found. The water that exhales from the spiracles is perfectly pure, and not in the least acid, as I was convinced by several experiments.

"The

en:riff.

"The elevation of the peak above the level of the sea is near 1900 toises; which induced me to make several chemical experiments in order to compare the phenomena with those that occur in our laboratories. I shall here confine myself merely to the results.

"The volatilization and cooling of liquors were here very considerable. Half a minute was sufficient for the dissipation of a pretty strong dose of æther. The action of acids on metals, earths, and alkalis, was slow; and the bubbles which escaped during the effervescence were much larger than ordinary. The production of vitriols was attended with very singular phenomena. That of iron assumed all at once a very beautiful violet colour, and that of copper was suddenly precipitated of a very bright blue colour. I examined the moisture of the air by means of the hygrometer, of pure alkali, and of vitriolic acid; and I thence concluded, as well as from the direction of the aqueous vapours, that the air was very dry; for at the end of three hours the vitriolic acid had suffered hardly any change either in colour or weight; the fixed alkali remained dry, except near the edges of the vessel that contained it, where it was a little moist; and Saussure's hygrometer pointed to 64°, as nearly as the impetuous wind which then blew would permit us to judge.

"Liquors appeared to us to have lost nothing of their smell or strength at this height; a circumstance which contradicts all the tales that have hitherto been related on this head: volatile alkali, ether, spirit of wine, retained all their strength; the smoking spirit of Boyle was the only one that seemed to have lost any sensible portion of its energy. Its evaporation, however, was not the less quick; in 30 seconds, a quantity which I had poured into a cup was entirely volatilized; and nothing remained but the sulphur which tinged the rims and the bottom. When I poured the vitriolic acid on this liquor, there happened a violent detonation, and the vapours that arose had a very sensible degree of heat. I tried to form volatile alkali by decomposing sal ammoniac with the fixed alkali; but the production was slow and hardly sensible, while at the level of the sea this process, made with the same substances, in the same proportions, succeeded very readily and in abundance.

"As I was curious to investigate the nature of the vapours that exhale from the crater, and to know whether they contained inflammable air, fixed air, and marine acid, I made the following experiments: I exposed on the edge of one of the spiracles a nitrous solution of silver in a cup; it remained more than an hour in the midst of the vapours which were continually exhaling, but without any sensible alteration; which sufficiently shews that no vapours of marine acid exhale from the crater. I then poured into it some drops of marine acid, when a precipitation of luna cornea immediately ensued: but instead of being white, as that precipitate generally is, it was of a fine dark violet colour, which quickly became grey, and it assumed the form of small scaly crystals. These were very distinct when looked at with a glass, and they were even visible to the naked eye. I think myself justifiable in attributing this alteration of colour to the vapours of inflammable air, according to some experiments that I have made on the precipitation of luna cornea in such air. Lime-water, exposed for three hours on the margin of the crater, and in the neighbourhood of a spiracle, was not covered with any calcareous pellicle, nor even hardly with any filmy appearance: which proves, in my opinion, not only that no vapours of fixed air exhale from the crater, but that the atmospheric air, which rests upon it, contains very little of that air, and that the inflammable vapours and sulphureous acids alone are sensible and considerable. The electricity of the atmosphere was pretty considerable, for Saussure's electrometer, when held in the hand at the

height of about five feet, indicated three degrees, while on the ground it pointed only to one and a half. The electricity was positive." W. Long. 16. 18. N. Lat. 28. 29.

TENESMUS, in medicine, a name given by medical writers to a complaint which is a continual desire of going to stool, but without any stool being ready to be voided. This is properly no primary disease, but merely a symptomatic one, and differs in degree according to the disease on which it is an attendant. See MEDICINE, n° 111.

TENIERS (David), the Elder, a Flemish painter, born at Antwerp in 1582. He received the first rudiments of his art from the famous Rubens, who highly esteemed him for his promising genius, and with great satisfaction examined and commended his designs. From the school of that celebrated painter Teniers went to finish his studies at Rome. He attached himself to Adam Elsheimer for six years; and from the instructions of two such incomparable masters, he formed to himself a peculiar style, which his son cultivated so happily afterward as to bring it to the utmost perfection. His pictures were small; and his subjects usually shops, laboratories, humorous conversations, and rural festivities. The demand for his pieces was universal; and even his master Rubens thought them an ornament to his cabinet. He died at Antwerp in 1649.

TENIERS (David) the Younger, also an admirable painter, was the son of the former, and was born at Antwerp in 1610. He obtained the name of *Ape of Painting*, from his imitating the manner of different painters with such exactness as to deceive even the nicest judges. He improved greatly under his father, and obtained such reputation as introduced him to the favour of the great. The archduke Leopold William made him gentleman of his bed chamber; and all the pictures of his gallery were copied by Teniers, and engraved by his direction. The king of Spain and Don Juan of Austria set so high a value on his pictures, that they built a gallery on purpose for them. William prince of Orange honoured him with his friendship; and Rubens not only esteemed his works, but assisted him with his advice. His principal talent lay in landscapes adorned with small figures. He also painted men drinking and smoking, chemists laboratories, country fairs, and the like. His small figures are superior to his large ones. He died in 1694.

The works of the father and son are thus distinguished: The latter discover a finer touch and fresher pencil, greater variety of attitudes, and a better disposition of the figures. The father retained something of the tone of Italy in his colouring, which was stronger than the son's; besides, the son used to put at the bottom of his pictures, David Teniers, junior.

Abraham, another son of David the Elder, was equal, if not superior, to his father and brother in the expression of his characters, and his understanding the *claro obscuro*; though he was inferior in the sprightliness of his touch, and the lightness of his pencil.

TENISON (Dr Thomas), archbishop of Canterbury, was born at Cottenham in Cambridgeshire in 1636: and studied at Corpus Christi college in Cambridge. In his youth, while the fanatical government lasted, he applied himself to physick; but afterward went into orders, and was some time minister of St Andrew's church, Cambridge; where he attended the sick during the plague in 1665, which his parishioners acknowledged by the present of a piece of plate. He showed himself very active against the growth of Popery by his writings both in king Charles and king James's reigns: in 1680 he was presented to the vicarage of St Martin's in the Fields, London, to which parish he made several donations; and among others, endowed

Tenesmus
||
Tenison.

Tennis. a free school, and built a handsome library, which he furnished with useful books. King William and queen Mary, in 1689, presented him to the archdeaconry of London; in 1691, he was nominated to the see of Lincoln, and in 1694 he succeeded Dr Tillotson as archbishop of Canterbury. He performed all the duties of a good primate for 20 years, and died in 1715.

TENNIS, a play at which a ball is driven by a racket.

As many persons would become players at tennis, provided they could easily understand the rudiments of the game, so as to form some judgment of the players, or at least to know who wins and who loses, we have here attempted to give a plain description of it, that no one can be at a loss, if ever he should leit or play. As to the executive part, it requires great practice to make a good player, so that nothing can be done without it; all we presume to do is to give an insight into the game, whereby a person may not seem a total stranger to it when he happens to be in a tennis court.

How's
Game im-
proved by
Scotch.

The game of tennis is played in most capital cities in Europe, particularly in France, from whence we may venture to derive its origin. It is esteemed with many to be one of the most ancient games in Christendom, and long before king Charles I.'s time it was played in England.

This game is as intricate as any game whatever; a person who is totally ignorant of it may look on for a month together, without being able to make out how the game is decided. Therefore we shall begin by describing the court in which it is played.

The size of a tennis court is generally about 96 or 97 feet by 33 or 34, there being no exact dimension ascribed to its proportion, a foot more or less in length or width being of no consequence. A line or net hangs exactly across the middle, over which the ball must be struck, either with a racket or board to make the stroke good. Upon the entrance of a tennis court, there is a long gallery which goes to the dedans, that is, a kind of front gallery, where spectators usually stand, into which, whenever a ball is struck, it tells for a certain stroke. This long gallery is divided into different compartments or galleries, each of which has its particular name, as follows; from the line towards the dedans are the *first gallery, door, second gallery, and the last gallery*, which is called the *service side*. From the dedans to the last gallery are the figures 1, 2, 3, 4, 5, 6, at a yard distance each, by which the chaces are marked, and is one of the most essential parts of the game, as will appear in the following description.

On the other side of the line are also the *first gallery, door, second gallery, and last gallery*; which is called the *hazard-side*. Every ball struck into the last gallery on this side reckons for a certain stroke the same as the dedans. Between the second and this last gallery are the figures 1, 2, to mark the chaces on the hazard-side. Over this long gallery, or these compartments, is a covering, called the pent-house, on which they play the ball from the service-side, in order to begin a set of tennis, from which it is called a *service*. When they miss putting the ball (so as to rebound from the pent-house) over a certain line on the service-side, it is deemed a fault, two of which are reckoned for a stroke. If the ball rolls round the pent-house, on the opposite side of the court, so as to fall beyond a certain line described for that purpose, it is called *passé*, reckons for nothing on either side, and the player must serve again.

On the right-hand side of the court from the dedans is what they call the *tambour*, a part of the wall which projects, and is so contrived in order to make a variety in the stroke, and render it more difficult to be returned by the adversary; for when a ball strikes the *tambour*, it varies its direction, and requires some extraordinary judgment to re-

turn it over the line. The last thing on the right hand side is called the *grill*, wherein if the ball is struck, it is also 15, or a certain stroke.

The game of tennis is played by what they call *sets*; a set of tennis consists of six games: but if they play what is called an advantage set, two above five games must be won on one side or the other successively, in order to decide: or, if it comes to six games all, two games must still be won on one side to conclude the set; so that an advantage-set may last a considerable time; for which kind of sets the court is paid more than for any other.

We must now describe the use of the chaces, and by what means these chaces decide or interfere so much in the game. When the player gives his service at the beginning of a set, his adversary is supposed to return the ball; and wherever it falls after the first rebound untouched, the chace is called accordingly; for example, if the ball falls at the figure 1, the chace is called at a yard, that is to say, at a yard from the dedans: this chace remains till a second service is given; and if the player on the service side lets the ball go after his adversary returns it, and if the ball falls on or between any of these figures or chaces, they must change sides, there being two chaces; and he who then will be on the hazard side, must play to win the first chace; which if he wins by striking the ball so as to fall, after its first rebound, nearer to the dedans than the figure 1, without his adversary's being able to return it from its first hop, he wins a stroke, and then proceeds in like manner to win the second chace, wherever it should happen to be. If a ball falls on the line with the first gallery door, second gallery, or last gallery, the chace is likewise called at such or such a place, naming the gallery, door, &c. When it is just put over the line, it is called a chace at the line. If the player on the service-side returns a ball with such force as to strike the wall on the hazard-side so as to rebound, after the first hop over the line, it is also called a chace at the line.

The chaces on the hazard-side proceed from the ball being returned either too hard or not quite hard enough; so that the ball after its first rebound falls on this side of the blue line, or line which describes the hazard-side chaces; in which case it is a chace at 1, 2, &c. provided there is no chace depending. When they change sides, the player, in order to win this chace, must put the ball over the line anywhere, so that his adversary does not return it. When there is no chace on the hazard-side, all balls put over the line from the service side, without being returned, reckon for a stroke.

As the game depends chiefly upon the marking, it will be necessary to explain it, and to recommend those who play at tennis to have a good and unbiaſſed marker, for on him the whole set may depend: he can mark in favour of the one and against the other in such a manner, as will render it two to one at starting, though even players. Instead of which the marker should be very attentive to the chaces, and not be anyway partial to either of the players.

This game is marked in a very singular manner, which makes it at first somewhat difficult to understand. The first stroke is called 15, the second 30, the third 40, and the fourth game, unless the players get four strokes each; in that case, instead of calling it 40 all, it is called *deuce*; after which, as soon as any stroke is got, it is called *advantage*; and in case the strokes become equal again, *deuce* again, till one or the other gets two strokes following, which win the game; and as the games are won, so they are marked and called; as one game love, two games to one, &c. towards the set, of which so many of these games it consists.

Although but one ball at a time is played with, a number of balls are made use of at this game to avoid trouble, and are handed to the players in baskets for that purpose: by

ennis. which means they can play as long as they please, without ever having occasion to stoop for a ball.

As to the odds at tennis, they are by no means fixed, but are generally laid as follow :

Upon the first stroke being won between even players, that is, fifteen love, the odds are of the single

game

Thirty love	- - -	7	4
Forty love	- - -	8	1
Thirty fifteen	- - -	2	1
Forty fifteen	- - -	5	1
Forty thirty	- - -	3	1

The odds of a four game set when the

first game is won, are

When two games love	- - -	7	4
Three games love	- - -	8	1

When two games to one

Three games to one	- - -	2	1
Four games to one	- - -	5	1

The odds of a six game set when the

first game is won, are

When two games love	- - -	3	2
Three games love	- - -	2	1
Four games love	- - -	4	1
Five games love	- - -	10	1
Six games love	- - -	21	1

When two games to one

Three games to one	- - -	8	5
Four games to one	- - -	5	2
Five games to one	- - -	5	1
Six games to one	- - -	15	1

When three games to two

Four games to two	- - -	7	4
Five games to two	- - -	4	1
Six games to two	- - -	10	1

When four games to three

Five games to three	- - -	2	1
Six games to three	- - -	5	1

The odds of an advantage set when

the first game is won, are

When two games love	- - -	5	4
Three games love	- - -	7	4
Four games love	- - -	3	1
Five games love	- - -	5	1
Six games love	- - -	15	1

When two games to one

Three games to one	- - -	4	3
Four games to one	- - -	2	1
Five games to one	- - -	7	2
Six games to one	- - -	10	1

When three games to two

Four games to two	- - -	3	2
Five games to two	- - -	3	1
Six games to two	- - -	8	1

When four games to three

Five games to three	- - -	8	5
Six games to three	- - -	3	1
Seven games to three	- - -	3	1
Eight games to three	- - -	2	1
Nine games to three	- - -	2	1

When five games to four

Six games to four	- - -	5	2
-------------------	-------	---	---

The foregoing odds, as before said, are generally laid, but the chances interfering makes the odds very precarious; for example, when there is a chace at half a yard, and a set is five games all, and in every other respect equal, the odds are a good five to four; and if it were six games to five, and forty thirty with the same chace, the odds then would be a guinea to a shilling; so that it is plain that the odds at this game differ from those of any other: for one stroke will reduce a set, supposing the players to be five games all, from an even wager to three to two, and so on in proportion to the stage of the set.

There are various methods of giving odds at tennis, in order to make a match equal; and that they may be understood, we shall give the following list of them, with their meanings, so that any person may form a judgment of the advantage received or given.

The lowest odds that can be given, excepting the choice of the sides, is what they call a *bisque*, that is, a stroke to

be taken or scored whenever the player, who receives the advantage, thinks proper: for instance, suppose a critical game of the set to be forty thirty, by taking the *bisque*, he who is forty becomes game, and so in respect of two *bisques*, &c.

The next greater odds are *fifteen*, that is, a certain stroke given at the beginning of each game.

After these, *half thirty*, that is, fifteen one game, and thirty the next. Then follow the whole *thirty*, *forty*, &c.

There are also the following kind of odds which are given, viz.

Round services; these are services given round the penthouse, so as to render it easy for the *striker out* (the player who is on the hazard side) to return the ball.

Half court, that is, being obliged or confined to play into the adversary's half-court; sometimes it is played straight-wile, and at other times across; both which are great advantages given by him so confined, but the strait half-court is the greatest.

Touch-no-wall, that is, being obliged to play within the compass of the walls, or sides of the court. This is a considerable advantage to him who receives it; as all the balls must be played gently, and consequently they are much easier to take than those which are played hard, or according to the usual method of play.

Barring the hazards, that is, barring the dedans, tambour, grill, or the last gallery on the hazard-side, or any particular one or more of them.

These are the common kind of odds or advantages given; but there are many others, which are according to what is agreed by the players: such as playing with *board* against *racket*, *cricket-bat* against *racket*, &c.

The game of tennis is also played by four persons, two partners on each side. In this case, they are generally confined to their particular quarters, and one of each side appointed to serve and strike out; in every other respect, the game is played in the same manner as when two only play.

Any thing more to be said upon this subject would be needless, as nothing can be recommended, after reading this short account of tennis, but practice and attention, without which no one can become a proficient at the game.

TENOR, or TENOUR, the purport or content of a writing or instrument in law, &c.

TENOR, in music, the first mean, or middle part, or that which is the ordinary pitch of the voice, when neither raised to a treble nor lowered to a bass.

TENSE, in grammar, an inflection of verbs, whereby they are made to signify or distinguish the circumstance of time in what they affirm. See GRAMMAR.

TENT, in war, a pavilion or portable house. Tents are made of canvas, for officers and soldiers to lie under when in the field. The size of the officers tents is not fixed; some regiments have them of one size and some of another: a captain's tent and marquee is generally 10½ feet broad, 14 deep, and 8 high: the subalterns are a foot less; the major's and lieutenant colonel's a foot larger; and the colonel's two feet larger. The subalterns of foot lie two in a tent, and those of horse but one. The tents of private men are 6½ feet square, and 5 feet high, and hold five soldiers each. The tents for horse are 7 feet broad and 9 feet deep: they hold likewise five men and their horse accoutrements. — The word is formed from the Latin *tentorium*, of *teno* "I stretch," because tents are usually made of canvas stretched out, and sustained by poles, with cords and pegs.

TENT, in surgery, a roll of lint made into the shape of a nail with a broad flat head, chiefly used in deep wounds and ulcers. They are of service, not only in conveying medicines to the most intimate recesses and sinuses of the wound, but to prevent the lips of the wound from uniting before it

Tennis
||
Tent.

Tenter is healed from the bottom; and by their assistance grumous blood, sordes, &c. are readily evacuated.

TENTER. *Trierer*, or *Proser*, a machine used in the cloth manufactory, to stretch out the pieces of cloth, stuff, &c. or only to make them even and set them square.

It is usually about 24 feet high, and for length exceeds that of the longest piece of cloth. It consists of several long square pieces of wood, placed like those which form the barriers of a manège: so, however, as that the lower cross pieces of wood may be raised or lowered as is found requisite, to be fixed at any height by means of pins. Along the cross pieces, both the upper and under one, are hooked nails, called *tenter-hooks*, driven in from space to space.

To put a piece of Cloth on the TENTER. While the piece is yet quite wet, one end is fastened to one of the ends of the tenter; then it is pulled by force of arms towards the other end, to bring it to the length required: that other end being fastened, the upper list is hooked on to the upper cross piece, and the lowest list to the lowest cross-piece, which is afterwards lowered by force, till the piece have its desired breadth. Being thus well stretched, both as to length and breadth, they brush it with a stiff hair brush, and thus let it dry. Then they take it off; and, till they wet it again, it will retain the length and breadth the tenter gave it.

TENTHREDO, the *SAW-FLY*; a genus of insects belonging to the order of *hymenoptera*. The mouth is furnished with jaws, which are horny, arched, dentated within; the right jaw being obtuse at the apex: the lip cylindrical, trisid: there are four feelers, unequal and filiform: the wings are plain and turned: the sting consists of two serrated laminae, and the scutellum of two grains placed at a distance. Gmelin mentions 143 species. These insects are not very stay. Some, by means of their saw, deposit in the buds of flowers, others on the twigs of trees or shrubs, eggs from which are produced caterpillars. The implement with which they are armed is nowise formidable; as it appears only destined to the purpose of depositing their eggs.

TENTHS, and *FIRST FRUITS of Spiritual Preferments*, a branch of the king's revenue. See **REVENUE**.

These were originally a part of the Papal usurpations over the clergy of this kingdom; first introduced by Pandolph the pope's legate, during the reigns of king John and Henry III. in the see of Norwich; and afterwards attempted to be made universal by the popes Clement V. and John XXII. about the beginning of the 14th century. The first fruits, *primities* or *annates*, were the full year's whole profits of the spiritual preferment, according to a rate or *valor* made under the direction of pope Innocent IV. by Walter bishop of Norwich in 38 Hen. III. and afterwards advanced in value by commission from pope Nicholas III. A. D. 1292, 20 Edw. I.; which valuation of pope Nicholas is still preserved in the exchequer. The tenths, or *decimæ*, were the tenth part of the annual profit of each living by the same valuation; which was also claimed by the holy see, under no better pretence than a strange misapplication of that precept of the Levitical law, which directs, that the Levites "should offer the tenth part of their tithes as a heave-offering to the Lord, and give it to Aaron the high-priest. But this claim of the pope met with vigorous resistance from the English parliament; and a variety of acts were passed to prevent and restrain it, particularly the statute 6 Hen. IV. c. 1. which calls it a *horrible mischief and damnable custom*. But the Popish clergy, blindly devoted to the will of a foreign master, still kept it on foot; sometimes more secretly, sometimes more openly and avowedly: so that in the reign of Henry VIII. it was computed, that

in the compass of 50 years 800,000 ducats had been sent to Rome for first fruits only. And as the clergy expressed this willingness to contribute so much of their income to the head of the church, it was thought proper (when in the same reign the papal power was abolished, and the king was declared the head of the church of England) to annex this revenue to the crown; which was done by statute 26 Hen. VIII. c. 3. (confirmed by statute 1 Eliz. c. 4.); and a new *valor beneficiorum* was then made, by which the clergy are at present rated.

By these last mentioned statutes all vicarages under ten pounds a year, and all rectories under ten marks, are discharged from the payment of first fruits: and if, in such livings as continue chargeable with this payment, the incumbent lives but half a year, he shall pay only one quarter of his first fruits; if but one whole year, then half of them; if a year and a half, three quarters; and if two years, then the whole, and not otherwise. Likewise by the statute 27 Hen. VIII. c. 8. no tenths are to be paid for the first year, for then the first fruits are due: and by other statutes of queen Anne, in the fifth and sixth years of her reign, if a benefice be under £ 50 *per annum* clear yearly value, it shall be discharged of the payment of first-fruits and tenths.

Thus the richer clergy being, by the criminal bigotry of their Popish predecessors, subjected at first to a foreign exaction, were afterwards, when that yoke was shaken off, liable to a like misapplication of their revenues through the rapacious disposition of the then reigning monarch: till at length the piety of queen Anne restored to the church what had been thus indirectly taken from it. This she did, not by remitting the tenths and first fruits entirely; but, in a spirit of the truest equity, by applying these superfluities of the larger benefices to make up the deficiencies of the smaller. And to this end she granted her royal charter, which was confirmed by the statute 2 Ann. c. 11. whereby all the revenue of first fruits and tenths is vested in trustees for ever, to form a perpetual fund for the augmentation of poor livings. This is usually called *Queen Anne's bounty*; which has been still farther regulated by subsequent statutes.

TENURE, in law, signifies the manner whereby lands or tenements are held, or the service that the tenant owes to his lord.

Of this kingdom almost all the real property is by the policy of our laws supposed to be granted by, dependent upon, and holden of, some superior lord, by and in consideration of certain services to be rendered to the lord by the tenant or possessor of this property. The thing holden is therefore styled a *tenement*, the possessors thereof *tenants*, and the manner of their possession a *tenure*. Thus all the lands in the kingdom is supposed to be holden, mediately or immediately, of the king; who is styled the *lord paramount*, or above all. Such tenants as held under the king immediately, when they granted out portions of the lands to inferior persons, became also lords with respect to those inferior persons, as they were still tenants with respect to the king; and, thus partaking of a middle nature, were called *mesne* or *middle lords*. So that if the king granted a manor to A, and he granted a portion of the land to B, now B was said to hold of A, and A of the king; or, in other words, B held his lands immediately of A, but mediately of the king. The king therefore was styled *lord paramount*: A was both tenant and lord, or was a *mesne lord*; and B was called *tenant paravail*, or the *lowest tenant*, being he who was supposed to make avail, or profit of the land. In this manner are all the lands of the kingdom holden which are in the hands of subjects: for, according to Sir Edward Coke, in the law of England we have not properly *allodum*, which is the name by which the feudists abroad distinguish such

such estates of the subject as are not holden of any superior. So that at the first glance we may observe, that our lands are either plainly feuds, or partake very strongly of the feudal nature.

All tenures being thus derived, or supposed to be derived, from the king, those that held immediately under him, in right of his crown and dignity, were called his *tenants in capite*, or *in chief*; which was the most honourable species of tenure, but at the same time subjected the tenants to greater and more burdensome services than inferior tenures did. And this distinction ran through all the different sorts of tenure.

There seem to have subsisted among our ancestors four principal species of lay-tenures, to which all other may be reduced: the grand criteria of which were the natures of the several services or renders that were due to the lords from their tenants. The services, in respect of their quality, were either *free* or *base* services: in respect of their quantity and the time of exacting them were either *certain* or *uncertain*. Free services were such as were not unbecoming the character of a soldier or a freeman to perform; as to serve under his lord in the wars, to pay a sum of money, and the like. Base services were such as were fit only for peasants or persons of a servile rank; as to plough the lord's land, to make his hedges, to carry out his dung, or other mean employments. The certain services, whether free or base, were such as were stinted in quantity, and could not be exceeded on any pretence; as, to pay a stated annual-rent, or to plough such a field for three days. The uncertain depended upon unknown contingencies; as, to do military service in person, or pay an assessment in lieu of it when called upon; or to wind a horn upon the appearance of invaders; which are free services; or to do whatever the lord should command; which is a base or villein service.

From the various combinations of these services have arisen the four kinds of lay-tenure which subsisted in England till the middle of the last century; and three of which subsist to this day. Of these Bracton (who wrote under Henry the Third) seems to give the clearest and most compendious account of any author ancient or modern; of which the following is the outline or abstract: "Tenements are of two kinds, *frank-tenement*, and *villanage*. And of frank-tenements, some are held freely in consideration of homage and knight-service; others in free-tenage, with the service of fealty only. And again, of villanages, some are *pure*, and others *privileged*. He that holds in pure villanage shall do whatsoever is commanded him, and always be bound to an uncertain service. The other kind of villanage is called *villein-tenage*; and these villein-tenants do villein-services, but such as are certain and determined." Of which the sense seems to be as follows; first, where the service was free, but uncertain, as military service with homage, that tenure was called the *tenure in chivalry*, *per servitium militare*, or by knight service. Secondly, where the service was not only free, but also certain, as by fealty only, by rent and fealty, &c. that tenure was called *literum socagium*, or *free socage*. These were the only free holdings or tenements; the others were villenous or servile: as, thirdly, where the service was base in its nature; and uncertain as to time and quantity, the tenure was *purum villanagium*, absolute or pure villanage. Lastly, where the service was base in its nature, but reduced to a certainty, this was still villanage, but distinguished from the other by the name of *privileged villanage*, *villanagium privilegiatum*; or it might be still called *socage* (from the certainty of its services), but degraded by their baseness into the inferior title of *villanum socagium*, villein-tenage.

1. The military tenure, or that by knight-service, was

done away by stat. 12 Car. II. For an account of this species of tenure see *FEDAL System*, and *KNIGHT-Service*; and for its incidents, see *RELIEF*, *PRIMER-SEISM*, *WARD-SHIP*, *MARRIAGE*, *FINES*, and *ESCHEAT*.

2. The second species of tenure or free-tenage, not only subsists to this day, but has in a manner absorbed and swallowed up (since the statute of Charles the Second) almost every other species of tenure. See *SOCAGE*.

The other grand division of tenure, mentioned by Bracton, is that of villenage, as contradicting distinguished from *literum tenementum*, or frank-tenure. And this (we may remember) he subdivides into two classes, pure and privileged villenage: from whence have arisen two other species of our modern tenures.

3. From the tenure of pure villenage have sprung our present copyhold-tenures, or tenure by copy of court-roll at the will of the lord; in order to obtain a clear idea of which, it will be previously necessary to consult the articles *MANOR* and *VILLENAGE*.

As a farther consequence of what has been there explained, we may collect these two main principles, which are held to be the supporters of a copyhold-tenure, and without which it cannot exist; 1. That the lands be parcel of and situate within that manor under which it is held. 2. That they have been demised, or demisable, by copy of court-roll immemorially. For immemorial custom is the life of all tenures by copy; so that no new copyhold can, strictly speaking, be granted at this day.

In some manors, where the custom hath been to permit the heir to succeed the ancestor in his tenure, the estates are styled *copyholds of inheritance*; in others, where the lords have been more vigilant to maintain their rights, they remain copyholds for life only; for the custom of the manor has in both cases so far superseded the will of the lord, that, provided the services be performed or stipulated for by fealty, he cannot in the first instance refuse to admit the heir of his tenant upon his death; nor, in the second, can he remove his present tenant so long as he lives, though he holds nominally by the precarious tenure of his lord's will.

The fruits and appendages of a copyhold-tenure, that it hath in common with free tenures, are fealty, services (as well in rents as otherwise), reliefs, and escheats. The two latter belong only to copyholds of inheritance; the former to those for life also. But, besides these, copyholds have also heriots, wardship, and fines. Heriots, which are agreed to be a Danish custom, are a render of the best beast or other good (as the custom may be) to the lord on the death of the tenant. This is plainly a relic of villein tenure; there being originally less hardship in it, when all the goods and chattels belonged to the lord, and he might have seized them even in the villein's lifetime. These are incident to both species of copyhold; but wardship and fines to those of inheritance only. Wardship, in copyhold estates, partakes both of that in chivalry and that in socage. Like that in chivalry, the lord is the legal guardian, who usually assigns some relation of the infant tenant to act in his stead: and he, like guardian in socage, is accountable to his ward for the profits. Of fines, some are in the nature of primer-seisms, due on the death of each tenant, others are mere fines for alienations of the lauds; in some manors, only one or those sorts can be demanded, in some both, and in others neither. They are sometimes arbitrary and at the will of the lord, sometimes fixed by custom; but, even when arbitrary, the courts of law, in favour of the liberty of copyholders, have tied them down to be reasonable in their extent; otherwise they might amount to disinheritance of the estate. No fine therefore is allowed to be taken upon descents and alienations (unless in particular circumstances) of

more than two years improved value of the estate. From this instance we may judge of the favourable disposition that the law of England (which is a law of liberty) hath always shown to this species of tenants, by removing, as far as possible, every real badge of slavery from them, however some nominal ones may continue. It suffered custom very early to get the better of the express terms upon which they held their lands; by declaring, that the will of the lord was to be interpreted by the custom of the manor; and, where no custom has been suffered to grow up to the prejudice of the lord, as in this case of arbitrary fine, the law itself interposes in an equitable method, and will not suffer the lord to extend his power so far as to disinherit the tenant.

4. There is yet a fourth species of tenure, described by Bracton, under the name sometimes of *privileged villenage*, and sometimes of *villain-foage*. See *Privileged VILLENAGE*.

Having in the present article and those referred to, taken a compendious view of the principal and fundamental points of the doctrine of tenures, both ancient and modern, we cannot but remark the mutual connection and dependence that all of them have upon each other. And upon the whole it appears, that, whatever changes and alterations these tenures have in process of time undergone, from the Saxon era to the 12 Car. II. all lay-tenures are now in effect reduced to two species; free tenure in common soage, and base tenure by copy of court roll. But there is still behind one other species of tenure, reserved by the statute of Charles II. which is of a spiritual nature, and called the tenure in *FRANK-ALMOIGN*; see that article.

A particular account of the ancient tenures would to many persons be highly amusing. We can only select a few of the most singular, referring the curious reader for more information to Anderfon's Origin of Commerce, Henry's History of Britain, and Blount's *Fragmenta Antiquitates*.

In the 19th of Henry III. Walter Gately held the manor of Westcourt, in Bedington in Surry, yielding yearly to the king one cross-bow, *balistam*, value twelve pence.

Anno tertio Edw. I. Osbert de Lonchamp, knight, held his lands of Ovenhelle in Kent, for personally guarding the king forty days into Wales at his own expence, with one horse of five shillings value, one sack worth sixpence, and one broch for that sack. *N. B.* All personal services, or attendances on our kings in those times, were limited to forty days, at their own expence.

The like the same year of Laurence de Broke, who for his hamlet of Renham in Middlesex, found the king one soldier, a horse worth five shillings, a sack worth fivepence, and a broch worth twopence (this broch was a kind of eup, jur, pot, or basin), for forty days, at his own expence, wherever his army shall be within the four seas. This was settled (says Mr Blount) at the Stone Cross, which stood near the May pole in the Strand, London, where the judges- itinerant used in old times to sit.

Robert Maunsel's tenure of lands in Peverel paid the same service, and the horse, sack, and broch, of the same prices.

13mo Edw. I. Henry de Averning's tenure of the manor of Morten in Essex, was to find a man, a horse worth ten shillings, four horse-shoes, a leather sack, and an iron broch.

The year following, three persons held thirty acres of land in Carleton in Norfolk, by the service of bringing the king, whenever he shall be in England, twenty-four palkies of fresh herrings, at their first coming in.

Another held his manor in Norfolk of that king, by annually supplying him at his exchequer with two vessels, call-

ed *mues*, of wine made of pearmain. "Here (says our author) it is worth observing, that in King Edward the First's time pearmain cyder was called *vine*." This therefore seems to account for the mention of vineyards in old times in Kent, Suffex, and other parts of England, which has so often puzzled many people to elucidate.

Another person, in the 21st of the said king, held thirty acres of land, valued at ten shillings yearly in the exchequer, or fourpence *per acre*, in Cambridgeshire, for furnishing a truss of hay for the king's necessary-house or privy, whenever he shall come into that county.

Another, in the 34th of that king, held a manor in Kent, for providing a man to lead three greyhounds when the king shall go into Gaseony, so long as a pair of shoes of fourpence should last.

And that we may not again recur to these old tenures, we shall further add, from the same author, that in the first year of king Edward II. Peter Spileman made fine to the king for his lands by serjeanty, to find one to serve as a soldier for forty days in England, with a coat of mail; also to find straw for the king's bed, and hay for his horse.

This article of straw for the king's bed we did not so much wonder at, when we found it in an article in William the Conqueror's time; but it is somewhat more remarkable so late as the days of king Edward the Second.

Several others, we find, held their lands of the crown in those times by very different tenures. One, by paying two white capons annually; another, by carrying the king's standard whenever he happens to be in the county of Suffex; another, by carrying a rod or baton before the king on certain occasions; another, by serving the office of chamberlain of the exchequer, a very good place at present; another, by building and upholding a bridge; another, by being *marechal (meretricum)*, i. e. as Mr Blount translates it, of the laundresses in the king's army; another, by acting as a serjeant at arms for the king's army whilst in England; one supplies a servant for the king's larder; another, for his wardrobe; others, to find servants for this or that forest; another, a hawk; one presents the king a pair of scarlet hose annually; others are bound to supply soldiers with armour for certain days, for the keeping this or that castle; one, viz. for the manor of Elton in Nottinghamshire, pays yearly rent of one pound weight of cummin seed, two pair of gloves, and a steel needle; another, is to repair the iron-work of the king's ploughs; Ela Countess of Warwick, in the 13th year of king Edward I. held the manor of Hokerorton in Oxfordshire, in the barony of D'Oyly, by the serjeanty of carving at the king's table on his birth-day, and she to have the knife the king then uses at table.

TEOS, one of the twelve Ionian cities, was situated on the south side of the Ionian peninsula, and distinguished by being the place where the poet Anacreon and the historian Hecataeus were born.

TERAPHIM, or THERAPHIM, a word in the Hebrew language, which has exercised much the ingenuity of the critics. It occurs 13 or 14 times in the Old Testament, and is commonly interpreted *idols*. We will not trouble our readers with the numerous conjectures which have been formed respecting the meaning of this word. The only way to determine it, if it be at all possible, would be to examine and compare all the passages in which it occurs, and to consult the ancient translations. Conjectures are useless; every man may make a new one, which will have just as good a title to belief as those which have been already proposed.

TERCERY, one of the largest islands of the Azores, or Western Islands, lying in the Atlantic Ocean. It is about 40 miles in circumference; and surrounded with craggy rocks, which render it almost inaccessible. The soil is fertile,

Tene
ll
Tercy.

terebella fertile, abounding in corn, wine, and fruits; and they have such plenty of cattle, that they supply the ships therewith that call there. However, their principal trade is wood. The inhabitants are lively and well made; and they pretend to a great deal of religion and gallantry at the same time. They pique themselves upon points of honour, and are extremely revengeful. It is their custom to rove about in the night-time in quest of intrigues, and seldom fail in finding women for their purpose. It is subject to Portugal; and Angra is the capital town. W. Long. 27. 1. N. Lat. 28. 45.

TEREBELLA, the **PIERCER**, in natural history, a genus of insects belonging to the class of *vermes*, and order of *mollusca*. The body is filiform, the mouth placed before; the preputium puts forth a pedunculated tubulous gland. There are several capillary tentacula about the mouth. There are ten species.

TEREBINTHINE Elebuary. See **PHARMACY**, n^o 599.

TEREBINTHUS, in botany. See **PISTACIA**.

TEREDO, in natural history, a genus of *vermes* belonging to the order of *testacea*. The animal is a terebella; there are two valves, calcareous, hemispherical, and cut off before, and two lanceolated. The shell is tapering, bending, and capable of penetrating wood. There are only three species; the *navalis*, *utriculus*, and *clava*.

The *navalis*, or ship-worm, which has a very slender smooth cylindrical shell, inhabits the Indian seas, whence it was imported into Europe. It penetrates easily into the stoutest oak-planks, and produces dreadful destruction to the ships by the holes it makes in their sides; and it is to avoid the effects of this insect that vessels require sheathing.

The head of this creature is well prepared by nature for the hard offices which it has to undergo, being coated with a strong armour, and furnished with a mouth like that of the leech; by which it pierces wood, as that animal does the skin; a little above this it has two horns which seem a kind of continuation of the shell; the neck is as strongly provided for the service of the creature as the head, being furnished with several strong muscles; the rest of the body is only covered by a very thin and transparent skin, through which the motion of the intestines is plainly seen by the naked eye; and by means of the microscope several other very remarkable particulars become visible there. This creature is wonderfully minute when newly excluded from the egg, but it grows to the length of four or six inches, and sometimes more.

When the bottom of a vessel, or any piece of wood which is constantly under water, is inhabited by these worms, it is full of small holes; but no damage appears till the outer parts are cut away: Then their shelly habitations come into view; in which there is a large space for inclosing the animal, and surrounding it with water. There is an evident care in these creatures never to injure one another's habitations; by this means each case or shell is preserved entire; and in such pieces of wood as have been found eaten by them into a sort of honeycomb, there never is seen a passage or communication between any two of the shells, tho' the woody matter between them often is not thicker than a piece of writing-paper.

They penetrate some kinds of wood much more easily than others. They make their way most quickly into fir and al-

der, and grow to the greatest size. In the oak they make small progress, and appear small and feeble, and their shells much discoloured.

Since each of these animals is lodged in a solitary cell, and has no access to those of its own species, it has been matter of surprise how they should increase to so vast a multitude. Upon dissecting them, it appears that every individual has the parts of both sexes, and is therefore supposed to propagate by itself.

The sea-worms, which are pernicious to our shipping, appear to have the same office allotted them in the waters which the termites have on the land (see **TERMES**). They will appear, on a very little consideration, to be most important beings in the great chain of creation, and pleasing demonstrations of that infinitely wise and gracious Power which formed, and still preserves, the whole in such wonderful order and beauty: for if it was not for the rapacity of these and such animals, tropical rivers, and indeed the ocean itself, would be choked with the bodies of trees which are annually carried down by the rapid torrents, as many of them would last for ages, and probably be productive of evils, of which, happily, we cannot in the present harmonious state of things form any idea (A); whereas now being consumed by these animals, they are more easily broken in pieces by the waves; and the fragments which are not devoured become specifically lighter, and are consequently more readily and more effectually thrown on shore, where the sun, wind, insects, and various other instruments, speedily promote their entire dissolution.

TERENCE, or **PUBLIUS TERENCE**, a celebrated comic poet of ancient Rome, was born at Carthage in Africa. He was slave to Terentius Lucanus the senator; who gave him his liberty on account of his wit, his good mien, and great abilities. Terence, on his becoming a freed man, applied himself to the writing of comedies; in the execution of which he imitated Menander and the other celebrated comic poets of Greece. Cicero gives him the most pompous eulogiums, both for the purity of his language and the perspicuity and beauty of his compositions, which he considers as the rule and standard of the Latin tongue; and observes, that they were esteemed so fine and elegant, that they were thought to have been written by Scipio and Lælius, who were then the greatest personages and the most eloquent of the Roman people. Terence died while on a voyage into Greece, about the 15th year before the Christian era. There are six of his comedies extant, of which the best editions are the Elzevir one 1635, 12mo; that *cum integris notis Donati, et selectis variorum*, 1686, 8vo; Westenhovius's, in two vols 4to 1726; and that of Bentley the same year 4to. Madam Dacier has given a beautiful French version of this author; and a very good English translation was published in 4to, 1768, by Mr Colman.

TERM, in law, is generally taken for a limitation of time or estate; as, a lease for term of life or years.

Term, however, is more particularly used for that time wherein our courts of justice are open; in opposition to which, the rest of the year is called *vacation*.

TERM, in grammar, denotes some word or expression in a language.

The word *term*, *terminus*, is borrowed metaphorically, by the grammarians and philosophers, from the measurers or sur-

Terence,
Term.

Pbil.
Tr. inf. for
1751.

(A) That wood will endure in water for many centuries, is apparent from the oak stakes which were driven into the bed of the river Thames on the invasion of this island by Julius Cæsar, one of which is to be seen in Sir Ashton Lever's museum, and likewise from those bodies of trees which are daily found in the bogs and morasses of Great Britain and Ireland, which after a duration, the former of eighteen hundred, the latter of upwards of two thousand years, are found in a perfect state of preservation.

Terms. *vey* ors of lands: as a field is defined and distinguished by its *termini*, or limits, so is a thing or matter spoken of by the word or term it is denoted by.

TERM in the Arts, or **TERM** of Art, is a word which, besides the literal and popular meaning which it has or may have in common language, bears a further and peculiar meaning in some art or science.

TERMS, the several times or seasons of the year, wherein the tribunals, or courts of judicature, are open to all who think fit to complain of wrong, or to seek their rights by due course of law, or action; and during which the courts in Westminster-hall sit and give judgment. But the high court of parliament, the chancery, and inferior courts, do not observe the terms; only the courts of king's-bench, common-pleas, and exchequer, which are the highest courts at common law. In contradistinction to these, the rest of the year is called *vacation*.

Of these terms there are four in every year, during which time matters of justice are dispatched. *Hilary-term*, which, at London, begins the 23d day of January, or if that be Sunday, the next day after; and ends the 12th of February following. *Easter-term*, which begins the Wednesday fortnight after Easter-day, and ends the Monday next after Ascension-day. *Trinity-term*, beginning the Friday next after Trinity-Sunday, and ending the Wednesday fortnight after. *Michaelmas-term*, which begins the sixth day of November, and ends the 28th of November following. Each of these terms have also their returns. These terms are supposed by Mr Selden to have been instituted by William the Conqueror; but Sir H. Spelman hath shewn, that they were gradually formed from the canonical constitutions of the church; being no other than those leisure seasons of the year which were not occupied by the great festivals or fasts, or which were not liable to the general avocations of rural business. Throughout all Christendom, in very early times, the whole year was one continual term for hearing and deciding causes. For the Christian magistrates, in order to distinguish themselves from the heathens, who were very superstitious in the observation of their *dies fasti* and *nefasti*, administered justice upon all days alike; till at length the church interposed, and exempted certain holy seasons from being profaned by the tumult of forensic litigations; as, particularly, the time of Advent and Christmas, which gave rise to the winter vacation; the time of Lent and Easter, which created that in the spring; the time of Pentecost, which produced the third; and the long vacation, between midsummer and Michaelmas, which was allowed for the hay-time and harvest. All Sundays also, and some peculiar festivals, as the days of the purification, ascension, &c. were included in the same prohibition, which was established by a canon of the church, A. D. 517, and fortified by an imperial constitution of the younger Theodosius, comprized in the Theodosian code. Afterwards, when our own legal constitution was established, the commencement and duration of our law terms were appointed, with a view to these canonical prohibitions; and it was ordered by the laws of king Edward the Confessor, that from Advent to the octave of the Epiphany, from Septuagesima to the octave of Easter, from the Ascension to the octave of Pentecost, and from three in the afternoon of all Saturdays till Monday morning, the peace of God and holy church shall be kept throughout the whole kingdom.

And so extravagant was afterwards the regard paid to these holy times, that though the author of the Mirror mentions only one vacation of considerable length, containing the months of August and September, yet Britton says, that in the reign of king Edward I. no secular plea could be held, nor any man sworn on the Evangelists, in the time of

Advent, Lent, Pentecost, harvest, and vintage, the days of the great litanies, and all solemn festivals. He adds, that the bishops and prelates granted dispensations for taking assizes and juries in some of these holy seasons, upon reasonable occasions; and soon after a general dispensation was established in parliament by stat. Westm. 1. 3 Edw. I. cap. 51. that assizes of novel disseisin, *mort d'ancestor*, and *darrein presentment*, should be taken in Advent, Septuagesima, and Lent, as well as inquests; at the special request of the king to the bishops. The portions of time that were not included within these prohibited seasons fell naturally into a fourfold division; and from some festival, or saint's day, that immediately preceded their commencement, were denominated the terms of *St Hilary*, of *Easter*, of the *Holy Trinity*, and of *St Michael*: which terms have been since regulated and abbreviated by several acts of parliament; particularly Trinity-term by stat. 32 Hen. VIII. cap. 2. and Michaelmas-term by stat. 16 Car. I. cap. 6. and again by stat. 24 Geo. II. cap. 48.

TERMS, Oxford. Hilary or Lent-term begins January 14th, and ends the Saturday before Palm-Sunday. Easter-term begins the tenth day after Easter, and ends the Thursday before Whitunday. Trinity-term begins the Wednesday after Trinity-Sunday, and ends after the act, or 6th of July, sooner or later, as the vice-chancellor and convocation please. Michaelmas-term begins October the 10th, and ends December the 17th.

TERMS, Cambridge. Lent-term begins January the 14th, and ends Friday before Palm-Sunday. Easter-term begins the Wednesday after Easter-week, and ends the week before Whitunday. Trinity-term begins the Wednesday after Trinity-Sunday, and ends the Friday after the commencement, or 2d of July. Michaelmas-term begins October the 10th, and ends December the 16th.

TERMS, Scottish. The court of session has two terms, the winter and summer. The winter begins on 12th November, and ends 11th March, only there is a recess of three weeks at Christmas. The summer term commences 12th May, and ends 11th July. The court of exchequer has four terms: 1. Candlemas term begins 15th January, and ends 3d February; 2. Whitsuntide term begins 12th May, and ends 2d June; 3. Lammas term begins 17th June, and ends 5th July; 4. Martinmas term begins 24th November, and ends 20th December.

TERMS, Irish. In Ireland the terms are the same as at London, except Michaelmas-term, which begins October the 13th, and adjourns to November the 3d, and thence to the 6th.

TERMES, in entomology; a genus of insects belonging to the order of *aptera*, according to Linnæus, but by others it is arranged more properly under the *neuroptera*. The mouth has two horny jaws; the lip is horny and quadrifid, the lacinizæ being linear and acute; there are four feelers, which are equal and filiform. The antennæ are moniliform in most species, and the eyes two. There are eight species, according to Gmelin; the *fatale*, *destructor*, *ardis*, *mordax*, *capense*, *fatidicum*, *pulsatorium*, and *divinatorium*. But as Gmelin has followed the classification of Linnæus in arranging the termes under the order of *aptera*, it is not improbable that several of these which are mentioned as species of the termes may belong to a different genus. It will be sufficient, in the present article, to describe the *fatale*, which we are enabled to do from very accurate information.

The *termes fatale*, *bellicosus*, or white ant, is of a yellow colour above; the wings also yellowish; the costa is ferruginous; the stemmata are near the eyes, the central point being somewhat prominent. Of the white ant we have a very curious and interesting description, in the Philo-

Terms. *Terms.* Philosophical Transactions for 1781, by Mr Henry Smeathman of Clement's Inn. According to this account, the works of these insects surpass those of the bees, wasps, beavers, and other animals, as much at least as those of the most polished European nations excel those of the least cultivated savages. And even with regard to man, his greatest works, the boated pyramids, fall comparatively far short, even in size alone, of the structures raised by these insects. The labourers among them employed in this service are not a quarter of an inch in length; but the structures which they erect rise to 10 or 12 feet and upwards above the surface of the earth. Supposing the height of a man to be six feet, the author calculates, that the buildings of these insects may be considered, relatively to their size and that of a man, as being raised to near five times the height of the greatest of the Egyptian pyramids; that is, corresponding with considerably more than half a mile. We may add, that, with respect to the interior construction, and the various members and dispositions of the parts of the building, they appear greatly to exceed that or any other work of human construction.

The most striking parts of these structures are, the royal apartments, the nurseries, magazines of provisions, arched chambers and galleries, with their various communications; the ranges of Gothic-shaped arches, projected, and not formed by mere excavation, some of which are two or three feet high, but which diminish rapidly, like the arches of aisles in perspectives; the various roads, sloping staircases, and bridges, consisting of one vast arch, and constructed to shorten the distance between the several parts of the building, which would otherwise communicate only by winding passages. In some parts near Senegal, their number, magnitude, and closeness of situation, make them appear like the villages of the natives. But these and many other curious instances of the great sagacity and powers of these insects cannot be understood, without viewing the plates in which their feeble frames, and comparatively stupendous works, are delineated. See Phil. Trans. above referred to.

The economy of these industrious insects appears to have been very attentively observed by the ingenious author, as well as their buildings. There are three distinct ranks or orders among them, constituting a well-regulated community. These are, first, the *labourers*, or working insects; next the *soldiers*, or fighting order, who do no kind of labour, and are about twice as long as the former, and equal in bulk to about 15 of them; and lastly, the winged or perfect insects, which may be called the *nobility* or *gentry* of the state; for they neither labour nor fight, being scarcely capable even of self-defence. "These only are capable of being elected *kings* or *queens*; and nature has so ordered it, that they emigrate within a few weeks after they are elevated to this state, and either establish new kingdoms, or perish within a day or two."

The first order, the working insects, are most numerous, being in the proportion of 100 to 1 of the soldiers. In this state they are about $\frac{1}{4}$ of an inch long, and 25 of them weigh about a grain, so that they are not so large as some of our ants. See Plate DI. fig. 1. and 2.

The second order, or soldiers, have a very different form from the labourers, and have been by some authors supposed to be the males, and the former neuters; but they are, in fact, the same insects as the foregoing, only they have undergone a change of form, and approached one degree nearer to the perfect state. They are now much larger, being half an inch long, and equal in bulk to fifteen of the labourers, (fig. 3. and 4.)

The third order, or the insect in its perfect state, varies its form still more than ever. The head, thorax, and ab-

domen, differ almost entirely from the same parts in the labourers and soldiers; and, besides this, the animal is now furnished with four fine large brownish, transparent, wings, with which it is at the time of emigration to wing its way in search of a new settlement. It differs so much from the other two, that they have not hitherto been supposed to belong to the same community. In fact, they are not to be discovered in the nest till just before the commencement of the rainy season; when they undergo the last change, which is preparative to the formation of new colonies. They are equal in bulk to two soldiers and about 30 labourers (see fig. 5.), and by means of the wings with which they are furnished they roam about for a few hours; at the end of which time they lose their wings, and become the prey of innumerable birds, reptiles, and insects: while probably not a pair out of many millions of this unhappy race get into a place of safety, fulfil the first law of nature, and lay the foundation of a new community. In this state many fall into the neighbouring waters, and are eaten with avidity by the Africans. The author found them delicate, nourishing, and wholesome, without sauce or other help from cookery than merely roasting them in the manner of coffee.

The few fortunate pairs who happen to survive this annual massacre and destruction, are represented by the author as being usually found by some of the labourers, that are continually running about on the surface of the ground, and are elected kings and queens of new states. Those who are not so elected and preserved certainly perish, and most probably in the course of the following day. By these industrious creatures the king and queen elect are immediately protected from their innumerable enemies, by inclosing them in a chamber of clay; where the business of propagation soon commences. Their "voluntary subjects" then busy themselves in constructing wooden nurseries, or apartments entirely composed of wooden materials, seemingly joined together with gums. Into these they afterwards carry the eggs produced from the queen, lodging them there as fast as they can obtain them from her. The author even furnishes us with plausible reasons to believe, that they here form a kind of garden for the cultivation of a species of microscopic mushroom; which Mr Konig (in an Essay on the East Indian Termites, read before the Society of Naturalists of Berlin) conjectures to be the food of the young insects. But perhaps the most wonderful, and at the same time best authenticated, part of the history of these singular insects, is that which relates to the queen or mother of the community in her pregnant state.

After impregnation, a very extraordinary change begins to take place in her person, or rather in her abdomen only. It gradually increases in bulk, and at length becomes of such an enormous size as to exceed the bulk of the rest of her body 1500 or 2000 times. She becomes 1000 times heavier than her consort, and exceeds 20,000 or 30,000 times the bulk of one of the labourers. In this state, the matrix has a constant peristaltic or undulating motion; the consequence of which is (as the author has counted them) (fig. 8.) the protrusion of 80,000 eggs in 24 hours.

These eggs, says the author, "are instantly taken from her body by her attendants (of whom there always are, in the royal chamber and the galleries adjacent, a sufficient number in waiting) and carried to the nurseries, which are sometimes four or five feet distant in a straight line.—Here, after they are hatched, the young are attended and provided with every thing necessary, until they are able to shift for themselves, and take their share of the labours of the community."

Many curious and striking particulars are related of the

great devastations committed by this powerful community; which construct roads, or rather covered ways, diverging in all directions from the nest, and leading to every object of plunder within their reach. Though the mischiefs they commit are very great, such is the economy of nature, that it is probably counterbalanced by the good produced by them; in quickly destroying dead trees and other substances, which, as the author observes, would, by a tedious decay, serve only to encumber the face of the earth. Such is their alacrity and dispatch in this office, that the total destruction of deserted towns is so effectually accomplished, that in two or three years a thick wood fills the space; and not the least vestige of a house is to be discovered.

From the many singular accounts here given of the police of these insects, we shall mention one respecting the different functions of the labourers and soldiers, or the civil and military establishments in this community, on an attempt to examine their nest or city.

On making a breach in any part of the structure with a hoe or pick-axe, a soldier immediately appears, and walks about the breach, as if to see whether the enemy is gone, or to examine whence the attack proceeds. In a short time he is followed by two or three others, and soon afterwards by a numerous body, who rush out as fast as the breach will permit them; their numbers increasing as long as any one continues to batter the building. During this time they are in the most violent bustle and agitation; while some of them are employed in beating with their forceps upon the building, so as to make a noise that may be heard at three or four feet distance. On ceasing to disturb them, the soldiers retire, and are succeeded by the labourers, who hasten in various directions towards the breach, each with a burden of mortar in his mouth ready tempered. Though there are millions of them, they never stop or embarrass each other; and a wall gradually arises that fills up the chasm. A soldier attends every 600 or 1000 of the labourers, seemingly as a director of the works; for he never touches the mortar, either to lift or carry it. One in particular places himself close to the wall which they are repairing, and frequently makes the noise above mentioned; which is constantly answered by a loud hiss from all the labourers within the dome: and at every such signal, they evidently redouble their pace, and work as fast again.

The work being completed, a renewal of the attack constantly produces the same effects. The soldiers again rush out, and then retreat, and are followed by the labourers loaded with mortar, and as active and diligent as before. "Thus, says the author, the pleasure of seeing them come out to fight or to work alternately may be obtained as often as curiosity excites or time permits: and it will certainly be found, that the one order never attempts to fight, or the other to work, let the emergency be ever so great." The obstinacy of the soldiers is remarkable. "They fight to the very last, disputing every inch of ground so well as often to drive away the negroes, who are without shoes, and make white people bleed plentifully through their stockings."

Such is the strength of the buildings erected by these puny insects, that when they have been raised to little more than half their height, it is always the practice of the wild bulls to stand as centinels upon them, while the rest of the herd is ruminating below. When at their full height of

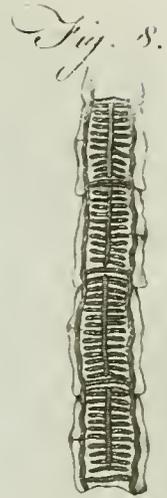

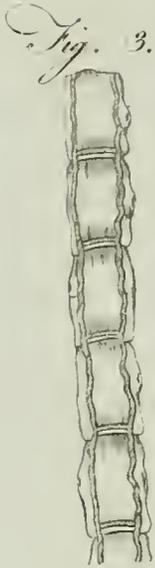

10 or 12 feet, they are used by the Europeans as places to look out from over the top of the grass, which here grows to the height of 13 feet upon an average. The author has stood with four men on the top of one of these buildings, in order to get a view of any vessel that might come in sight.

It may appear surprising how a Being perfectly good should have created animals which seem to serve no other end but to spread destruction and desolation wherever they go. But let us be cautious in suspecting any imperfection in the Father of the Universe. What at first sight may seem only productive of mischief, will, upon mature deliberation, be found worthy of that wisdom which planned the most beautiful parts of the world. Many poisons are valuable medicines; the storms are beneficial; and diseases often promote life. These termites, indeed, are frequently pernicious to mankind, but they are also very useful and even necessary; one valuable purpose which they serve is, to destroy decayed trees and other substances, which, if left on the surface of the ground in hot climates, would in a short time pollute the air. In this respect they resemble very much the common flies, which are regarded by mankind in general as noxious, and at best as useless beings in the creation; but this is certainly for want of consideration. There are not probably in all nature animals of more importance; and it would not be difficult to prove, that we should feel the want of one or two species of large quadrupeds much less than of one or two species of these despicable-looking insects. Mankind in general are sensible that nothing is more disagreeable, or more pestiferous, than putrid substances; and it is apparent to all who have made observation, that those little insects contribute more to the quick dissolution and dispersion of putrescent matter than any other. They are so necessary in all hot climates, that even in the open fields a dead animal or small putrid substance cannot be laid upon the ground two minutes before it will be covered with flies and their maggots, which instantly entering quickly devour one part, and perforating the rest in various directions, expose the whole to be much sooner dissipated by the elements. Thus it is with the termites; the rapid vegetation in hot climates, of which no idea can be formed by any thing to be seen in this, is equalled by as great a degree of destruction from natural as well as accidental causes (A). It seems apparent, that when any thing whatever is arrived at its last degree of perfection, the Creator has decreed it shall be totally destroyed as soon as possible, that the face of nature may be speedily adorned with fresh productions in the bloom of spring, or the pride of summer: so when trees, and even woods, are in part destroyed by tornadoes or fire, it is wonderful to observe how many agents are employed in hastening the total dissolution of the rest; but in the hot climates there are none so expert, or who do their business so expeditiously and effectually, as these insects, who in a few weeks destroy and carry away the bodies of large trees, without leaving a particle behind, thus clearing the place for other vegetables, which soon fill up every vacancy; and in places where two or three years before there has been a populous town, if the inhabitants, as is frequently the case, have chosen to abandon it, there shall be a very thick wood, and not the vestige of a post to be seen, unless the wood has been of a species which, from its hardness, is called *iron wood*.

Fig.

(A) The Guinea grass, which is so well known and so much esteemed by our planters in the West Indies, grows in Africa, as we have already mentioned, thirteen feet high upon an average, which height it attains in about five or six months; and the growth of many other plants is as quick.

Tenia.

Termites.

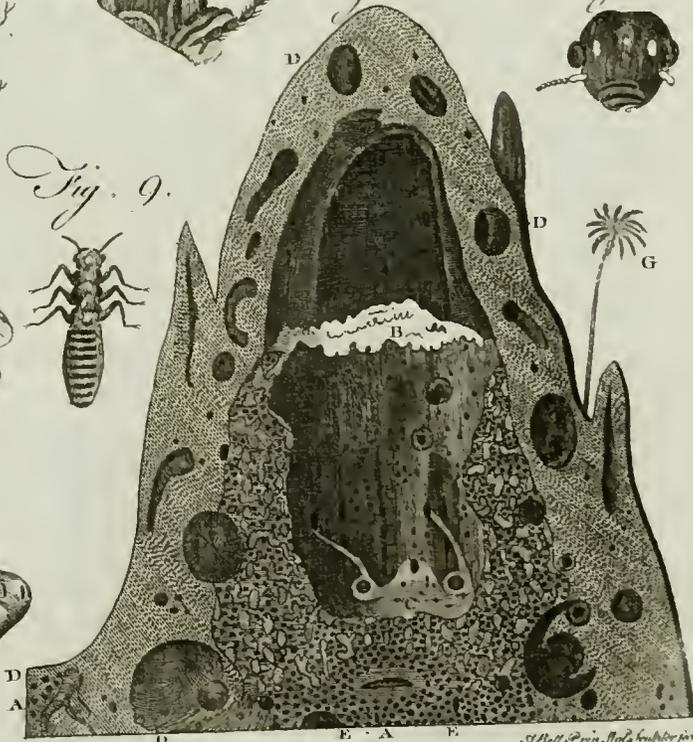

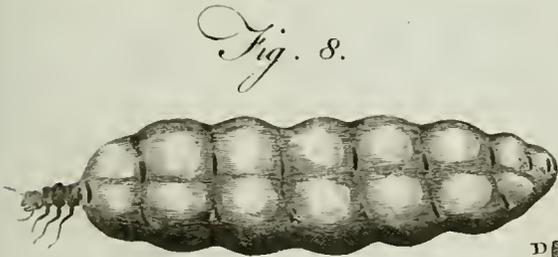

Fig. 1. represents a labourer. Fig. 2. a labourer magnified. Fig. 3. a soldier. Fig. 4. a soldier, forceps, and part of his head magnified. Fig. 5. a perfect termes bellifcosus. Fig. 6. the head of a perfect insect magnified. Fig. 7. a head with stemmata magnified. Fig. 8. a queen. Fig. 9. a king. Fig. 10. is a section of the building raised by these insects, as it would appear on being cut down through the middle from the top a foot lower than the surface of the ground. AA, an horizontal line from A on the left, and a perpendicular line from A at the bottom, will intersect each other at the royal chamber. The darker shades near it are the empty apartments and passages, which it seems are left so for the attendants on the king and queen, who, when old, may require near 100,000 to wait on them every day. The parts which are the least shaded and dotted are the nurseries, surrounded, like the royal chamber, by empty passages, on all sides, for the more easy access to them with the eggs from the queen, the provision for the young, &c. N. B. The magazines of provisions are situated without any seeming order among the vacant passages which surround the nurseries. B, the top of the interior building, which often seems, from the arches carrying upward, to be adorned on the sides with pinnacles. C, the floor of the area or nave. DDD, the large galleries which ascend from under all the buildings spirally to the top. EE, the bridges.

TERMINALIA, in antiquity, feasts celebrated by the Romans in honour of the god Terminus.

TERMINALIA, in botany; a genus of plants belonging to the class of *polygamia*, and order of *monocia*. The male calyx is quinquepartite; there is no corolla; the stamina are ten in number. The hermaphrodite flower is the same with that of the male; there is one style; the fruit, which is a drupe or plum, is below, and shaped like a boat. There are two species; the catappa, and angustifolia or benzoin. This species does not, however, yield benzoin. See STRAX.

TERMINI, in architecture, denotes a kind of statues or columns, adorned on the top with the figure of a man's, woman's, or satyr's head, as a capital; and the lower part ending in a kind of sheath or scabbard.

TERMINUS, in Pagan worship, an ancient deity among the Romans, who presided over the stones or land marks, called *termini*, which were held so sacred, that it was accounted sacrilege to move them; and as the criminal became devoted to the gods, it was lawful for any man to kill him. The worship of this deity was instituted by Numa Pompilius, who, to render land marks, and consequently the property of the people, sacred, erected a temple on the Tarpeian mount to Terminus.

TERN, in ornithology. See STERNA.

TERNATE, the most northerly of the Molucca or Clove Islands in the East Indies. It abounds in cocoa-nuts, bananas, citrons, oranges, almonds, and other fruit proper to the torrid zone; but cloves are the most valuable produce. It is in the possession of the Dutch. Malaya is the capital town. E. Long. 129. 0. N. Lat. 1. 0.

TERNI, a town of Italy in the Pope's territories, and in the duchy of Spoleto, with a bishop's see. It is but a small place; though there are very beautiful ruins of antiquity, it having been a very considerable Roman colony. It is situated on the top of a high mountain, and to the west of it are fields which are extremely fertile. E. Long. 12. 40. N. Lat. 42. 34.

TERNSIROMIA, in botany; a genus of plants belonging to the class of *polyandria*, and order of *monogyuia*. The calyx is monophyllous and quinquepartite: the corolla is monopetalous, quinquepartite or sexpartite, globular, and

bell-shaped: the berry is dry, bilocular, and valveless. There is only one species, the meridionalis.

TERPANDER, a celebrated Greek poet and musician. The Oxford marbles tell us that he was the son of Derdeneus of Lesbos, and that he flourished in the 381st year of these records; which nearly answers to the 27th Olympiad, and 671st year B. C. The marbles inform us likewise, that he taught the *nomos*, or airs, of the lyre and flute, which he performed himself upon this last instrument, in concert with other players on the flute. Several writers tell us that he added three strings to the lyre, which before his time had but four; and in confirmation of this, Euclid and Strabo quote two verses, which they attribute to Terpander himself.

The tetrachord's restraint we now despise,
The seven-string'd lyre a nobler strain supplies.

Among the many signal services which Terpander is said to have done to music, none was of more importance than the notation that is ascribed to him for ascertaining and preserving melody, which before was traditional, and wholly dependent on memory. The invention, indeed, of musical characters has been attributed by Alypius and Gaudentius, two Greek writers on music, and upon their authority by Boethius, to Pythagoras, who flourished full two centuries after Terpander. But Plutarch, from Heraclides of Pontus, assures us that Terpander, the inventor of *nomos* for the cithara, in hexameter verse, set them to music, as well as the verses of Homer, in order to sing them at the public games: And Clemens Alexandrinus, in telling us that this musician wrote the laws of Lycurgus in verse, and set them to music, makes use of the same expression as Plutarch; which seems clearly to imply a written melody.

After enumerating the airs which Terpander had composed, and to which he had given names, Plutarch continues to speak of his other compositions; among which he describes the poems, or hymns to the cithara, in heroic verse. These were used in after-times by the Rhapsodists, as prologues or introductions to the poems of Homer and other ancient writers. But Terpander rendered his name illustrious, not less by his performances both upon the flute and cithara than by his compositions. This appears by the marbles already mentioned; by a passage in Athenæus, from the historian Hellanicus, which informs us that he obtained the first prize in the musical contests at the Carnean games; and by the testimony of Plutarch, who says, that "no other proof need be urged of the excellence of Terpander in the art of playing upon the cithara, than what is given by the register of the Pythic games, from which it appears that he gained four prizes successively at those solemnities.

Of the works of this poet only a few fragments are now remaining.

TERRA AUSTRALIS INCOGNITA, a name for a large unknown continent, supposed to lie towards the South Pole, and which for a long time was sought after by navigators. The late voyages of Captain Cook have ascertained this matter as much as it probably ever will be. (See *SOUTH-SEA*, *Cook's Discoveries*, n^o 47, 48, 68, 69. and *AMERICA*, n^o 4). On this subject Captain Cook expresses himself as follows: "I had now made the circuit of the Southern Ocean in a high latitude, and traversed it in such a manner as to leave not the least room for the possibility of there being a continent, unless near the pole, and out of the reach of navigation. By twice visiting the tropical sea, I had not only settled the situation of some old discoveries, but made there many new ones, and left, I conceive, very little more to be done even in that part. Thus I flatter myself,

Terpander,
Perra.

Terra.

that the intention of the voyage has in every respect been fully answered; the southern hemisphere sufficiently explored; and a final end put to the searching after a southern continent, which has at times engrossed the attention of some of the maritime powers for near two centuries past, and been a favourite theory amongst the geographers of all ages. That there may be a continent, or large tract of land near the pole, I will not deny: on the contrary, I am of opinion there is; and it is probable that we have seen a part of it. The excessive cold, the many islands, and vast floats of ice, all tend to prove that there must be land to the south; and for my persuasion that this southern land must lie or extend farthest to the north, opposite to the Southern Atlantic and Indian Oceans, I have already assigned some reasons; to which I may add, the greater degree of cold experienced by us in these seas than in the Southern Pacific Ocean under the same parallels of latitude."

TERRA Firma, in geography, is sometimes used for a continent, in contradistinction to islands.

TERRA Firma, otherwise called *New Castile*, or *Castilla del Oro*, a country of America, bounded on the north by the North Sea and part of the Atlantic Ocean, by the same sea and Guiana on the east, by the country of the Amazons and Peru on the south, and by the Pacific Ocean and Veragua on the west. It lies between 62 and 83 degrees of west longitude, and between the equator and 12 degrees of north latitude; being upwards of 1200 miles in length from east to west, and 800 in breadth from north to south. It had the name of *Castilla del Oro* from the quantities of gold found in the districts of Uraha and other parts; and was first discovered by the celebrated Columbus in his third voyage.

The climate is neither pleasant nor healthy; the inhabitants one part of the year being scorched by the most intense and burning heat, and the other almost drowned with perpetual floods of rain, pouring from the sky with such violence as if a general deluge was to ensue.

In so large a tract of country the soil must necessarily vary. Accordingly, in some parts it is a barren sand, or drowned mangrove land, that will scarce produce any kind of grain; in others it yields Indian corn, balms, gums, and drugs, almost all manner of fruits as well of Old as of New Spain, sugar, tobacco, Brasil wood, and several other kinds of dyeing woods; a variety of precious stones, particularly emeralds and sapphires; venison and other game. The plantations of cacao, or chocolate nuts, in the district of the Caraccas, are esteemed the best in America. The mountains abound with tygers, and, according to some, with lions, and great numbers of other wild beasts. The rivers, seas, and lakes, teem with fish, and also with alligators; and the bowels of the earth were once furnished with the richest treasures, now almost exhausted. The same may be said of the pearl fisheries on the coast, which are far from being so profitable now as formerly.

Terra Firma is a very mountainous country. Terra Firma Proper, in particular, consists of prodigious high moun-

tains, and deep valleys flooded more than half the year. The mountains in the provinces of Carthagena and St Martha, according to Dampier, are the highest in the world; being seen at sea 200 miles off: from these run a chain of hills of almost equal height, quite through South America, as far as the Straits of Magellan, called the *Cordilleras des Andes*. The province of Venezuela also, and district of the Caraccas, the most northerly parts of South America, are almost a continued chain of hills, separated by small valleys, pointing upon the coast of the North Sea. A chain of barren mountains, almost impassable, runs through the province of Popayan from north to south, some whereof are volcanoes; but towards the shores of the Pacific Ocean it is a low country, flooded great part of the year.

The principal rivers of Terra Firma are, the Darien, Chagetre, Santa Maria, Conception, Rio Grande or Magdalena, Maricambo, and Oroonoko.

Terra Firma contains the provinces of Terra Firma Proper or Darien, of Carthagena, St Martha, Rio de la Hacha, Venezuela, Comana, New Andalusia or Paria, New Granada, and Popayan.

Terra Firma Proper lies in the form of a crescent, about the spacious bay of Panama, being the isthmus which joins South and North America; and extending in length between the two seas 300 miles, but in breadth, where the isthmus is narrowest, only 60. Here are found gold mines, gold sands, and fine pearls; and though the land is generally rough, there are some fruitful valleys, watered by rivers, brooks, and springs. The chief places are Panama and Portobello.

The inhabitants of Terra Firma have never been thoroughly subdued, and in all probability never will; as they are a brave and warlike people, have retreats inaccessible to Europeans, and bear an inveterate enmity to the Spaniards. See *DARIEN*.

TERRA Japonica, more commonly called *catechu*, a drug formerly supposed to be an extract from the seeds of the areca catechu, but lately discovered by Mr Kerr, assistant surgeon to the civil hospital at Bengal, to be obtained from the *mimosa catechu*. Mr Kerr gives the following account of the manner in which the extract is made: "After felling the trees, the manufacturer carefully cuts off all the exterior white part of the wood. The interior coloured wood is cut into chips, with which he fills a narrow-mouthed unglazed earthen pot, pouring water upon them until he sees it among the upper chips; when this is half evaporated by boiling, the decoction, without straining, is poured into a flat earthen pot, and boiled to one third part; this is set in a cool place for one day, and afterwards evaporated by the heat of the sun, stirring it several times in the day. When it is reduced to a considerable thickness, it is spread upon a mat or cloth, which has previously been covered with the ashes of cow-dung; this mass is divided into square or quadrangular pieces by a string, and completely dried by turning them frequently in the sun until they are fit for sale (A)."

This extract is called *cutt* by the natives, by the English.

(A) "In making the extract, the pale brown wood is preferred, as it produces the fine whitish extract; the darker the wood is, the blacker the extract, and of less value. They are very careful in drying their pots upon the fire before they are used; but very negligent in cutting their chips upon the ground, and not straining the decoction; by which, and the dirty ashes they use, there must be a considerable quantity of earth in the extract, besides what avarice may prompt them to put into it.

"The antiseptic quality of catechu appears from the experiments made by Sir John Pringle. Huxham employed it successfully in cases where a putrid dissolved state of the blood prevailed. This extract is the principal ingredient in an ointment of great repute in India, composed of catechu four ounces, alum nine drams, white resin four ounces; these are reduced

lish *cutch*, and by different authors *terra japonica*, *catechu*, *khaath*, *cate*, *cuchou*, &c. "In its purest state it is a dry pulverable substance, outwardly of a reddish colour, internally of a shining dark brown, tinged with a reddish hue; in the mouth it discovers considerable astringency, succeeded by a sweetish mucilaginous taste." According to Lewis, "it dissolves almost totally in water, excepting the impurities; which are usually of the sandy kind, and amounting in the specimens I examined to about one eighth of the mass. Of the pure matter, rectified spirit dissolves about seven eighths into a deep red liquor: the part which it leaves undissolved is an almost insipid mucilaginous substance."

Uses. Catechu may be usefully employed for most purposes where an astringent is indicated, provided the most powerful be not required. But it is particularly useful in alvine fluxes; and where these require the use of astringents, we are acquainted with no one equally beneficial. Besides this, it is employed also in uterine profusivity, in laxity and debility of the viscera in general, in catarrhal affections, and various other diseases where astringents are necessary. It is often suffered to dissolve leisurely in the mouth, as a topical astringent for laxities and exulcerations of the gums, for aphthous ulcers in the mouth, and simular affections. This extract is the basis of several fixed formulæ in our pharmacopœias, particularly of a tincture and an electuary: but one of the best forms under which it can be exhibited, is that of a simple infusion in warm water, with a proportion of cinnamon or cassia; for by this means it is at once freed from its impurities, and improved by the addition of the aromatic.

TERRA Puzzolana. See PUZZOLANA.

TERRÆ Filius, Son of the Earth, a student of the university of Oxford, formerly appointed in public acts to make satirical and jesting speeches against the members thereof, to tax them with any growing corruptions, &c.

TERRA Sigillata Lemnia. See ADANSONIA.

TERRACE, a walk or bank of earth, raised in a garden or court to a due elevation for a prospect. The name is also given to the roofs of houses that are flat, and whereon we may walk.

TERRAQUEOUS, in geography, a name given to our globe, because consisting of land and water.

TERRAS, or *TERRAS*, in mineralogy, a species of argillaceous earth. It differs but little in its principles from puzzolana, but is much more compact and hard, porous and spongy. It is generally of a whitish yellow colour, and contains more heterogeneous particles, as spar, quartz, shoerl, &c. and something more of calcareous earth; it effervesces with acids, is magnetic, and fusible *per se*. When pulverized, it serves as a cement, like puzzolana. It is found in Germany and Sweden.

A species of red earth has been found in the parish of St Elizabeth in Jamaica, which turns out to be an excellent substitute for terras or puzzolana earth, and may therefore be of great value to the inhabitants of the West Indies.

One measure of this earth, mixed with two of well-sacked lime and one of sand, form a cement that answers extremely well for building any dam or bridge, or any structure in water, for it will soon harden and become like a stone.

TERRASSON (Abbé John), a French writer born at

Lyons in 1663. He distinguished himself in the dispute concerning Homer, between La Motte and Madam Dacier, by writing a *Dissertation contre l'Iliade*. He wrote a political and moral romance called *Setbois*, full of learning and philosophy; and another capital work of his is a French translation of Diodorus Siculus. He died in 1750.

TERRE Verte, in the colour-trade, the name of a green earth much used by painters, both singly for a good standing green, and in mixture with other colours. The name is French, and signifies "green earth."

It is an indurated clay, of a deep bluish green colour, and is found in the earth, not in continued strata or beds, as most of the other earths are, but in large flat masses of different sizes, imbedded in other strata; these break irregularly in the cutting, and the earth is generally brought out of the pit in lumps of different sizes. It is of a fine, regular, and even structure, and not very hard. It is of an even and glossy surface, very smooth to the touch, and in some degree resembling the morochthus or French chalk, but adhering firmly to the tongue. It does not stain the hands in touching it; but being drawn along a rough surface, it leaves an even white line, with a greenish cast.

It does not ferment with acids, and it burns to a dusky brown colour. It is dug in the island of Cyprus, and in many parts of France and Italy. That from the neighbourhood of Verona has been esteemed the best in the world; but of late there has been some dug in France that equals it. There is also an earth dug on Mendip Hills, in the sinking for coal, which, though wholly unobserved, is nearly, if not wholly, of equal value. When scraped, and the finer parts separated, it is ready to be made up with oil for the use of the painters, and makes the most true and lasting green of any simple body they use.

TERRESTRIAL, something partaking of the nature of earth, or belonging to the globe of earth; thus we say, the terrestrial globe, &c.

TERRIER, a small hound to hunt the fox or badger; so called because he creeps into the ground, as ferrets do into the coney-burrows, after the fox, &c.

TERRITORY, in geography, denotes an extent or compass of land, within the bounds or belonging to the jurisdiction of any state, city, or other subdivision of a country.

TERROR. See FEAR and FRIGHT.

TERTIAN FEVER. See MEDICINE, n^o 125.

TERTULLIAN, or *QUINTUS SEPTIMIUS FLORENS TERTULLIANUS*, a celebrated priest of Carthage, was the son of a centurion in the militia, who served as proconsul of Africa. He was educated in the Pagan religion; but being convinced of its errors, embraced Christianity, and became a zealous defender of the faith. He married, it is thought, after his baptism. Afterwards he took orders, and went to Rome; where, during the persecution under the emperor Severus, he published his Apology for the Christians, which is, in its kind, a masterpiece of eloquence and learning; and at the beginning of the third century he embraced the sect of the Montanists. He lived to a very great age, and died under the reign of Antoninus Caracalla, about the year 216. Many of his works are still extant, in all of which he discovers a great knowledge of the Holy Scriptures, a lively imagination, a strong, elevated, and impetuous style, great eloquence and strength of reasoning; but is some-

reduced to a fine powder, and mixed with the hand, adding olive oil ten ounces, and a sufficient quantity of water, to bring the mass to the consistence of an ointment. To all sores and ulcers in warm climates astringent applications of this kind are found to be peculiarly useful."

Teruncius sometimes obscure. His Apology and Prescriptions are most esteemed. The best editions of his works are those of Rigault; especially that of Venice in 1746, folio. Pamellius and Alix, Mr Thomas, and the Sieur du Fossé, have written his life; and Rigault, M. de P'ube Epine, Father Petau, and other learned men, have published notes on his works.

TERUNCIUS, in antiquity, a very small brass coin in use among the Romans.

The inconvenience of such very small pieces being soon found, the teruncius became disused, but its name is still retained in reckoning, and thus it became a money of account. The teruncius at first was a quarter of the as, or libra; hence, as the as contained twelve ounces, the teruncius contained three, whence the name, which is formed of the Latin *tres uncie*. Teruncius was also used for the quarter of the denarius; so that when the denarius was at ten as, the teruncius was worth two and a half; and when the denarius was risen to sixteen, the teruncius was worth four. See **DENARIUS**.

TESSELATED PAVEMENTS, those of rich Mosaic work made of curious square marbles, bricks, or tiles, called *tessels* from their resembling dice.

TESSERA, in Roman antiquity, denoted in its primary sense a cube or dye; so called from the Greek word *τεσσαρα*, or *τεσσαρα*, four; respect being had to its number of sides, distinct from the two horizontal planes above and below. And it was thus distinguished from the talus, which being round at each end, contained only four planes or faces on which it could stand; and therefore when thrown had no more than two side faces in view. Hence *ludere talis et ludere tessera* is spoken of by Roman writers as two different games. The syllable **TES**, occurs often in Roman inscriptions. The word *tessera* was applied to many other things, not so much from a similitude in the figure, as from the relation they bore to some other thing of which they were the sign or token; as the points on the upper plane of the dye denoted the good or ill success of the cast.

The *tessera hospitalis* was either public or private. As to the former, we find among the inscriptions published by Gruter instances of two municipal towns which put themselves under the patronage of the Roman governor; and the reciprocal engagement between them, engraved on two copper plates, in the form of an oblong square, with a pediment at the top, is called in both *tessera hospitalis*. The design of it was to cultivate or maintain a lasting friendship between private persons and their families; and gave a mutual claim to the contracting parties and their descendants of a reception and kind treatment at each other's houses, as occasion offered. For which end those tesserae were so contrived as best to preserve the memory of that transaction to posterity. And one method of doing this was by dividing one of them lengthwise into two equal parts; upon each of which one of the parties wrote his name, and interchanged it with the other. From this custom came the prevailing expression *tesseram hospitalem infringere*, applied to persons who violated their engagements.

The *tessera frumentaria* were small tallies given by the emperors to the populace at Rome, entitling them to the reception of a quantity of corn from the public at stated seasons. The person who had the inspection of these was called *tesserarius*. They were made of wood and of stone.

There was another kind of tessera which intitled persons to a sight of the public games and other diversions, usually made in the form of an oblong square.

The *tessera militaris* was a signal given by the general, or chief commander of an army, as a direction to the soldiers

for executing any duty or service required of them. This, upon urgent occasions, was only vocal; but, in ordinary cases, it was written on a tablet, commonly made of wood. Beside these civil and military tesserae, there are others which relate to religious affairs, and may be called *sacred*.

TESSON, or **TESTON**. See **TESTER**.

TESSOUWA, a considerable town in Africa, situated east of Mourzouk, the capital of the kingdom of Fezzan. Near this town a deep and rapid stream is said to have existed, but was overwhelmed by the moving sands so frequent in Africa.

TEST, a vessel used in metallurgy for absorbing the scoria of metallic bodies when melted. See **CUPEL**.

Some of the German writers recommend, both for tests and cupels, a sort of friable opake stone, called *white spath*, which appears to be a species of gypsum, or of the stones from which plaster of Paris is prepared. The spath is directed to be calcined with a gentle fire, in a covered vessel, till the slight crackling, which happens at first, has ceased, and the stone has fallen in part into powder: the whole is then reduced into subtle powder, which is passed through a fine sieve, and moistened with so much of a weak solution of green vitriol as is sufficient for making it hold together. Gellert, however, finds, that if the stone is of the proper kind, which can be known only by trials, calcination is not necessary. Scheffer observes, that these kinds of tests are liable to soften or fall asunder in the fire, and that this inconvenience may be remedied by mixing with the uncalcined stone somewhat less than equal its weight, as eight-ninths of such as has been already used and is penetrated by the scoria of the lead, taking only that part of the old test which appears of a green-grey colour, and rejecting the red crust on the top. Tests or cupels made of the spath are said not to require so much caution in heating and heating them as the common ones; it appears, however, from Scheffer's account, that they are less durable than those made of the ashes of bones, though greatly superior to those of wood-ashes. Vegetable ashes, which stand pretty well the testing of silver, can scarcely bear any great quantity of gold, this metal requiring a considerably stronger fire than the other; but bone-ashes answer so effectually, and are among us so easily procurable, that it is not needful for the refiner to search for any other materials; though those who work off large quantities of lead, in order to gain a little silver or gold contained in it, may possibly, in places remote from populous cities, avail themselves of substances similar to the spath above-mentioned.

The test, for its greater security, is fixed in the mould in which it was formed; which is sometimes a shallow vessel made of crucible earth or cast-iron, more commonly an iron hoop, with three bars arched downwards across the bottom, about two inches deep, and of different widths, from three or four inches to fifteen or more, according to the quantity of metal to be tested at once. The ashes or earthy powder, moistened as for making cupels, are pressed down in the mould so as to completely fill it or rise a little above the sides; with care to make the mass equally solid, and to put in at once, or at least after the bottom has been pressed close, as much of the matter as will be sufficient for the whole; for any additional quantity will not unite thoroughly with the rest, but be apt to part from it in the fire. The edges are pared smooth, and a portion cut out from the middle with a bent knife, so as to leave a proper cavity, which is smoothed by strewing some dry powder on the surface, and rolling on it a wooden, or rather a glass ball.

The process of testing is often performed in the same manner

manner as that of cupellation : but where great quantities of base metal are to be worked off from a little gold, recourse is had to a more expeditious method, that of testing before the bellows.

An oval test is placed in a cavity, made in a hearth of a convenient height, and some moistened sand or ashes pressed round it to keep it steady : the nose of a bellows is directed along its surface, in such a manner, that if ashes are sprinkled in the cavity of the test, the bellows may blow them completely out : some have an iron plate fixed before the bellows, to direct the blast downwards. To keep the surface of the test from being injured in putting in the metal, some cloths or pieces of paper are interposed. The fuel consists of billets of barked oak laid on the sides of the test, with others laid crosswise on these : the bellows impel the flame on the metal, clear the surface of ashes or sparks of coal, hasten the scoriafication of the lead, and blow off the scoria, as fast it forms, to one end of the test, where it runs out thro' a notch made for that purpose. About two thirds of the scoriafied lead may thus be collected ; the rest being partly absorbed by the test, and partly dissipated by the action of the bellows. Care must be taken not to urge the blast too strongly, lest some portion of the gold should be carried away by the fumes impetuously forced off from the lead, and some minute particles of it entangled and blown off with the scoriae.

TEST-ACT, in law, is the statute 25 Car. II. cap. 2. which directs all officers, civil and military, to take the oaths, and make the declaration against transubstantiation, in the court of King's Bench or Chancery, the next term, or at the next quarter-sessions, or (by subsequent statutes) within six months after their admission ; and also within the same time to receive the sacrament of the Lord's Supper, according to the usage of the church of England, in some public church, immediately after divine service or sermon, and to deliver into court a certificate thereof, signed by the minister and church warden, and also to prove the same by two credible witnesses, upon forfeiture of 500l. and disability to hold the said office.

The avowed object of this act was to exclude from places of trust all members of the church of Rome ; and hence the dissenters of that age, if they did not support the bill when passing through the two houses of parliament, gave it no opposition. For this part of their conduct they have been often censured with severity, as having betrayed their rights from resentment to their enemies. But is this a fair state of the case ? Were any rights in reality betrayed ? That the dread of a popish successor and of popish influence was the immediate and urgent cause of passing the *test-act*, is indeed true ; but that the legislature, when guarding against an impending evil, had not likewise a retrospect to another from which they had to recently been delivered, is not so evident. If it be proper to support an established church as a branch of the constitution, and if the *test-act* be calculated to afford that support to the church of England, it is probable that the deliberations of parliament were as much influenced by the dread of puritanic fury, and a renewal of the covenant, as by apprehensions of a persecution from a popish king and popish councils. That the members of the church established by law in England had as much reason to dread the effects of power in the hands of Puritans as in the hands of Papists, no impartial man will controvert, who is not a stranger to that period of our national history ; and that it was the duty of the legislature by every method in their power to provide for the security of the constitution against the machinations of both its enemies, will be admitted by all but such as are in love

with anarchy on the one hand, or with despotism on the other.

Many people, when they talk or write of the *test-act*, seem to think that it was framed in opposition to the religious opinions of the church of Rome ; and finding the Protestant dissenters, who abhor these opinions, deprived by it of their civil rights, they speak with indignation of a law which confounds the innocent with the guilty. But all this proceeds from a palpable mistake of the purpose of the test. As the legislature had no authority to make laws against any opinions whatsoever, on account of their being false in theology ; so it is not to be supposed that, in their deliberations on the *TEST-ACT*, the members of that august body took into their consideration the comparative orthodoxy of the distinguishing tenets of the Catholics and Puritans. As a religious test they might esteem the latter much more than the former ; but if they found that both had combined with their theological doctrines opinions respecting civil and ecclesiastical government, inconsistent with the fundamental principles of the English constitution, they had an undoubted right to enact a law, by which none should be admitted to offices, in the execution of which they could injure the constitution, without previously giving security that their administration should support it in all its branches. It had not then been doubted, nor is there reason to doubt yet, but that an established religion is necessary, in conjunction with civil government, to preserve the peace of society ; and therefore in every well regulated state an established religion must be supported, not because it is the duty of the civil magistrate to conduct his subjects to future happiness, but because he cannot without such an establishment preserve among them present tranquillity. The establishment which must best answer this purpose, is that which, teaching the great and unchangeable duties of morality, is most acceptable in its government and forms of worship to the majority of the people ; and therefore in giving a legal establishment to one constitution of the church in preference to all others, it is only this circumstance, and not the comparative purity of the rival churches, viewed merely as ecclesiastical corporations, to which it is the business of the legislature to pay attention. At the time when the *test-act* passed the two houses of parliament, the established church of England was certainly more acceptable to the great body of the people and to all ranks in the state, than any one of the sects, whether Catholic or Protestant, which dissented from her ; and therefore it was the duty of the legislature to preserve to that church all her privileges and immunities, and to prevent those hostile sectaries from doing her injury in the discharge of any civil office with which they might be entrusted. It was with this view that the *test-act* was formed ; and it is with the same view that the legislature has hitherto rejected every petition for its repeal. In doing so, it deprives no man of his rights, far less of rights which conscience calls upon him to maintain at every hazard ; for the rights of individuals to hold civil offices are not inherent, but derived from the legislature, which of course must be the judge upon what terms they are to be held. The legislature of England has excluded from many offices, civil and military, every man who will not give security, that in the discharge of his public duty he will support the church established by law ; and as the test of his intention, it requires him, before he enters upon his office, to renounce the doctrine of transubstantiation, and receive the sacrament of the Lord's Supper in some public church, according to the liturgy of the church of England. Whether this be the most proper test that could have been exacted, may well be questioned ; but that in a country abounding with sectaries of various deno-

Test. minations, who agree in nothing but venomous hostility to the religious establishment, *some* test is necessary, seems incontrovertible, if it be the business of the legislature to preserve the public peace.

To this it will be replied, That the public peace in Scotland is preserved without a test, and that therefore a test cannot be necessary in England. This is plausible, but not conclusive. For forty years after the Revolution, there was in Scotland no denomination of Christians but those of the Presbyterian church, established by law, the Protestant Episcopalians, whose church had been established prior to that event, and the adherents to the church of Rome. The Episcopalians and Papists were effectually excluded from every office in which they could injure the ecclesiastical establishment, by the several restrictions under which they were laid, on account of their attachment, real or supposed, to the abdicated family of Stuart. The penal laws operated upon them more powerfully than a religious test. It is to be observed too, that in the church of Scotland, though her clergy are better provided for than any other parochial clergy (perhaps in Europe, *a*), there is nothing of that splendour and temporal power which in England excite envy to clamour against the establishment, under the pretence of maintaining the cause of religious liberty. Yet even in Scotland a religious test is occasionally exacted of civil officers. In the royal boroughs of that part of the united kingdom, no man can hold the office of a magistrate without previously swearing the burghers-oath (see *SECEDER*, n° 8.); and every instructor of youth, whether in school or colleges, may be called upon to qualify himself for his office, by subscribing the established Confession of Faith. The burghers-oath is a more effectual test than that which is required of magistrates in England; for a man might with a safe conscience receive the sacrament of the Lord's Supper occasionally in a church, "at which he would not swear to abide and defend the same to his life's end." This test appears to us to be necessary in boroughs, where faction is commonly blended with fanaticism; and if those sectaries which, at their first appearance in 1712, were insignificant, if not contemptible, continue to multiply, and to imbibe principles much more pernicious than those which were held by their fathers, it may perhaps be found expedient to extend some test over the whole country.

We do not, however, by any means, wish to see the sacramental test introduced into Scotland. A test may be necessary to secure to the church all her rights and immunities; but to receive the sacrament can give her no such security, whilst it leads inevitably to the profanation of a sacred ordinance. A much better test would be, to require every man, before he be admitted to an executive office, to swear that in the discharge of it he will be careful to maintain all the rights and privileges of the church established by law. Such an oath no sensible and peaceable dissenter could refuse; for it would not bind him to communicate with the established church; and he cannot be ignorant that it belongs not to the executive government, but to the legislature, to determine what shall be the religion of the

state. On this account, we cannot help thinking that the members of the legislative body should be subjected to no religious test whatever, that they may be at freedom to reform the corruptions of the church, or to exchange one establishment for another, should they find such an expedient. If this reasoning be just, it will be difficult to vindicate that clause of 25 Car. II. and of 1 Geo. I. in which it is enacted, that no member shall vote or sit in either house of parliament till he hath, in the presence of the house, subscribed and repeated the declaration against transubstantiation, the invocation of saints, and the sacrifice of the mass. The church of Rome is indeed a very corrupt society; but if it be not for the purity of her doctrine and government that any church is established in preference to all others, why should that particular church be precluded from the possibility of obtaining a legal establishment in Great Britain, even though she were to become most acceptable to the majority of all ranks in the kingdom? The English Catholics have unquestionably greater reason to complain of this test, than either they or the dissenters have to complain of the law which requires every civil and military officer to receive the Lord's Supper in the established church.

TESTACEA, in the Linnæan system of natural history, the third order of vermes. This order comprehends all shell-fish arranged by Linnæus under 36 genera. Shell-fish are animals with a soft body, covered by or inclosed in a firm, hard, and as it were stony habitation, composed, according to their three separate orders, 1st. Of many parts which are ranged under the name of *multivalves*; 2^d. Of two parts which are called *bivalves*; 3^d. Of one part or piece only, which we call *univalves*. Those parts, pieces, *Birbuz's Genera V. mium.* or valves, are more or less moveable at the animal's pleasure. The animals included in these hard habitations have most of them the characters of one or other of the genera vermium, and might be reduced under the same genera with the mollusca: but as these characters are few, and the shells very numerous, and different in their form and structure, it will tend more to make this part of natural history easy, to arrange the subjects according to the distinctions of the shells themselves.

There is this farther consideration in favour of this arrangement, viz that the animals themselves are rarely seen, and never can be preserved in cabinets; whereas the shells make a figure in them, and great numbers have been met with empty of the animal.

TESTACEOUS, in natural history, an epithet synonymous with **TESTACEA**.

In medicine, all preparations of shells, and substances of the like kind, are called *testaceous*. Such are powders of crabs claws and eyes, pearl, &c. Dr Quincy and others suppose the virtue of all testaceous medicines to be alike; that they seldom or never enter the lacteals, but that the chief of their action is in the first passages; in which, however,

(A) There are indeed many livings in the church of England, and probably in other churches, to which nothing in the church of Scotland can be compared in respect of emolument; but these rich benefices bear no proportion to the number of those which, in this age of unavoidable expence, cannot afford to the incumbents the means of decent subsistence as gentlemen. In the church of Scotland many livings amount to L. 200 each annually; and we have reason to hope, that when the present plan for augmenting the stipends of the clergy has been extended over Scotland, very few will be below L. 100; whilst in England the vicarages and small rectories, from which we have reason to believe that the incumbents reap not L. 80 a-year, greatly exceed in number all the livings in Scotland: Nay we doubt if there be not upwards of a thousand livings in England and Wales from which the rector or vicar derives not above L. 50 annually.

TESTAMENT ever, they are of great use in absorbing acidities. Hence they become of use in fevers, and especially in rectifying the many distempers in children, which generally owe their origin to such acidities.

TESTAMENT, or LAST WILL. Testaments both Justinian and Sir Edward Coke agree to be so called, because they are *testatio mentis*: an etymon which seems to favour too much of conceit; it being plainly a substantive derived from the verb *testari*, in like manner as *juramentum*, *incrementum*, and others, from other verbs. The definition of the old Roman lawyers is much better than their etymology; *voluntatis nostræ justa sententia de eo, quod quis post mortem suam fieri velit*: which may be thus rendered into English, "the legal declaration of a man's intentions, which he wills to be performed after his death." It is called *sententia*, to denote the circumspection and prudence with which it is supposed to be made: it is *voluntatis nostræ sententia*, because its efficacy depends on its declaring the testator's intention, whence in English it is emphatically styled his *will*; it is *justa sententia*; that is, drawn, attested, and published, with all due solemnities and forms of law: it is *de eo, quod quis post mortem suam fieri velit*, because a testament is of no force till after the death of the testator.

These testaments are divided into two sorts; written, and verbal or nuncupative; of which the former is committed to writing; the latter depends merely upon oral evidence, being declared by the testator in *extremis*, before a sufficient number of witnesses, and afterwards reduced to writing.

But as nuncupative wills and **CODICILS** (which were formerly more in use than at present when the art of writing is become more general) are liable to great impositions, and may occasion many perjuries, the statute of frauds, 29 Car. II. c. 3. enacts, 1. That no written will shall be revoked or altered by a subsequent nuncupative one, except the same be in the lifetime of the testator reduced to writing, and read over to him, and approved; and unless the same be proved to have been so done by the oaths of three witnesses at the least, who, by statute 4 & 5 Anne, c. 16. must be such as are admissible upon trials at common law. 2. That no nuncupative will shall in anywise be good, where the estate bequeathed exceeds 30l. unless proved by three such witnesses, present at the making thereof (the Roman law requiring seven), and unless they or some of them were specially required to bear witness thereto by the testator himself; and unless it was made in his last sickness, in his own habitation or dwelling-house, or where he had been previously resident ten days at the least, except he be surprised with sickness on a journey, or from home, and dies without returning to his dwelling. 3. That no nuncupative will shall be proved by the witnesses after six months from the making, unless it were put in writing within six days. Nor shall it be proved till fourteen days after the death of the testator, nor till process hath first issued to call in the widow, or next of kin, to contest it if they think proper. Thus hath the legislature provided against any fraud in setting up nuncupative wills, by so numerous a train of requisites, that the thing itself has fallen into disuse; and hardly ever heard of, but in the only instance where favour ought to be shown to it, when the testator is surprised by sudden and violent sickness. The testamentary words must be spoken with an intent to bequeath, not any loose idle discourse in his illness; for he must require the bystanders to bear witness of such his intention: the will must be made at home, or among his family or friends, unless by unavoidable accident, to prevent impositions from strangers: it must be in his last sickness; for if he recovers, he may alter his dispositions, and have time to make a writ-

ten will: it must not be proved at too long a distance from the testator's death, lest the words should escape the memory of the witnesses; nor yet too hastily and without notice, lest the family of the testator should be put to inconvenience or surpris'd.

As to written wills, they need not any witness of their publication. We speak not here of devises of lands, which are entirely another thing, a conveyance by statute, unknown to the feudal or common law, and not under the same jurisdiction as personal testaments. But a testament of chattels, written in the testator's own hand, though it has neither his name nor seal to it, nor witnesses present at its publication, is good; provided sufficient proof can be had that it is his hand-writing. And though written in another man's hand, and never signed by the testator, yet if proved to be according to his instructions and approved by him, it hath been held a good testament of the personal estate. Yet it is the safer and more prudent way, and leaves less in the breast of the ecclesiastical judge, if it be signed or sealed by the testator, and published in the presence of witnesses; which last was always required in the time of Bracton; or rather he in this respect has implicitly copied the rule of the civil law.

No testament is of any effect till after the death of the testator; *Nam Omne testamentum morte consummatum est, et voluntas testatoris est ambulatoria usque ad mortem.* And therefore, if there be many testaments, the last will overthrows all the former; but the republication of a former will revoke one of a later date, and establishes the first again.

Regularly, every person hath full power and liberty to make a will, that is not under some special prohibition by law or custom: which prohibitions are principally upon three accounts; for want of sufficient discretion; for want of sufficient liberty and free-will; and on account of criminal conduct.

1. In the first species are to be reckoned infants, under the age of 14 if males, and 12 if females; which is the rule of the civil law. For though some of our common lawyers have held that an infant of any age (even four years old) might make a testament, and others have denied that under 18 he is capable; yet as the ecclesiastical court is the judge of every testator's capacity, this case must be governed by the rules of the ecclesiastical law. So that no objection can be admitted to the will of an infant of 14, merely for want of age; but if the testator was not of sufficient discretion, whether at the age of 14 or 24, that will overthrow his testament. Madmen, or otherwise *non compos*, idiots or natural fools, persons grown childish by reason of old age or distemper, such as have their senses befotled with drunkenness, — all these are incapable, by reason of mental disability, to make any will so long as such disability lasts. To this class also may be referred such persons as are born deaf, blind, and dumb; who, as they have always wanted the common inlets of understanding, are incapable of having *animus testandi*, and their testaments are therefore void.

2. Such persons as are intestable for want of liberty or freedom of will, by the civil law are of various kinds; as prisoners, captives, and the like. But the law of England does not make such persons absolutely intestable; but only leaves it to the discretion of the court to judge upon the consideration of their particular circumstances of duress, whether or no such persons could be supposed to have *liberum animus testandi*. And, with regard to feme-coverts, our laws differ still more materially from the civil. Among the Romans there was no distinction; a married woman was as capable of bequeathing as a feme-sole. But with us a

Testament married woman is not only utterly incapable of devising lands, being excepted out of the statute of wills, 34 & 35 Hen. VIII. c. 5. but also she is incapable of making a testament of chattels, without the licence of her husband. For all her personal chattels are absolutely his own; and he may dispose of her chattels real, or shall have them to himself if he survives her: it would be therefore extremely inconsistent to give her a power of deviating that provision of the law, by bequeathing those chattels to another. The queen consort is an exception to this general rule, for she may dispose of her chattels by will, without the consent of her lord; and any feme-sole may make her will of goods which are in her possession *in aut. r. droit*, as executrix or administratrix; for these can never be the property of the husband; and if she has any pin-money or separate maintenance, it is said she may dispose of her savings thereof by testament, without the controul of her husband. But if a feme-sole makes her will, and afterwards marries, such subsequent marriage is esteemed a revocation in law, and entirely vacates the will.

3. Persons incapable of making testaments on account of their criminal conduct, are in the first place all traitors and felons, from the time of conviction; for then their goods and chattels are no longer at their own disposal, but forfeited to the king. Neither can a *felon de se* make a will of goods and chattels, for they are forfeited by the act and manner of his death; but he may make a devise of his lands, for they are not subject to any forfeiture. Outlaws also, though it be but for debt, are incapable of making a will so long as the outlawry subsists, for their goods and chattels are forfeited during that time. As for persons guilty of other crimes, short of felony, who are by the civil law precluded from making testaments (as uturers, libellers, and others of a worse stamp), at the common law their testaments may be good. And in general the rule is, and has been so at least ever since Glanvil's time, *quod libera sit cuiuslibet ultima voluntas*.

Testaments may be avoided three ways: 1. If made by a person labouring under any of the incapacities before-mentioned; 2. By making another testament of a later date; and, 3. By cancelling or revoking it. For though I make a last will and testament irrevocable in the strongest word, yet I am at liberty to revoke it; because my own act or words cannot alter the disposition of law, so as to make that irrevocable which is in its own nature revocable. For this, saith lord Bacon, would be for a man to deprive himself of that which, of all other things, is most incident to human condition; and that is, alteration or repentance. It hath also been held, that, without an express revocation, if a man, who hath made his will, afterwards marries and hath a child, this is a presumptive or implied revocation of his former will which he made in his state of celibacy. The Romans were also wont to lay aside testaments as being *inoffi. i. s. i.*, deficient in natural duty, if they disinherited or totally passed by (without assigning a true and sufficient reason) any of the children of the testator. But if the child had any legacy, though ever so small, it was a proof that the testator had not lost his memory or his reason, which otherwise the law presumed; but was then supposed to have acted thus for some substantial cause; and in such case no *querela inoffi. i. s. i. testamenti* was allowed. Hence probably has arisen that groundless vulgar error of the necessity of leaving the heir a killing, or some other express legacy, in order to disinherit him effectually; whereas the law of England makes no such wild supposition of forgetfulness or insanity; and therefore, though the heir or next of kin be totally omitted, it admits no *inoffi. i. s. i.* to set aside such a testament.

TESTAMENT, in Scots law. See LAW, n^o clxxx. 2. &c.

TESTAMENT (Old and New). See BIBLE and SCRIPT. Testamen-
TURF.

TESTATOR, the person who makes his will and testa-
ment.

TESTER, TESTON, the name of a coin struck in France by Louis XII. in 1513, and in Scotland in the time of Francis II. and Mary queen of Scotland, so called from the head of the king, which was engraved upon it. The silver it contained was 11 deniers 18 grains, its weight 7 deniers 11 $\frac{1}{4}$ grains, and its value 10 sols. The coinage of it was prohibited by Henry III. in 1575, when the value of it was augmented to 14 sols six deniers. The teston or tester among us was rated at 12 d. in the reign of Henry VIII. and afterwards reduced to 6d.

TESTES, in anatomy, the testicles. See the next article.

TESTICLE (*testis*), a double part in animals of the male kind, serving for the office of generation.—See ANATOMY, n^o 107. They are called *testicles*, by diminution of *testes*, “witnesses;” as giving testimony of virility. The Greeks call them *didymi*, or “twins.”

In man and most animals, the testicles are exterior; in some, as fowls, interior. Some men have only one, ordinarily they have two; some have naturally had three; nay, anatomists assure us they have known four.

TESTIMONY. See LOGIC, n^o 29. and METAPHYSICS, n^o 135—138.

TESTIMONY, in law. See EVIDENCE.

TESTUDO, the TORTOISE, in zoology; a genus belonging to the class of *amphibia*, and order of *reptilia*. The body has a tail, and is defended with a bony or coriaceous covering. The mouth has naked mandibles without teeth. There are 33 species, of which the *malus* or common tortoise is the most remarkable. It is found in the island of Ascension and other places in the South Sea. The shell is so very strong that it can carry more than 600lbs. on its back, or as many men as can stand on it loaded. It digs round holes in the sand, in which it lays a vast number of eggs yearly, to the amount of 1000, it is said. It broods on them during the night. Its flesh is of a greenish colour, makes excellent food, and is the favourite dish of sailors as well as of epicures. It lives on cuttle and shell fish, and grows to a prodigious size, some having been found to weigh 480 lbs.

The Americans find so good account in catching turtle, that they have made themselves very expert at it: they watch them from their nests on shore, in moon-light nights; and, before they reach the sea, turn them on their backs, and leave them till morning; when they are sure to find them, since they are utterly unable to recover their former posture; at other times they hunt them in boats, with a peculiar kind of spear, striking them with it through the shell; and as there is a cord fastened to the spear, they are taken much in the same manner as the whales.

Mr White, in his Natural History of Seborne, mentions a land-tortoise which had been kept for 30 years at Ringmer near Lewes. It retired under ground about the middle of November, and came forth again about the middle of April. At its first appearance in spring it showed little inclination for food; in the height of summer it became voracious; its appetite again diminished toward autumn, so that for the last six weeks it scarcely ate any thing at all. It lived chiefly on milky plants, such as lettuces, dandelions, and low-thistles. Nothing surprised Mr White more than the extreme timidity it always showed for rain; for though it had a shell that would secure it against the wheel of a loaded cart, yet it discovered as much solicitude about rain as a fine lady dressed in her best attire, shuffling away on the first sprink-
lings,

liage, and running its head up in a corner. It not only slept during winter, but for a great part of the summer; for it went to bed in the longer days at four in the morning, and often did not stir in the morning till it was late. There was one season usually about the beginning of June when its exertions were remarkable. It then rose by five in the morning, and walked on tip toe, traversing the garden examining every wicket and interstice in the fences. The motives that led it to these rambles seemed to be of the amorous kind. Mr White says it was an excellent weather-glass; for whenever it walked upright and fed with great avidity in the morning, it rained before night. It showed great sagacity in discerning those who did it kind offices; for whenever the old lady who had fed it for 30 years came in sight, it hobbled towards her with awkward alacrity.

TESTUDO, in antiquity, was particularly used among the poets, &c. for the ancient lyre; because it was originally made by its inventor Mercury, of the black or hollow of the testudo aquatica, or sea-tortoise, which he accidentally found on the banks of the river Nile. See **LYRE**.

TESTUDO, in the military art of the ancients, was a kind of cover or screen which the soldiers, *e. gr.* a whole company, made themselves of their bucklers, by holding them up over their heads, and standing close to each other. This expedient served to shelter them from darts, stones, &c. thrown upon them, especially those thrown from above, when they went to the assault.

TESTUDO, was also a kind of large wooden tower which moved on several wheels, and was covered with bullock-hides, serving to shelter the soldiers when they approached the walls to mine them, or to batter them with rams. It was called *testudo*, from the strength of its roof, which covered the workmen as the shell does the tortoise.

TETANUS, a dreadful spasmodic disorder, in which the whole body becomes rigid and inflexible. It most commonly proves mortal. See **MEDICINE**, n° 279.

TETHYS, a genus of insects belonging to the class of *verruis*, and order of *mollusca*. The body is oblong, fleshy, and without feet; the mouth consists of a cylindrical proboscis under the duplicature of a lip; and there are two foramina at the left side of the neck. The species are two, both inhabitants of the ocean.

TETRACERA, in botany; a genus of plants belonging to the class of *polyandria*, and order of *tetragynia*, and in the natural system ranging under the doubtful. The calyx is hexaphyllous, and the capules four. There is only one species, the *volubilis*.

TETRADYNAMIA, (*τετραεις* "four," and *δυναμις* "power"), four powers; the name of the 15th class in Linnæus's Sexual System, consisting of plants with hermaphrodite flowers, having six stamina, four of which are long, and two short; it corresponds to the *siliquosæ* of Ray, and *cruciformes* of Tournefort. All the species belonging to this class are distinguished by cruciform flowers. It comprehends two orders, *gymnospermia*, those plants which have naked seeds, being four in number, (except *phryma* which is monospermous); and *angiospermia*, which contains those plants the seeds of which are inclosed in a capsule. See **BOTANY**, p. 430.

TETRAGONIA, in botany; a genus of plants belonging to the class of *icosandria*, and order of *monogynia*; and in the natural system ranging under the 13th order, *succulentæ*. The calyx is divided into three, four, or five parts. There is no corolla; the drupe is beneath, and the nut three or eight-celled. There are seven species; the *puticosa*, *decumbens*, *herbacea*, *echinata*, *expansâ*, *crystallina*, and the *japonica*.

TETRAGRAMMATON, *τετραγραμματον*, a denomination given by the Greeks to the Hebrew name of God *יהוה*, "*Jehova*," because in the Hebrew it consists of four letters.

Tetragram-
maton
H
Tetrao.

TETRAGYNIA, (*τετραεις* "four," and *γυνη* "a woman"); the name of an order, or secondary division in the 4th, 5th, 6th, 8th, and 13th classes in the Sexual System; consisting of plants which, to the classic character, whatever it is, add the circumstance of having four styles or female organs. Herb-paris and grais of *Parnassus* furnish examples.

TETRANDRIA, (*τετραεις* "four," and *ανηρ* "a man or husband"); the name of the fourth class in Linnæus's Sexual System, consisting of plants with hermaphrodite flowers, which have four stamina or male organs that are of equal length. In this last circumstance consists the main difference, according to Linnæus, between the plants of the class in question and those of the 14th class *didynamia*, in which the four stamina are of unequal length, two of them being long, and two short.—The orders of this numerous class are three, founded upon the number of styles or female organs. Scabious, teazel, barren wort, the starry plants of Ray, and the greater number of genera in this class, have one style; dodder and hypecoam have two; holly and a few others have four.

TETRAO, in ornithology; a genus of birds belonging to the order of *gallinae*, and is thus characterized by Linnæus: There is a spot near the eyes naked or papillose, or covered, though more rarely, with feathers. Gmelin has enumerated about 66 species. The genus tetrao comprehended both the grouse, partridge, and quail; but Dr Latham, with great judgment and propriety, has made two genera of them, under the names of *tetrao*, comprehending the grouse; and *perdix*, comprehending the partridge and quail. Dr Latham thus distinguishes the genus *tetrao*: The bill is like a crooked cone, with a naked scarlet skin above each eye, and the feet feathered to the toes. The *perdix* he characterizes by a bill convex, strong, and short; the nostrils are covered above with a callous prominent rim; the orbits are papillose; the feet naked, and most of the species are furnished with spurs. He reckons 25 species under the *tetrao*, and 48 under the *perdix*. As we highly approve of this new arrangement of Dr Latham, we are disposed to follow it; but as a reference has been made from **PERDIX** to this place, it is proper that we should also give some account of that genus.

I. TETRAO. Of this genus the following species are found in Britain: 1. The *urogallus*, or wood cock, inhabits woody and mountainous countries; in particular, forests of pines, birch-trees, and junipers; feeding on the tops of the former and berries of the latter; the bird often infects the flesh with such a taste as to render it scarcely eatable. In the spring it calls the females to its haunts with a loud and shrill voice; and is at that time so very inattentive to its safety, as to be very easily shot. It stands perched on a tree, and descends to the females on their first appearance. They lay from 8 to 16 eggs; eight at the first, and more as they advance in age.

This bird is common to Scandinavia, Germany, France, and several parts of the Alps.—It is found in no other part of Great Britain than the Highlands of Scotland, north of Inverness; and is very rare even in those parts. It is there known by the name of *capercalzie*, *aver-calzie*, and in the old law-books *capercally*; the last signifying the horse of the woods: this species being, in comparison of others of the genus, pre-eminently large.

The length of the male is two feet nine inches; its weight sometimes 14 pounds. The female is much less, the

Tetrao. the length being only 26 inches. The sexes differ also greatly in colours. The bill of the male is of a pale yellow; the head, neck, and back, are elegantly marked, slender lines of grey and black running transversely. The upper part of the breast is of a rich glossy green; the rest of the breast and the belly black, mixed with some white feathers; the sides are marked like the neck; the coverts of the wings crossed with undulated lines of black and reddish brown; the exterior webs of the greater quill feathers are black; the tail consists of 18 feathers, the middle of which is the longest; these are black, marked on each side with a few white spots. The legs are very strong, and covered with brown feathers; the edges of the toes are pectinated. — Of the female, the bill is dusky; the throat red; the head, neck, and back, are marked with transverse bars of red and black; the breast has some white spots on it, and the lower part is of a plain orange colour; the belly is barred with pale orange and black; the tips of the feathers are white. The tail is of a deep rust-colour barred with black, tipped with white, and consists of 16 feathers.

2. The *tetrax*, black grouse, or black cock, like the former species, is fond of woody and mountainous situations; feeding on bilberries and other mountain fruits, and in the winter on the tops of the heath. In the summer they frequently descend from the hills to feed on corn. They never pair: but in the spring the male gets upon some eminence, crows and claps his wings; on which signal all the females within hearing resort to him. The hen lays seldom more than six or seven eggs. When the female is obliged, during the time of incubation, to leave her eggs in quest of food, she covers them up so artfully with moss or dry leaves, that it is very difficult to discover them. On this occasion she is extremely tame and tranquil, however wild and timorous at other times. She often keeps to her nest, though strangers attempt to drag her away. As soon as the young ones are hatched, they are seen running with extreme agility after the mother, though sometimes they are not entirely disengaged from the shell. The hen leads them forwards for the first time into the woods, to show them ant's eggs and the wild mountain berries, which, while young, are their only food. As they grow older their appetites grow stronger, and they then feed upon the tops of heather and the cones of the pine tree. In this manner they soon come to perfection: they are hardy birds, their food lies every where before them, and it would seem that they should increase in great abundance. But this is not the case; their numbers are thinned by rapacious birds and beasts of every kind, and still more by their own falacious contests. — As soon as the hatching is over, which the female performs in the manner of an hen, the whole brood follows the mother for about a month or two; at the end of which the young males entirely forsake her, and keep in great harmony together till the beginning of spring. At this season they begin for the first time to feel the ardent passions; and then adieu to all their former friendships! They begin to consider each other as rivals; and the rage of concupiscence quite extinguishes the spirit of society. They fight each other like game cocks; and at that time are so inattentive to their own safety, that it often happens that two or three of them are killed at a shot. It is probable, that in these contests the bird which comes off victorious takes possession of the female teraglio, as it is certain they have no faithful attachments.

An old black cock is in length 22 inches, and weighs near four pounds. The bill is dusky; and the plumage of the whole body black, glossed over the neck and rump with a shining blue. The coverts of the wings are of a dusky

brown; the inner coverts white; the thighs and legs are covered with dark brown feathers; the toes resemble those of the former species. The tail consists of 16 black feathers, and is much forked; the exterior feathers bend greatly outwards, and their ends seem as if cut off. — The female weighs only two pounds; and its length is one foot six inches. The head and neck are marked with alternate bars of dull red and black; the breast with dusky black and white; but the last predominates. The back, coverts of the wings, and tail, are of the same colours as the neck, but the red is deeper. The tail is slightly forked; it consists of 18 feathers variegated with red and black. The feathers under the tail are white, marked with a few bars of black and orange. This bird hatches its young late in the summer. It lays from six to eight eggs, of a dull yellowish white colour, marked with numbers of very small ferruginous specks; and towards the smaller end with some blotches of the same hue.

3. The *forticus*, red game, or moor fowl, is peculiar to the British islands. The male weighs about 19 ounces; and is in length 15½ inches. The bill is black; the irides hazel-coloured. The throat is red. The plumage on the head and neck is of a light tawny red; each feather is marked with several transverse bars of black. The back and scapular feathers are of a deeper red; and on the middle of each feather is a large black spot; the breast and belly are of a dull purplish brown, crossed with numerous narrow dusky lines; the quill-feathers are dusky; the tail consists of 16 feathers of an equal length, all of them (except the four middlemost) are black, and the middle feathers are barred with red: the thighs are of a pale red, barred obscurely with black; the legs and feet clothed to the very claws with thick soft white feathers. The claws are whitish, very broad and strong. The female weighs only 15 ounces. — The colours in general are duller than those of the male: the breast and belly are spotted with white; and the tips of some of the coverts of the wings are of the same colour. — These birds pair in the spring, and lay from six to ten eggs. The young brood follow the hen the whole summer; in the winter they join in flocks of 40 or 50, and become remarkably shy and wild; they always keep on the tops of the hills, are scarce ever found on the sides, and never descend into the valleys. Their food is the mountain-berries and tops of the heath.

4. The *lagopus*, white game or ptarmigan, is 15 inches in length, and weighs 19 ounces. Its plumage is of a pale brown or ash colour, elegantly crossed or mottled with small dusky spots and minute bars; the head and neck with broad bars of black, rust colour, and white: the belly and wings are white, but the shafts of the greater quill feathers black. In the male, the grey colour predominates, except on the head and neck, where there is a great mixture of red, with bars of white. The females and young birds have a great deal of rust colour in them. The tail consists of 16 feathers; the two middle of which are ash-coloured, mottled with black, and tipped with white; the two next black, slightly marked with white at their ends, the rest wholly black: the feathers incumbent on the tail are white, and almost entirely cover it.

Ptarmigans are found in these kingdoms only on the summits of the highest hills of the Highlands of Scotland, of the Hebrides, and Orkneys: and a few still inhabit the lofty hills near Kewick in Cumberland as well as the mountains of Wales. They live amidst the rocks, perching on the grey stones, the general colour of the strata in those exalted situations. They are very silly birds; so tame as to bear driving like poultry; and, if provoked to rise, take very short flights, making a great circuit like pigeons.

Like

Like the grouse, they keep in small packs; but never, like those birds, take shelter in the heath, but beneath loose stones. In the taste they scarce differ from a grouse.

These birds are called by Pliny *lagopi*, their feet being clothed with feathers to the claws, as the hare's are with fur: the nails are long, broad, and hollow. The first circumstance guards them from the rigour of the winter; the latter enables them to form a lodge under the snow, where they lie in heaps to protect themselves from the cold. The feet of the grouse are clothed in the same manner; but those of the two first species here described, which perch upon trees, are naked, the legs only being feathered, not being in want of such a protection.

II. *PERDIX*, comprehends both the partridge and quail.

The common partridge is so well known that a description of it is unnecessary, and we have not room to describe the foreign species. We refer those who wish complete information to the accurate and valuable System of Ornithology published by Dr Latham. The scientific ornithologist will find much satisfaction in his *Index Ornithologicus*, published in 2 vols 4to; and he who wishes to be acquainted with the nature and dispositions of birds, will read his *Synopsis* with pleasure, published in 7 vols 4to.

The following general account of the partridge will suffice: "These birds (says Willughby) hold the principal place in the feasts and entertainments of princes; without which their feasts are esteemed noble, vulgar, and of no account. The Frenchmen do so highly value, and are so fond of the partridge, that if they be wanting, they utterly slight and despise the best spread tables; as if there could be no feast without them." But however this might be in the times of our historian, the partridge is now too common in France to be considered as a delicacy; and this, as well as every other simple dish, is exploded for luxuries of a more compound invention. In England, where the partridge is much scarcer, and a great deal dearer, it is still a favourite delicacy at the tables of the rich; and the desire of keeping it to themselves has induced them to make laws for its preservation, no way harmonising with the general spirit of English legislation.

The partridge seems to be a bird well known all over the world, as it is found in every country and in every climate; as well in the frozen regions about the pole, as the torrid tracks under the equator. It even seems to adapt itself to the nature of the climate where it resides. In Greenland, the partridge, which is brown in summer, as soon as the icy winter sets in, begins to take a covering suited to the season: it is then clothed with a warm down beneath; and its outward plumage assumes the colour of the snow among which it seeks its food. Thus it is doubly fitted for the place, by the warmth and the colour of its plumage; the one to defend it from the cold, the other to prevent it being noticed by the enemy. Those of Barakonda, on the other hand, are longer legged, much swifter of foot, and choose the highest rocks and precipices to reside in.—They all, however, agree in one character, of being immoderately addicted to venery; and, as some writers affirm, often to an unnatural degree. It is certain, the male will pursue the hen even to her nest; and will break her eggs rather than not indulge his inclinations. Though the young ones have kept together in flocks during the winter, when they begin to pair in spring their society disperses; and combats, very terrible with respect to each other, ensue. Their manners in other circumstances resemble all those of poultry in general; but their cunning and instinct seem superior to those of the latter kinds. — Perhaps, as they live in the very neighbourhood of their enemies, they have more frequent occasion to put their little arts in practice, and learn by habit the means of eva-

sion or safety. Whenever therefore a dog or other formidable animal approaches their nest, the female uses every means to draw him away. She keeps just before him, pretends to be incapable of flying, just hops up, and then falls down before him, but never goes off so far as to discourage her pursuer. At length, when she has drawn him entirely away from her secret treasury, she at once takes wing, and fairly leaves him to gaze after her in despair. After the danger is over, and the dog withdrawn, she then calls her young, who assemble at once at her cry, and follow where she leads them. There are generally from 10 to 15 in a covey; and, if unmolested, they live from 15 to 17 years. There are several methods of taking them, as is well known; that by which they are taken in a net with a setting dog is the most pleasant, as well as the most secure. The dog, as every body knows, is trained to this exercise by a long course of education: by blows and caresses he is taught to lie down at the word of command; a partridge is shown him, and he is then ordered to lie down; he is brought into the field, and when the sportsman perceives where the covey lies, he orders his dog to crouch: at length the dog, from habit, crouches wherever he approaches a covey; and this is the signal which the sportsman receives for untolding and covering the birds with his net. A covey thus caught is sometimes fed in a place proper for their reception; but they can never be thoroughly tamed like our domestic poultry. See *PARTRIDGE* and *SHOOTING*.

2. The *coturnix*, or common quail, is not above half the size of the partridge. The feathers of the head are black, edged with rusty brown; the breast is of a pale yellowish red, spotted with black; the feathers on the back are marked with lines of pale yellow, and the legs are of a pale hue. Except in the colours thus described, and the size, it every way resembles a partridge in shape, and, except that it is a bird of passage, it is like all others of the poultry kind in its habits and nature.

The quail seems to spread entirely throughout the old world, but does inhabit the new; is seen from the Cape of Good Hope quite to Iceland, and is said to be found in Falkland Isles: also in New Zealand, throughout Russia, Tartary, and China*; and in short is mentioned by so many travellers, and in so many places, that we may almost call it an inhabitant of all. It is observed to shift quarters according to the season, coming northward in spring, and departing south in autumn, and in vast flocks, like other migrating birds. Twice in a year it comes in such vast quantities into Capri, that the bishop of the island draws the chief part of his revenue from them: hence he is called the *quail Bishop*. But this does not stand alone; almost all the islands in the Archipelago, on the opposite coasts, are at times covered with these birds, and some of them obtain a name from this circumstance. On the west coast of the kingdom of Naples, within the space of four or five miles, an hundred thousand have been taken in a day, which have been sold for eight livres per hundred to dealers who carry them for sale to Rome. Great quantities also sometimes alight in spring on the coasts of Provence, especially in the diocese of the bishop of Frejus, which is near the sea, and appear, at their first landing, so much fatigued that they are often taken by the hand. These circumstances then leave not a doubt of their being the same kind of birds which the divine hand of providence thought right to direct in such quantities as to cover the camp of the murmuring Israelites.

"In the autumn, great quantities are frequently imported into England from France for the table; which we have frequently seen (says Dr Latham) on their passage to London by the stage-coaches, about an hundred in a large square box, divided into five or six partitions one above another, just high enough

^{Tern}
^{van.}
enough to admit of the quails standing upright; these boxes have wires on the fore part, and each partition furnished with a little trough for food; and I have been told, says our author, they may be conveyed thus to great distances without difficulty."

With us they may be said not to be plenty at any time. They breed with us, and the major part migrate south in autumn; the rest only shift their quarters, as they have been met with on the coasts of Essex, and in Hampshire, in the winter-season, retiring there in October.

It feeds like the partridge, and like that bird makes no nest, except a few dry leaves or stalks scraped together may be called so, and sometimes an hollow on the bare ground suffices. In this the female lays her eggs to the number of six or seven, of a whitish colour, marked with irregular rust-coloured spots: the young follow the mother as soon as hatched, like young partridges. They have but one brood in a year.

Quail-fighting was a favourite amusement among the Athenians. They obtained from the flesh of this bird, deeming it unwholesome, as supposing that it fed upon the white hellebore; but they reared great numbers of them for the pleasure of seeing them fight; and staked sums of money, as we do with regard to cocks, upon the success of the combat. Fashion, however, has at present changed with regard to this bird: we take no pleasure in its courage, but its flesh is considered as a very great delicacy.—Quails are easily caught by a call: the fowler early in the morning having spread his net, hides himself under it among the corn; he then imitates the voice of the female with his quail-pipe, which the cock hearing, approaches with the utmost assiduity; when he has got under the net, the fowler then discovers himself, and terrifies the quail, who attempting to get away, entangles himself the more in the net, and is taken.

TETRODON, in ichthyology; a genus of fishes arranged by Linnaeus under the class of *amphibia*, and order of *nantes*; but placed by Gmelin under the class of *pisces*, and order of *branchioplegi*. The jaws are bony, stretched out, and cloven at the point; the aperture of the gills is linear; the body is mucated beneath, and there are no ventral fins. There are 13 species: of which the most remarkable is the *lineatus*, called by Mr Hasselquist *sabaka*, which is the Egyptian and Arabic name. It has of late been found in the Nile about Cairo, but was never known in former times. It is said to grow to a prodigious size. When just caught, it prickles the skin if it is taken in the bare hands, and produces small pustules in the same manner as nettles. The flesh is poisonous. Mr Forster confirms the account of the poisonous nature of a species of tetrodon, in his account of New Caledonia.

TETRARCH, a prince who holds and governs a fourth part of a kingdom. Such originally was the import of the title *tetrarch*; but it was afterwards applied to any petty king or sovereign; and became synonymous with *ethnarch*, as appears from the following considerations: 1. That Pliny makes mention of six tetrarchies within the city of Decapolis. 2. That Herod's kingdom was only divided into three parts, which yet were called *tetrarchies*, and the sovereigns thereof, Luke iii. 1. *tetrarchs*. 3. Josephus tells us, that, after the battle of Philippi, Antony, going into Syria, constituted Herod *tetrarch*; and on medals the same Herod is called *ethnarch*.

TETRASTYLE, in the ancient architecture, a building, and particularly a temple, with four columns in its front.

TETUAN, an ancient and pleasant town of Africa, in the kingdom of Fez, and in the province of Habata. It

is pretty well built, and the inhabitants are about 15,000 in number, who call themselves *shalahians*, and almost all speak Spanish; but they are great pirates. Some say there are 30,000 Moorish inhabitants, and 5000 Jews. W. Long, 5. 26. N. Lat. 35. 27.

TEUCRIUM, GERMANDER, in botany: A genus of plants belonging to the class of *didynamia*, and order of *gymnospermia*; and in the natural system ranging under the 42d order, *Verticillata*. The corolla has no upper lip, is divided into two parts beyond the base, and is divaricated where the stamina issue out. There are 30 species; of which the *scorodonia*, *scordium*, and *chamædrys*, are natives of Great Britain.

1. The *scorodonia*, wood-sage, or germander, is distinguished by leaves which are heart-shaped, serrated, and petiolated; by racemi, which are lateral and ranged in one row; and by an erect stem. The flowers are straw coloured, and the filaments red. The plant has a bitter taste, and smells like hops with a little mixture of garlic. It is used in brewing in the isle of Jersey instead of hops. 2. The *scordium*, or common water-germander, hath creeping perennial roots, sending up many square, procumbent, or trailing stalks, branching diffusely; oblong, indented, serrated, close sitting, opposite leaves; and small reddish flowers, generally two together, from the sides of the stalks and branches, in July and August. This plant was formerly considered as medicinal, but has now fallen into disuse. It grows naturally in marshy places, in the isle of Ely and other parts of England, and most parts of Europe; and is sometimes admitted into gardens, in moist places, for variety, and as a medical plant. 3. The *chamædrys*, or smaller creeping germander, hath fibrous, very creeping, spreading roots; many four cornered, very branchy, trailing stalks, near a foot long; oval, cuneiform, cut, crenated leaves on short footstalks; and reddish flowers, growing almost in a verticillus, or whorls, round the stalk, three on each peduncle; appearing in June and July.

TEUTHIS, in ichthyology, a genus of fishes belonging to the order of *abdominales*. The head is somewhat truncated on the forepart; the branchial membrane has five rays; the teeth equal, rigid near each other, forming a regular series. There are two species, the *hepatina* and *java*.

TEUTONES, or TEUTONI, (anc. geog.) a people always by historians joined with the Cimbri; both seated, according to Mela, beyond the Elbe, on the Sinus Codanus, or Baltic; and there, it is supposed, lay the country of the Teutones, now *Dünnish*; diversity of dialects producing the different terms *Tut*, *Tut*, *Dit*, *Tid*, and *Thad*, which in the ancient German language signified *people*. Of these Teutones, Virgil is to be understood in the epithet *Teutonicus*, an appellation which more lately came to be applied to the Germans in general, and later still the appellation *Alemanni*.

The Teutones, in conjunction with the Cimbri and Ambrones, made war on the Romans, and marched towards Italy in the year 101 B. C. We are told, that the Teutones alone were so numerous, that they were six whole days without intermission in passing by the Roman camp. In Transalpine Gaul they engaged the Roman consul Marius; but were defeated with incredible slaughter; 100,000 of them, according to the lowest calculations, being killed on the spot. According to others, the number of those killed and taken prisoners amounted to 290,000. The inhabitants of the neighbouring country made ferces for vineyards of their bones. Their king Teutobochus, said to be a monstrous giant, was taken prisoner and carried to Rome. See the article GIANT.

TEUTONIC, something belonging to the Teutones.

The

The Teutonic language is supposed to have been the language of the ancient Germans, and hence is reckoned amongst the mother-tongues. See PHILOLOGY, n^o 219.

TEUTONIC ORDER, an order of military knights, established towards the close of the twelfth century, on the following occasion.—When the emperor Barbarossa engaged in a crusade for the recovery of the Holy Land out of the hands of Saladin, he was followed by great numbers of German volunteers, who from various motives enlisted under his banners. After the death of Barbarossa, the Germans, who had signalized themselves before Acre or Ptolemais, resolved to choose another leader; and at last fixed their choice upon Frederic duke of Suabia, second son to the emperor, and Henry duke of Brabant. Under these generals they behaved with so much bravery, that Henry king of Jerusalem, the patriarch, and several other princes, determined to reward their valour by instituting an order of knighthood in their favour. This was accordingly done; and our new knights had at first the title of the *knights of St George*; afterwards it was thought proper to put them under the tutelage of the Virgin Mary, to whom there was already an hospital dedicated on Mount Zion, for the relief of German pilgrims. From this time they were called *Equites Mariani*, or knights of St Mary. Laws, regulations, and statutes, were drawn up for them by the Christian kings in Syria and the patriarch; and among other obligations it was required, that every person admitted to the privileges of the order should be of noble parentage; that the order should defend the Christian religion and the Holy Land; that they should exercise hospitality towards the Christians in general, but particularly those of their own country; and that they should with all their power endeavour to propagate and extend the Christian faith and the religion of JESUS. In the year 1190, having become rich by donations from the superstitious, they elected their first grandmaster, Henry Walpot, a German, who had distinguished himself by his zeal and valour; and their choice was confirmed by the emperor. The following year, pope Celestine III. confirmed their privileges already granted, giving them the title of the *Teutonic knights of the hospital of St Mary the Virgin*. By the conditions of this bull, they vowed perpetual continence, obedience, and poverty; obligations which it may well be imagined were not very strictly kept. See POLAND, n^o 59, 61, 67—69. and PRUSSIA, n^o 3, 4.

TEWKESBURY, a town in Gloucestershire, formerly noted for its monastery. It is now a large handsome corporation, containing about 500 houses, with a magnificent church. It is seated at the confluence of the rivers Severn and Avon, has a cotton manufactory, and sends two members to parliament. W. Long. 2. 14. N. Lat. 52. 0.

TEXEL, a town of the United Provinces, in north Holland, seated at the mouth of the Zuyder-Zee, with a good harbour, and a strong fort. It is seated in a fruitful island, known all over the world by the great number of ships that pass this way every day from all parts; it is about six miles long, and five broad, lying a little northward to the continent of Holland, between which and the island is one of the principal passages out of the Zuyder-Zee into the ocean. It is defended from the sea by land hills and strong banks. Most of the soil is applied to feed sheep, of which they have great flocks; and the cheese made of their milk is said to vie with the Parmesan. This island contains several fair villages, and a town on the east side, called *Burch*, strongly fortified and garrisoned, and inhabited chiefly by fishermen. N. Lat. 53. S. E. Long. 4. 51.

TEXT, a relative term, contradicting itself to gloss or commentary, and signifying an original discourse exclusive of any note or interpretation. This word is particularly

used for a certain passage of scripture, chosen by a preacher to be the subject of his sermon.

TEXTURE, properly denotes the arrangement and cohesion of several slender bodies or threads interwoven or entangled among each other, as in the webs of spiders, or in the cloths, stuffs, &c.

Texture is also used in speaking of any union or constituent particles of a concrete body, whether by weaving, hooking, knitting, tying, chaining, indenting, intruding, compressing, attracting, or any other way. In which sense we say, a close compact texture, a lax porous texture, a regular or irregular texture, &c.

TEWIT, in ornithology. See TRINGA.

THABOR. See TABOR.

THALES, a celebrated Greek philosopher, and the first of the seven wise men of Greece, was born at Miletus about 640 B. C. In order to improve himself in the knowledge of the sciences, he travelled into Egypt, where he discoursed with the priests and other learned men. Some say that he married; but others observe, that he eluded the solicitations of his mother on this head, by telling her, when he was young, that it was too soon; and afterwards, that it was too late. Thales acquired great reputation by his wisdom and learning: he was the first among the Greeks who foretold eclipses of the sun, and made extraordinary discoveries in astronomy. Thales was the author of the Ionian sect of philosophers, who were thus called from his being born at Miletus, a city of Ionia. He maintained that water was the principle of which all the bodies in the universe are composed; that the world was the work of God; and that God sees the most secret thoughts in the heart of man. He said, "That the most difficult thing in the world is to know ourselves; the most easy to advise others; and the most sweet to accomplish our desires. That, in order to live well, we ought to abstain from what we find fault with in others. That the bodily felicity consists in health, and that of the mind in knowledge. That the most ancient of beings is God, because he is uncreated: that nothing is more beautiful than the world, because it is the work of God; nothing more extensive than space, quicker than spirit, stronger than necessity, wiser than time." It was also one of his sentences, "That we ought never to say that to any one that may be turned to our prejudice; and that we should live with our friends as with persons that may become our enemies." He thanked God for three things; that he was born of the human, not of the brute species; a man, and not a woman; a Greek, and not a barbarian. None of the ancient philosophers ever applied themselves more earnestly to the study of astronomy than Thales. Diogenes Laertius reports, that leaving his lodging with an old woman to contemplate the stars, he fell into a ditch; on which the good woman cried, "How canst thou know what is doing in the heavens, when thou canst not perceive what is at thy feet?" He went to see Croesus, who was marching with a powerful army into Capadocia, and enabled him to pass the river Halys without making a bridge. Thales died soon after, at about 90 years of age. He composed several treatises in verse, on meteors, the equinoxes, &c. but they are all lost.

THALIA, in Pagan mythology, one of the nine muses. She presided over Comedy; and is represented crowned with a garland of ivy, holding a mask in her hand, and wearing buskins on her feet.

THALIA, in botany: A genus of plants belonging to the class of *monaulbria*, and order of *monogynia*; and in the natural system ranging under the 8th order, *Scitamineæ*. The corolla is pentapetalous and undulated; and the drupe has a

Texture
||
Thalia.

Thalic-
tium,
Thame.

bilocular kernels. There is only one species, the geniculata.

THALICTRUM, MEADOW RUE, in botany: A genus of plants belonging to the class of *polyandria*, and order of *polygynia*; and in the natural system ranging under the 26th order, *Malvifera*. There is no calyx: the petals are four or five in number, and the seeds are naked and without a tail. There are 15 species; three of which are indigenous, the *florum, minus*, and *alpinum*.

1. The *florum*, or common meadow-rue, has a leafy furrowed stalk, and a manifold erect panicle. It has commonly 24 flurins, and from 10 to 16 pistils. The root and leaves of this plant dye a yellow colour, and cattle are fond of it. It grows on the banks of some rivers: It is found at North Queen's-terry, Fifeshire. 2. The *minus*, or small meadow-rue, has fexpartite leaves, and bending flowers. The stalk is striated, and about a foot high; the leaves are lax and divaricated, having rigid toothstalks; they are smooth and glaucous, and their lobes generally trifid; the panicle is branched and open, and the flowers nod: the petals are pale green, tinged with red; the stamina are from 15 to 20; the seeds deeply striated, and from two to seven in number. This plant is frequent in sandy soils and mountainous pastures. 3. The *alpinum*, or alpine meadow-rue, has a very simple stalk, and almost naked; and a racemus simple and terminal. It is a pretty little plant, about a fingers-length in height; the leaves all rise from the root, the stalk being naked and branched; the flowers nod, and have 4 petals, 12 stamina, and 8 pistils. It is frequent on the sides of rivulets in the highland mountains and other places.

THAMES, the finest river in Great Britain, which takes its rise from a copious spring, called *Thames Head*, two miles south-west of Cirencester in Gloucestershire. It has been erroneously said, that its name is Isis till it arrives at Dorchester, 15 miles below Oxford, when, being joined by the Thame or Tame, it assumes the name of the Thames, which, it has been observed, is formed from a combination of the words Thame and Isis. What was the origin of this vulgar error, cannot now be traced. Poetical fiction, however, has perpetuated this error, and invested it with a kind of classical sanctity. "It plainly appears (says Camden), that the river was always called *Thames* or *Tems*, before it came near the Thame; and in several ancient charters granted to the abbey of Malmesbury, as well as that of Ensham, and in the old deeds relating to Cricklade, it is never considered under any other name than that of *Thames*." He likewise says, that it occurs nowhere under the name of Isis. All the historians who mention the incursions of Ethelwold into Wiltshire in the year 905, or of Canute in 1016, concur likewise in the same opinion, by declaring, that they passed over the Thames at Cricklade in Wiltshire. It is not probable, moreover, that Thames Head, an appellation by which the source has usually been distinguished, should give rise to a river of the name of Isis; which river, after having run half its course, should reassume the name of Thames, the appellation of its parent spring. About a mile below the source of the river is the first corn-mill, which is called *Kemble Mill*. Here the river may properly be said to form a constant current; which, though not more than nine feet wide in the summer, yet in the winter becomes such a torrent as to overflow the meadows for many miles around. But, in the summer, the Thames Head is so dry, as to appear nothing but a large dell, interspersed with stones and weeds. From Somertord the stream winds to Cricklade, where it unites with many other rivulets. Approaching Kenilworth, it again enters its native county, dividing it from Berkshire at Ingham. It widens considerably in its way to Lechlade; and being there joined by the Lech and Coln,

at the distance of 138 miles from London, it becomes navigable for vessels of 90 tons. At Ensham, in its course north-east, to Oxford, is the first bridge of stone; a handsome one, of three arches, built by the earl of Abingdon. Passing by the ruins of Godstow nunnery, where the celebrated Fair Rosamond was interred, the river reaches Oxford, in whose academic groves its poetical name of Isis has been so often invoked. Being there joined by the Charwell, it proceeds south-east to Abingdon, and thence to Dorchester, where it receives the Tame. Continuing its course south-east by Wallingford to Reading, and forming a boundary to the counties of Berks, Bucks, Surry, Middlesex, Essex, and Kent, it washes the towns of Henley, Marlow, Maidenhead, Windsor, Eton, Egham, Staines, Laleham, Chertsey, Weybridge, Shepperton, Walton, Sunbury, East and West Moulsey, Hampton, Thames Ditton, Kingston, Teddington, Twickenham, Richmond, Isleworth, Brentford, Kew, Mortlake, Barnes, Chiswick, Hammer-smith, Putney, Fulham, Wandsworth, Battersea, Chelsea, and Lambeth. Then, on the north bank of the river, are Westminster and London, and, on the opposite side, Southwark; forming together one continued city, extending to Limehouse and Deptford; and hence the river proceeds to Greenwich, Erith, Greenhithe, Gray's Thurrock, Gravesend, and Leigh, into the ocean. It receives in its course from Dorchester the rivers Kennet, Loddon, Coln, Wey, Mole, Wand, Lea, Roding, Darent, and Medway. The jurisdiction of the lord mayor of London over the Thames extends from Coln Ditch, a little to the west of Staines, to Yendal or Yenlet to the east, including part of the rivers Medway and Lea; and he has a deputy, named the water-bailiff, who is to search for and punish all offenders against the laws for the preservation of the river and its fish. Eight times a year the lord mayor and aldermen hold courts of conservance for the four counties of Surry, Middlesex, Essex, and Kent. Though the Thames is said to be navigable 138 miles above the bridge, yet there are so many flats, that in summer the navigation westward would be intirely stopped, when the springs are low, were it not for a number of locks. But these are attended with considerable expence; for a barge from Lechlade to London pays for passing through them 13l. 15s. 6d. and from Oxford to London 12l. 18s. This charge, however, is in summer only, when the water is low; and there is no lock from London Bridge to Bolter's Lock; that is, for 51½ miles above the bridge. The plan of new cuts has been adopted, in some places, to shorten and facilitate the navigation. There is one near Lechlade, which runs nearly parallel to the old river, and contiguous to St John's Bridge; and there is another a mile from Abingdon, which has rendered the old stream toward Culham Bridge useless. But a much more important undertaking has lately been accomplished; namely, the junction of this river with the Severn. A canal had been made, by virtue of an act of parliament in 1730, from the Severn to Wall Bridge, near Stroud. A new canal now ascends by Stroud, through the Vale of Chalford, to the height of 343 feet, by means of 28 locks, and thence to the entrance of a tunnel near Sapperton, a distance of near eight miles. The canal is 42 feet in width at top and 30 at the bottom. The tunnel (which is extended under Sapperton Hill, and under that part of earl Bathurst's grounds called *Haley Wood*, making a distance of two miles and three furlongs) is near 15 feet in width, and can navigate barges of 70 tons. The canal descending hence 134 feet, by 14 locks, joins the Thames at Lechlade, a distance of above 20 miles. In the course of this vast undertaking, the canal, from the Severn at Froomlade to Inghesham, where it joins the Thames, is a distance of more than 30 miles.

Frodo's
Gardner.

The expence of it exceeded the sum of 200,000*l.* of which 200*000* are said to have been expended in gunpowder alone, used for the blowing up of the rock. This new canal was completed in 1789, in less than seven years from its commencement. A communication, not only with the Trent, but with the Mersey, has likewise been effected by a canal from Oxford to Coventry; and an act of parliament has passed to extend another canal from this, at Eraunston, to the Thames at Brentford. This is to be called *The Grand Junction Canal*. On the extensive advantages resulting from these navigable communications from the metropolis with the ports of Bristol, Liverpool, Hull, &c. and the principal manufacturing towns in the inland parts of the kingdom, it is needless to expatiate. The tide flows up the Thames as high as Richmond, which, following the winding of the river, is 70 miles from the ocean; a greater distance than the tide is carried by any other river in Europe. The water is esteemed extremely wholesome, and fit for use in very long voyages, during which it will work itself perfectly fine.

THAMES is also the name of a river in the state of Connecticut in America. See the article *CONNECTICUT*.

THANE, or THANUS, a name given to the nobility in Britain before the time of William the Conqueror. It signifies a minister or honourable retainer, from the verb *thenian* "to minister." There were several degrees of nobility among the Anglo-Saxons; but those most commonly mentioned are the king's thanes and the alderman's thanes. The king's thanes seem to have been of three different degrees, according to their different degrees of wealth or favour at court. The alderman's thanes seem to have been of the lowest degree of nobility, and next to them those who were promoted to that dignity from their advancement in the church, from their valour, success in agriculture or commerce: for if a ceorl or farmer applied to learning and attained to priests orders, if he acquitted himself so well as to obtain from a nobleman five hythes of land, or a gilt sword, helmet, and breast-plate, the reward of his valour; or if by his industry he had acquired the property of five hythes of land; or if he applied to trade, and made three voyages beyond sea in a ship of his own, and a cargo belonging to himself—he was denominated a *thane*.

The thanes, who were the only nobility among the Anglo-Saxons, were a very numerous body of men, comprehending all the considerable landholders in England, and filling up that space in society between the ceorls or yeomanry on the one hand, and the royal family on the other; which is now occupied both by the nobility and gentry. In times of war, they constituted the flower of their armies, and in times of peace they swelled the trains of their kings, and added greatly to the splendour of their courts, especially at the three great festivals of Christmas, Easter, and Whitsuntide. From this body all the chief officers, both civil and military, as aldermen, greeves, earls, heretogens, &c. were taken; and to obtain some of these offices was the great object of their ambition. Before they obtained an office, their lands were their only support; and they lived in greater or less affluence, according to the extent of their estates. These they divided into two parts; one of which they called their *inlands*, and the other their *outlands*. Their inlands they kept in their own immediate possession, and cultivated them by the hands of their slaves and villains, in order to raise provisions for their families; their outlands they granted to ceorls or farmers, either for one year, or for a term of years; for which they received a certain stipulated proportion of their produce annually. These customs had long prevailed among their ancestors in Ger-

many, and were adhered to by their posterity in England till the conquest.

The thanes were under no obligations on account of their lands, except the three following, which were indispensably necessary to the defence and improvement of their country: To attend the king with their followers in military expeditions, to assist in building and defending the royal castles, and in keeping the bridges and highways in proper repair. To these obligations all proprietors of land (even the churchmen for a long time not excepted) were subjected; and these services were considered as due to their country, rather than to the persons of their kings; and were agreed to by all as being necessary to their own preservation and conveniency.

This title of thane was abolished in England at the conquest, upon the introduction of the feudal system by William. The titles of earl and baron were about the same period introduced into Scotland by Malcolm Canmore, and the title of thane fell into disuse.

THANE I, an island of the county of Kent, surrounded by the sea except on the north-east side, where it is bounded by the branches of the river Stour, now inconsiderable to what they were formerly. It contains several villages, and the sea-port towns of Margate and Ramsgate, and has the title of an earldom. It is celebrated for being the spot through which arts, sciences, and divine knowledge, came into this happy isle. The Britons called it *Richborough*, from its vicinity to the city of that name, now only a venerable ruin; but the Saxons called it *Thanet*, from fire, having so many beacons erected on it. It is in the north-east part of the county, lies open to the sea on the north and east, with the river Wantsum on the west and south, is about 10 miles long from the North Foreland to Saure-Bridge, and about 8 broad from Westgate to Sandwich-Ferry. The north part of it is all arable, except some barren land, that is sown with saintoin, which produces a load and sometimes two loads of lay upon an acre; by which means, the land that otherwise is not worth half-a-crown an acre yields 30*s.* or 40*s.* The south and west parts of the island are most of them marsh or pasture lands. The soil is generally very fertile, especially in the best of barley, and other sorts of grain, of which it is computed above 20,000 quarters are sent hence to London in a year, besides what is sold to other places. The *alga marina*, or sea-ore, as they call it, is their chief manure. This they dry on the shore, and burn, in order to make kelp, which the potters use in glazing their ware. But the smell of the rotten ore upon the soil, and the smoke of it when burning, is very noisome. The gentlemen's families are for the most part gone from this part of the county, having sold their estates; so that their mansion seats are converted into farm-houses; but then, on the other hand, many of the yeomen and farmers have good estates, on which they live very genteelly. In this island are ten parishes, but seven parish-churches, and one chapel.

THAPSIA, the DEADLY CARROT, in botany: A genus of plants belonging to the class of *pentandria*, and order of *dignia*; and in the natural system ranging under the 45th order, *umbellata*. The fruit is oblong and girt with a membrane. There are five species; the *villosa*, *foetida*, *asclepium*, *garganica*, and *trifoliata*. The roots of the *foetida* were formerly ordered in medicine, but are now entirely disused; a small dose operating with extreme violence both upwards and downwards.

THAWING, the resolution of ice into its former fluid state by the warmth of the air. See *CONGLATATION* and *FROST*.

THEA, in botany. See *TEA*.

*Theatines,
Theatre.*

THEATINES, a religious order in the Romish church, so called from their principal founder John Peter Carassa, then bishop of Theate, or Chieti, in the kingdom of Naples, and afterwards pope, under the name of *Paul IV.* The names of the other founders were Gaetan, Boniface, and Consilieri. These four pious men desiring to reform the ecclesiastical state, laid the foundation of an order of regular clerks at Rome in the year 1524. Pope Clement VII. approved the institution, and permitted the brethren to make the three religious vows, to elect a superior every three years, and to draw up statutes for the regulation of the order. They first endeavoured, by their example, to revive among the clergy the poverty of the apostles and first disciples of our Saviour, and were the first who assumed the title of *regular clerks.*

THEATRE, a place in which shows or dramatic representations are exhibited.

For the origin of the dramatic art we always turn our eyes to Greece, the nursery of the arts and sciences. It may indeed have been known among more ancient nations, but no records remain sufficient to support this opinion. The different states of Greece asserted their claim to the honour of having given it birth, but the account of the Athenians is most generally received. It derived its origin from the hymns which were sung in the festivals of Bacchus in honour of that deity. While these resounded in the ears of the multitude, choruses of Bacchants and Fauns, ranged round certain obscene images which they carried in triumphal procession, chanted lascivious songs, and sometimes sacrificed individuals to public ridicule.

This was the practice in the cities; but a still greater licentiousness reigned in the worship paid to the same divinity by the inhabitants of the country, and especially at the season when they gathered the fruits of his beneficence. Vintagers, besmeared with wine-lees, and intoxicated with joy and the juice of the grape, rode forth in their carts, and attacked each other on the road with gross sarcasms, revenging themselves on their neighbours with ridicule, and on the rich by publishing their injustice.

Among the poets who flourished at that time, some celebrated the great actions and adventures of gods and heroes, and others attacked with asperity the vices and absurdities of individuals. The former took Homer for their model, and supported themselves by his example, of which they made an improper use. Homer, the most tragic of poets, the model of all who have succeeded him, had in the *Iliad* and the *Odyssey* brought to perfection the heroic poem, and in his *Margites* had employed pleasantry. But as the charm of his works depends in a great measure on the passions and motion with which he knew to animate them, the poets who came after him endeavoured to introduce into theirs an action which might excite emotion or mirth in the spectators: some even attempted to produce both, and ventured certain rude essays, which have since been styled indifferently either tragedies or comedies, because they unite the characters of those two dramas. The authors of these sketches have been distinguished by no discovery; they only form in the history of the art a succession of names which it would be useless to recal to light.

The necessity and power of theatrical interest was already known. The hymns in honour of Bacchus, while they described his rapid progress and splendid conquests, became imitative; and in the contests of the Pythian games, the

players on the flute who entered into competition were enjoined by an express law to represent successively the circumstances that had preceded, accompanied, and followed the victory of Apollo over Python.

Some years after this regulation, Sufarion and Thepsis, both born in a small borough of Attica, named *Icaria*, appeared each at the head of a company of actors, the one on a kind of stage, the other in a cart (A). The former attacked the vices and absurdities of his time; and the latter treated more noble subjects, which he took from history.

The comedies of Sufarion were in the same taste with those indecent and satirical farces which were afterwards performed in some of the cities of Greece. They were long the favourite entertainment of the country people. Athens did not adopt this species of exhibition until after it was brought to perfection in Sicily.

Thepsis had more than once seen in the festivals, in which as yet hymns only were sung, one of the singers, mounted on a table, form a kind of dialogue with the chorus. From this hint he conceived the idea of introducing into the tragedies an actor who, by simple recitals introduced at intervals, should give relief to the chorus, divide the action, and render it more interesting. This happy innovation, together with some other liberties in which he had allowed himself, gave alarm to the legislator of Athens, who was more able than any other person to discern the value or danger of the novelty. Solon condemned a species of composition in which the ancient traditions were disguised by fictions. "If we applaud falsehood in our public exhibitions (said he to Thepsis), we shall soon find that it will insinuate itself into our most sacred engagements."

The excessive approbation and delight with which both the city and country received the pieces of Thepsis and Sufarion, at once justified and rendered useless the suspicious foresight of Solon. The poets, who till then had only exercised their genius in dithyrambs and licentious satire, struck with the elegant forms which these species of composition began to assume, dedicated their talents to tragedy and comedy. Soon after a greater variety was introduced in the subjects of the former of these poems. Those who judge of their pleasures only from habit exclaimed, that these subjects were foreign to the worship of Bacchus; but the greater number thronged with still more eagerness after the new pieces.

Phrynichus, the disciple of Thepsis, made choice of that kind of verse which is most suitable to the drama, and the author of some other changes, and left tragedy in its infancy.

Æschylus received it from his hands enveloped in a rude vestment, its visage covered with false colours, or a mask inexpressive of character, without either grace or dignity in its motions, inspiring the desire of an interest which it with difficulty excited, still attached to the buffooneries which had amused its infant years, and expressing its conceptions sometimes with elegance and dignity, but frequently in a feeble and low style, polluted with gross obscenities.

In his first tragedies he introduced a second actor; and afterward, copying the example of Sophocles, who had just entered on his theatrical career, he admitted a third, and sometimes even a fourth. By this multiplicity of personages, one of his actors became the hero of the piece, and attracted to himself the principal interest; and as the chorus now held only a subaltern station, Æschylus took care to shorten

(A) Sufarion represented his first pieces towards the year 580 before Christ. Some years after, Thepsis made his first attempts in tragedy, and acted his *Alceſtis* in 536.

Theatre. shorten its part, and perhaps even carried this precaution too far.

He is censured for having admitted mute characters into his drama. Achilles, after the death of his friend, and Niobe, after the destruction of her children, appear on the stage, and remain during several scenes motionless, with their heads covered with a veil, and without uttering a word; but if their eyes had overflowed with tears, and they had poured forth the bitterest lamentations, could they have produced an effect so terrible as this veil, this silence, and this abandonment to grief?

duced an action, all the parts of which had a dependence on each other; and conducted his subject, without wandering from it, through a just extent to a determinate end. His pieces, subjected to the same laws as tragedy, were known in Greece, where they were considered as models; and comedy soon shared with her rival the suffrages of the public, and the homage due to genius. The Athenians, especially, received her with the same transports as they would have testified at the news of a victory: many of their poets exercised their genius in this novel species of composition; and their names adorn the numerous list of writers who have been distinguished in comedy from the time of Epicharmus. Such were, among the more ancient, Magnes, Cratinus, Crates, Pherecrates, Eupolis, and Aristophanes. They all flourished in the age of Pericles.

It was not sufficient that the noble and elevated style of tragedy should leave in the minds of the auditors a strong impression of grandeur; to captivate the multitude, it was requisite that every part of the spectacle should concur to produce the same effect. It was then the general opinion that nature, by bestowing on the ancient heroes a more lofty stature, had impressed on their persons a majesty which procured them as much respect from the people as the ensigns of dignity by which they were attended. Æschylus therefore raised his actors on high stilts or buskins. He covered their features, which were frequently disagreeable, with a mask that concealed their irregularity. He clothed them in flowing and magnificent robes, the form of which was so decent, that the priests of Ceres have not blushed to adopt it. The inferior actors were also provided with masks and dresses suited to their parts.

If we peruse the comic pieces which have come down to us, we shall be convinced that the sole object of the authors was to please the multitude. The gods and heroes were travestied, gross and obscene language was often employed, and virulent invectives were often thrown out against individuals of the first rank for genius and virtue. Towards the end of the Peloponnesian war the licentiousness of comedy was restrained. The chorus was laid aside, because the rich citizens were alarmed, and would no longer contribute money to support it, nor provide masks with portraits for exposing individuals.

Instead of those wretched scaffolds which were formerly erected in haste, he obtained a theatre furnished with machines, and embellished with decorations. Here the sound of the trumpet was reverberated, incense was seen to burn on the altars, the shades of the dead to arise from the tomb, and the furies to rush from the gulphs of Tartarus. In one of his pieces these infernal divinities appeared, for the first time, with masks of a horrid paleness, torches in their hands, serpents intertwined in their hairs, and followed by a numerous retinue of dreadful spectres. It is said that, at the sight of them, and the sound of their terrific howlings, terror seized on the whole assembly, women miscarried, and children expired with fear; and that the magistrates, to prevent similar accidents in future, commanded that the chorus should consist only of fifteen actors instead of fifty.

The poets being thus restrained from mentioning names of living persons on the stage, invented false names. They still exposed real and known characters; and thus gave a more exquisite gratification to the spectators, who were highly amused with finding out the persons intended. The consequence of the law was only to make that done with delicacy which was formerly done in the most indecent and scurrilous manner. Aristophanes, in some of his latest pieces, has given us some good examples of this kind of comedy, which is sometimes called the middle comedy.

The effect of so many new objects could not but astonish the spectators; nor were they less surprised and delighted at the intelligence displayed in the performance of the actors, whom Æschylus almost always exercised himself. He regulated their steps, and taught them to give additional force to the action by new and expressive gestures.

Comedy was still liable to abuse, and therefore required farther reformation. As the use of real names had formerly been prohibited, real subjects were also forbidden; and comedy from that time was no longer a fury armed with torches, or a firebrand scattering mischief, but a pleasing and instructive companion. This is called the new comedy. The most eminent among the Greeks in this improved species was Menander. His writings are now lost; but we may form a good estimate of their merit from the comedies of Terence, which are said to have been borrowed from Menander, and to have nearly resembled the original, though inferior in that *vis comica* by which the elegant Grecian was distinguished. The comedy of Menander is that which has been cultivated in modern times.

The progress of the art was extremely rapid. Æschylus was born 525 years before Christ, 11 years after Thespis had acted his *Alektis*. He had for competitors Chærilus Pratenas, and Phrynichus, whose glory he eclipsed, and Sophocles, who rivalled his own. Sophocles was born about the year 497 B. C. about 14 years before Euripides. These carried tragedy to the highest perfection to which it attained among the Greeks. Æschylus painted men greater than they can be, Sophocles as they ought to be, and Euripides as they are.

To give some idea of a Grecian theatre, we shall describe very shortly the theatre of Bacchus in Athens, which was built by the famous architect Philo in the time of Pericles. The part intended for the spectators was of a semicircular form, at the diameter of which was erected the stage. The orchestra occupied the space where the pit in modern theatres is situated, where the music, the chorus, and the mimi were placed. It was four feet elevated above the ground. The spectators were arranged in three galleries round the sides of the orchestra except that next the stage, each gallery containing eight rows of seats. At the farther end of the orchestra, where the stage is erected in modern theatres, stood the thymele or logeon, but projecting a little towards the audience. It was a little higher than the orchestra, and did not extend the whole breadth of it. In some theatres it was only six feet square. Here the principal part of the chorus made their recitations, and in comical interludes the mimi performed. Behind the thymele

Introduced towards the 50th Olympiad (about 580 B. C.), and adapted to the rude manners of the rustics, comedy ventured not to approach the capital; and if by chance some companies of actors, who were unconnected with any others, found their way into the city, and performed their indecent farces, they were less authorized than tolerated by the government. It was not till after a long infancy that this species of drama began suddenly to make a rapid improvement in Sicily. Instead of a succession of scenes without connection or tendency, the philosopher Epicharmus intro-

and appeared the stage or proscenium, considerably elevated. No part of this theatre was covered except the stage, and a high gallery called *in us set apart* for the women. The Athenians, being exposed to the weather, came usually with great cloaks, to secure them from the rain or the cold; and for defence against the sun, they had the *scindion*, a kind of parasol, which the Romans used also in their theatres by the name of *umbella*; but when a sudden storm arose, the play was interrupted, and the spectators dispersed.

A sort of tent-work over the entire area of the edifice might have been contrived as a shelter from the rain and a shade from the sun. Such a covering would have obviated the inconveniences of roofed theatres, which obstruct the free communication of the air, and of unroofed theatres, which do not keep out the weather. At Athens the plays were always represented in the day-time, which made the unroofed theatres less inconvenient.

Plays were represented only during the three festivals solemnized in honour of Bacchus. The first of these was celebrated at the Piræus, where some of Euripides's pieces were first performed. The second, which lasted only one day, was kept at the end of January or beginning of February. The third, called the greater *Dionysia*, was celebrated a month after. It continued several days, and attracted a great multitude of spectators. In the festivals which lasted only one day, five or six dramatic pieces, either tragedies or comedies, were performed. But in the greater *Dionysia*, which continued longer, 12 or 15, and sometimes more, were acted. The performance began early in the morning, and sometimes lasted the whole day.

The chorus, according as the subject demanded, was composed of men and women, old men or youths, citizens or slaves, priests, soldiers, &c. to the number of 15 in tragedy, and 24 in comedy. The chorus came upon the stage preceded by a flute-player, who regulated their steps; sometimes one after the other, but in tragedy more frequently three in front and five in depth, or five in front and three in depth.

The same persons performed both in tragedy and comedy; but, as among ourselves, it was rare to meet with any who excelled in both. The pay of those who had acquired great reputation was considerable. Polus gained a talent in two days (equal to L. 225 Sterling*). Players of eminence were solicited by different actors of Greece to attend their festivals. If, after making an engagement, they failed, they were obliged to pay a certain sum of money; and if they were absent during the festivals of their own republic, they were condemned to a heavy fine.

The actors had habits and symbols suited to their parts. Kings wore a diadem, leaned on a sceptre which supported an eagle on its top, and were dressed in long robes of purple or other splendid colours ornamented with gold. Heroes, besides having their stature frequently increased to six feet English, and their bulk in proportion, were frequently covered with the skin of a lion or a tyger, and armed with swords, quivers, and clubs. All who suffered misfortunes wore a black, brown, or dirty white garment, which frequently hung in tatters. There were various kinds of masks for tragedy, comedy, and satire. These certainly took away the pleasure arising from the expression of the countenance; but at any rate, little pleasure could be derived from this circumstance in a Grecian theatre, from its immense size, and the great distance of the audience from the stage.

Dramatic entertainments were introduced at Rome in the year of the city 511. They were called *ludi scenici*, because they were first acted in a shade formed by the branches and leaves of trees. They were borrowed immediately from Etruria, whence also they received their first players. These

Etrurians at first only danced to a flute, without either singing or acting. The Roman youth soon imitated them at their solemn festivals, adding raillery in rude verses, and gestures adapted to the subject. These verses were called *læscœvini*, from *Læscœnia*, a city of Etruria. Livius Andronicus was the first poet who wrote a regular play in Latin. This happened in the year of Rome 512 or 514, about 160 years after the death of Sophocles and Euripides, and 52 after that of Menander. The Grecian model was afterwards introduced and cultivated much by succeeding dramatic writers. This was the model of Menander, for the old and middle comedy was unknown at Rome. As the Romans were only imitators of the Greeks in the dramatic art, as well as in most of the arts and sciences, nothing more is necessary to be said in addition to the account which we have already given of the Grecian stage.

The origin of the English stage is hid in obscurity. It was not, however, copied from the Grecian or Roman; for it was evidently different in form as well as in matter, and may with more propriety be deduced from a Gothic original. It appears that there were theatrical entertainments in England almost as early as the conquest; for we are told by William Stephanides or Fitz-Stephen, a monk, who in the reign of Henry II. wrote his *Descriptio Nobilissime Civitatis Londonie*, that "London, instead of the common interludes of the theatre, had plays of a more holy kind; representations of the miracles of confessors, and the sufferings of martyrs. At this time there were also certain sets of idle people, who travelled the countries and were called *Mummers*, a kind of vagrant comedians, whose excellence consisted altogether in mimicry and humour.

It is probable that, soon after this time, the dramatic representations called *Mysteries* were exhibited: These mysteries were taken from scripture-history: some represented the creation of the world, with the fall of Adam and Eve; some the story of Joseph; and others even the incarnation and sufferings of the Son of God. These pieces were exhibited in a manner so ridiculous as to favour libertinism and infidelity, as appears by a petition of the chaunters of St Paul's cathedral to Richard II. in 1378, praying, that "some unexpert people might be prohibited from representing the history of the Old Testament to the prejudice of the said clergy, who had been at great expence to represent it publicly at Christmas."

In the year 1390, the parish clerks of London are said to have played interludes at Skinner's-well on three successive days in July; and, in 1409, to have acted for eight days successively a play concerning the creation of the world, at the same place which thence acquired the name of *Clerkenwell*.

These Mysteries were succeeded by Moralities, in which there were some rude traces of a fable and a moral; and some also of poetry, the virtues, vices, and other affections of the mind being frequently personified.

After these Moralities came what were called Interludes, which made some approaches to wit and humour. Many of these pieces were written by John Heywood, jester to Henry VIII.

In the time of Henry VIII. one or two pieces had been published under the classical names of *Comedy* and *Tragedy*, but they appear not to have been intended for popular use. It was not till the religious ferment had subsided that the public had leisure to attend to dramatic poetry. In the reign of Elizabeth, tragedies and comedies began to appear in form, and could the poets have persevered, the first models were good. *Gorbuduc*, a regular tragedy, was acted in 1561; and Gascoigne, in 1566, exhibited *Jocasta*, a translation from Euripides, as also *The Supposes*, a regular comedy,

Theatre. comedy, from Ariosto, near thirty years before any of Shakespeare's were printed.

The people however still retained a relish for their old mysteries and moralities, and the popular dramatic poets seem to have made them their models. The graver sort of moralities appear to have given birth to our modern tragedy; as our comedy evidently took its rise from the lighter interludes of that kind. And as most of these pieces contain an absurd mixture of religion and buffoonery, an eminent critic has well deduced from thence the origin of our unnatural tragic-comedies. Even after the people had been accustomed to tragedies and comedies, moralities still kept their ground. One of them, intitled *The New Custom*, was printed so late as 1573. At length they assumed the name of *masques*, and, with some classical improvements, became in the two following reigns the favourite entertainments of the court.

As for the old mysteries, which ceased to be acted after the reformation, they seem to have given rise to a third species of stage exhibition; which, though now confounded with tragedy or comedy, were by our first dramatic writers considered as quite distinct from them both: these were historical plays, or histories; a species of dramatic writing which resembled the old mysteries in representing a series of historical events simply in the order of time in which they happened, without any regard to the three great unities. These pieces seem to differ from tragedy just as much as historical poems do from epic: as the *Pharsalia* does from the *Æneid*. What might contribute to make dramatic poetry take this turn was, that soon after the mysteries ceased to be exhibited, there was published a large collection of poetical narratives, called *the Mirror for Magistrates*, wherein a great number of the most eminent characters in English history are drawn relating their own misfortunes. This book was popular and of a dramatic cast; and therefore, as an elegant writer has well observed, might have its influence in producing historic plays. These narratives probably furnished the subjects, and the ancient mysteries suggested the plan.

That our old writers considered historical plays as somewhat distinct from tragedy and comedy, appears from numberless passages of their works. "Of late days (says Stow in his Survey of London), instead of those stage plays have been used comedies, tragedies, interludes, and histories, both true and fained." Beaumont and Fletcher, in the prologue to the *Captain*, say,

"This is nor comedy, nor tragedy,

"Nor history."—

Polonius in *Hamlet* commends the actors as the best in the world, either for tragedie, comedie, historie, pastorall, &c. And Shakespeare's friends, Heminge and Condell, in the first folio edition of his plays, in 1623, have not only intitled their book "Mr William Shakespeare's Comedies, Histories, and Tragedies," but, in their table of contents, have arranged them under those three several heads; placing in the class of histories, "King John, Richard II. Henry IV. 2 pts, Henry V. Henry VI. 3 pts, Richard III. and Henry VIII."

This distinction deserves the attention of the critics: for if it be the first canon or sound criticism to examine any work by those rules the author prescribed for his first ob-

servance; then we ought to try Shakespeare's histories by the general laws of tragedy and comedy. Whether the rule itself be vicious or not, is another inquiry; but certainly we ought to examine a work only by those principles according to which it was composed. This would save much impertinent criticism.

Not fewer than 19 playhouses had been opened before the year 1623, when Prynne published his *Hypocritastix*. From this writer we learn that tobacco, wine, and beer, were in those days the usual accommodations in the theatre, as now at Sadlers Wells. With regard to the ancient prices of admission, the playhouse called the *Hope* had five different priced seats, from sixpence to half-a-crown. Some houses had penny benches. The two-penny gallery is mentioned in the prologue to Beaumont and Fletcher's *Woman Hater*; and seats of threepence and a groat in the passage of Prynne last referred to. But the general price of what is now called the *Pit* seems to have been a shilling. The time of exhibition was early in the afternoon, their plays being generally acted by day light. All female parts were performed by men, no actresses being ever seen on the public stage before the civil wars. And as for the playhouse furniture and ornaments, they had no other scenes nor decorations of the stage, but only old tapeltry, and the stage strewd with rushes, with habits accordingly; as we are assured in a short Discourse on the English Stage, subjoined to Flecknoe's *Love's-Kingdom*, 1674, 12mo.

(B) For the state of the theatre during the time of Shakespeare, see PLAYHOUSE; where a full account of it is given from the late valuable edition of our illustrious poet's works by Mr Malone. During the whole reign of James I. the theatre was in great prosperity and reputation: dramatic authors abounded, and every year produced a number of new plays; it became a fashion for the nobility to celebrate their weddings, birth-days, and other occasions of rejoicing, with masques and interludes, which were exhibited with surprising expence; our great architect, Inigo Jones, being frequently employed to furnish decorations, with all the luxuriance of his invention and magnificence of his art. The king and his lords, and the queen and her ladies, frequently performed in these masques at court, and the nobility at their private houses; nor was any public entertainment thought complete without them. This taste for theatrical entertainments continued during great part of the reign of king Charles the first; but, in the year 1633, it began to be opposed by the Puritans from the press; and the troubles that soon after followed entirely suspended them till the restoration of king Charles the second in 1660.

The king, at his restoration, granted two patents, one to Henry Killigrew, Esq; and the other to Sir William Davenant, and their heirs and assigns, for forming two distinct companies of comedians. Killigrew's were called the *King's Servants*, and Davenant's the *Duke's Company*. About ten of the company called the *King's Servants* were on the royal household establishment, having each ten yards of scarlet cloth, with a proper quantity of lace allowed them for liveries; and in their warrants from the lord chamberlain they were styled *gentlemen of the great chamber*.

Till this time no woman had been seen upon the English stage, the characters of women having always been performed by boys, or young men of an effeminate aspect, which probably

(B) We have been anxious to give as full an account of the ancient English drama as we could: we must not omit, however, to inform our readers what Mr Malone says of the old plays, *viz.* that not one play published before 1502 will bear a second reading; and that exclusive of mysteries, moralities, and translations, there are but 34 pieces extant which were published before that period.

ably induced Shakespeare to make so few of his plays depend upon female characters, as they must have been performed to great disadvantage. The principal characters of his women are innocence and simplicity, such are Desdemona and Ophelia; and his specimen of fondness and virtue in Portia is very short. But the power of real and beautiful women was now added to the stage; and all the capital plays of Shakespeare, Fletcher, and Ben Jonson, were divided between the two companies, by their own alternate choice, and the approbation of the court.

The king's servants seem to have been allowed to be the best company; and when the variety of plays began to be exhausted, they drew the greater audiences. Dawenant, therefore, to make head against them, first added spectacle and music to action, and introduced a new species of plays, since called *tragic operas*; among these were, *The Tempist*, *Pjy-b*, and *Circe*; which, with many others, were set off with the most expensive decorations of scenes and habits, and with the best voices and dancers.

In 1684 the two houses united, and continued together for ten years. In 1690 the play began at four o'clock; and, we are told, the ladies of fashion used to take the evening air in Hyde-park after the representation; by which it appears that the exhibitions were in summer too. The principal actors were, Betterton, Montfort, Kynaston, Sandford, Nokes, Underhill, and Leigh, commonly called *Tony Leigh*; the actresses were, Mrs Betterton, Barry, Leigh, Butler, Montfort, and Bracegirdle; and to this company, in this year, old Cibber was admitted as a performer in the lowest rank. It was a rule with the patentees, that no young person, who offered himself as an actor, should be admitted into pay till after at least half a year's probation; and Cibber waited full three quarters of a year before he was taken into a salary of 10s. a-week.

In 1695 a new theatre was opened with Mr Congreve's comedy of *Love for Love*, which had such extraordinary success (says Cibber) that scarce any other play was acted there till the end of the season; but when the season ended, which appears to have begun in June, he does not tell us, and it is indeed difficult to guess; for though the company acted in summer, it seems improbable that they should shut up the house in winter, as it is difficult to conceive any reason for so doing. Congreve was then in such high reputation, that this company offered him a whole share (but into how many shares the whole was divided Coiley has not told us) upon condition he would give them a new play every year. This offer he accepted, and received the advantage, though he never fulfilled the condition; for it was three years before he produced the *Mourning Bride*, and three more before he gave them *the Way of the World*.

It is not necessary that we give in detail the remaining history of the English stage: those who are anxious to be acquainted with it may consult Cibber's history of the stage, continued by Victor, under the title of *A History of the Theatres of London and Dublin from the year 1730*. We shall only mention a few facts respecting the salaries of the players about that period, and the rise of the price of play-tickets.

A difference having arisen in 1733 between the managers and actors, most of the actors set up for themselves at the little theatre in the Haymarket. Upon this the managers published the following account of their salaries, to show the public how little room they had to mutiny. To Mr Colley Cibber, from the time of letting his share till he left the stage, 12l 12s. per week. Mr The. Cibber 5l. and his wife's whole salary till her death, without doing the company any service the greatest part of the winter; and his own also, during the time of his being ill, who per-

formed but seldom till after Christmas. Mr Mills jun. 3l. under the same circumstances with regard to his wife. Mr Mills sen. 1l. per day for 200 days certain, and a benefit clear of all charges. Mr Johnston 5l. Mr Miller 5l. paid him eight weeks before he acted, besides a present of 10 guineas. Mr Harper 4l. and a present of 10 guineas. Mr Griffin 4l. and a present. Mr Shepard 3l. Mr Hallam, for himself and father (though the latter is of little or no service) 3l. Mrs Heron 5l. raised from 40s. last winter, yet refused to play several parts assigned her, and acted but seldom this season. Mrs Butler 3l. per week. By these and other salaries, with the incident charges (besides clothes and scenes), the patentees are at the daily charge of 49l. odd money, each acting-day.

Till about the same time, the prices at the theatre were 4s. the boxes, 2s. 6d. the pit, 1s. 6d. the first gallery, and 1s. the second, except upon the first run of a new play or pantomime, when the boxes were 5s. the pit 3s. the first gallery 2s. and the second 1s. But Fleetwood thought fit to raise the prices for an old pantomime, which was revived without expence. This produced a riot for several nights, and at last a number deputed by the pit had an interview with the manager in the green room, where it was agreed, that the advanced prices should be constantly paid at the doors, and that such persons as did not choose to stay the entertainment should have the advanced part of their money returned. This was a very advantageous agreement for the manager; because, when the audience had once paid their money, and were seated, very few went out at the end of the play, and demanded their advanced money; the few that did it at first, soon grew tired, and at last it settled in the quiet payment of the advanced price, as at this day.

It has been frequently a subject of debate, whether the stage be favourable to morals. We do not mean to enter into the controversy; but we shall make an observation or two. It will be allowed by all, that the intention of the players in acting, is to procure money; and the intention of the audience in attending the theatre, is to seek amusement. The players then will only act such plays as they believe will answer their intention. And what sort of plays are these? They are such as correspond with the opinions, manners, and taste, of the audience. If the taste of the audience be gross, therefore the plays will be gross; if delicate and refined, they will be the same. And if we go back to the time of Shakespeare, we shall find that this has been uniformly the case. The conclusion, then, which we draw, is this, if the taste of the audience be pure, free from licentiousness, the plays will be the same, and the stage will be favourable to virtue.

THEBAIC POWDER. See *PHARMACY-Index*.

THEBAID, a celebrated heroic poem of Statius, the subject whereof is the civil war of Thebes, between the two brothers Eteocles and Polynices; or Thebes taken by Theseus.

THEBES, the name of a celebrated city of ancient Greece. It is supposed to have been built by Cadmus, about the year of the world 2555. This Cadmus, according to the Greeks, was the son of Agenor king of Sidon or Tyre; but the Sidonians allow him to have been of no higher quality than his cook, and tell us that his wife was a musician at court, with whom he ran away into Greece. The Greek writers tell us, that being commanded by his father to go in search of his daughter Europa, whom Jupiter in the shape of a bull had carried off, and forbid to return without her, he built, or rebuilt, the city of Thebes, after having long sought her in vain. He was at first opposed by the Hyantes and Aones; the former of whom he defeated in battle, and forced to retire into Locris: the

Thebes, the latter submitted, and were incorporated among his subjects.

Those who endeavour to extract some truth from the multitude of fables in which the early part of the Grecian history is obscured, are of opinion that Cadmus was one of the Canaanites expelled by Joshua; and that he was of the family of the Cadmonites mentioned by Moses and Joshua. He is universally allowed to have introduced the Phœnician letters into Greece, set up the first schools, and introduced brass; which, from him, had the name of *Cadmean* given to it. The government of Thebes continued for a long time monarchical; and the names of a number of its kings have been transmitted to us, with some account of their transactions; but so much obscured by fable, that little or nothing can be determined concerning them. We shall therefore pass over this fabulous part of their history, and only take notice of that period of it when the Thebans emerged from their obscurity, and for a time held the sovereignty of Greece.

Though the Thebans had been famed in the early period of their history for their martial achievements, yet in process of time they seem to have degenerated. At the time of the invasion of Xerxes, they were the first people in Greece who were gained over to the Persian interest. On account of this misbehaviour, they were become very obnoxious to the other states, especially to the Athenians, whose power and renown increased every day, and threatened at last to swallow them up altogether. The Thebans being in no condition to oppose such a formidable power, put themselves under the protection of the Spartans, who, out of jealousy of the Athenians, readily forgave them; and so grateful were the Thebans for the kindness shown them at this time, that during the whole of the Peloponnesian war Sparta had not a more faithful ally. By these means they not only recovered the government of Bœotia, of which they had been formerly in possession, till deprived of it on account of their siding with the Persians, but their city became one of the first in Greece. By this prosperity the Thebans were so much elated, that, when the peace of Antalcidas came to be signed, they refused to agree to it, as they were thus once more deprived of the government of Bœotia; so that it was not without the utmost difficulty that they were overawed into it by the other states. Not content with forcing them to give up this point, however, the Spartans undertook to change the form of the Theban government, which at this time was a democracy, and accomplished through the treachery of those who had the care of the citadel.

The Thebans continued under the power of the Spartans for four years; at the end of which term a conspiracy being formed against them by some of the principal people in the city, among whom was a young nobleman named *Pelopidas*, the Spartans were massacred and driven out, and the citadel regained. During the tumult *Epaminondas*, afterwards the celebrated general, with a number of the best citizens, joined the party of *Pelopidas*; and the latter having called a general assembly of the Thebans, proclaimed liberty to them, and exhorted them in the strongest manner to fight for their country. This speech was received with the greatest acclamations; *Pelopidas* was unanimously proclaimed the preserver of Thebes, and was charged with the management of the war which was then to be declared against Sparta.

These transactions so much exasperated the Spartans, that they immediately sent their king *Cleombrotus* against them, though it was then the depth of winter. The Athenians, in the mean time, who had hitherto assisted the Thebans, declined any farther connection, lest they should draw upon themselves the resentment of the Spartans. But

they were soon after determined to act again on the same side, by an attempt which the Spartan general, *Sphodrias*, had rashly made on the *Pyraeum* or harbour of Athens. Thus, by means of the Athenians, a powerful diversion was made in favour of the Thebans, who gradually recovered all the towns of Bœotia, and at length began to act offensively against their enemies, and made a powerful invasion in Phocis. They had now many sharp encounters with them; which, though they did not amount to decisive battles, yet did not fail to raise their courage, and distress that of the Spartans. In these encounters *Pelopidas* always signalized himself; and in the battle of *Tanagra*, where the Lacedæmonians were entirely defeated by the Athenians and their allies, *Pelopidas* had a principal share in the victory, and killed the Spartan general with his own hand. Soon after this, with a body of only 300 Thebans, he entirely routed and dispersed near 1000 Spartans; which was the greatest disgrace the latter had ever known; for till that time, whether in war with the Greeks or Barbarians, they had never been overcome by an equal, much less by such an inferior, number of troops.

These successes of the Thebans greatly alarmed the Athenians, who continually fought to oppose their growing power. In this opposition they were joined by the *Plataeans*, who on this account became extremely obnoxious to the Thebans, so that they at last came to a resolution to surprize their city. This they accomplished, and entirely destroyed it, together with *Thespia*, another city extremely well affected to Athens. Soon after this, the Thebans, encouraged by their success, began to think of enlarging their territories, and of making encroachments on their neighbours, as they saw other states had done before them. This spirit of conquest is said to have been raised by their general *Pelopidas*; in which he was seconded by *Epaminondas*, a person who, though like him endowed with all the necessary qualities to make a complete captain or patriot, had till then preferred a private life, and lived in a constant course of virtue and the study of philosophy. He had as yet seldom appeared in public, except to get himself excused from those state-employments which were so eagerly courted by others. This, however, had not hindered him from contracting an intimate friendship with *Pelopidas*, which had been daily improved by the correspondence of their tempers and principles, as well as by that zeal which both displayed for the good of their country; which last had made them, even before this time, appear together in action, and to such advantage, that *Epaminondas's* merit could be no longer concealed, nor indeed suffer him to continue longer in his beloved retirement: so that he saw himself, at length, deservedly placed at the head of the Theban troops; where he gave such early proofs of his future prowess and abilities, as justly gave him the next rank to *Pelopidas*. Both came now to be considered in the same light, as generals in the field, as governors at home, and as complete statesmen in the council. When the general treaty for restoring peace to Greece came to be proposed by the Athenians, and was upon the point of being executed by the rest of the states, the Thebans refused to agree to it, unless they were comprehended in it under the name of *Bœotians*. This demand was as strenuously opposed by the other contracting powers as insisted on by *Epaminondas*, who was there as ambassador on the part of the Thebans. *Agésilas*, in particular, told him in plain terms, that the Thebans ought to evacuate Bœotia and leave the cities of it free and independent. To which he was answered by him, that the Lacedæmonians would do well to set them the example, by restoring Messenia to its ancient proprietors, and Laconia to its ancient freedom; for

2 supposed to be one of the exiled Canaanites.

10 Account of Epaminondas.
11 His difference with Agésilas king of Sparta.

¹¹ *Thebes* that the pretensions of the city of *Thebes* to *Bœotia* were as well founded, at least, as those of *Sparta* to these two countries. After this he went on, and showed how far *Sparta* had aggrandized herself at the expence of her neighbours: that peace might be indeed obtained, and upon a solid and lasting footing; but that this could not be otherwise than by bringing all to an equality. This bold, though just remonstrance, in which not only *Thebes*, but Greece in general was concerned, failed not, however, to exasperate the haughty Spartan monarch; and the Athenians, who had till now looked upon the *Thebans* as dependents either on them or on the *Macedonians*, were not a little offended to hear their ambassadors talk in such high terms. The result of the conference was, that *Agæsilas* struck the name of *Thebes* out of the treaty, and declared war against them, about the year 371 B. C.

¹² The Spartans declare war against *Thebes*.
The *Thebans* were in no small consternation to see themselves engaged in a war with the powerful Spartans, without any ally to assist them; and the rest of the Grecian states having made peace with the latter, began to look upon the ruin of the former as unavoidable. However, they resolved to make the best defence they could; and put their army under the command of *Epaminondas*, assigning him, at his own request, six others to act as counsellors or assistants. The *Theban* army consisted at most but of 6000 men, whereas that of the enemy was at least thrice that number; but *Epaminondas* trusted most to his horse, wherein he had much the advantage both in quality and good management: the rest he endeavoured to supply by the disposition of his men, and the vigour of the attack. He even refused to suffer any to serve under him in the engagement, but such as he knew to be fully resolved to conquer or die. The two armies met at *LEUCTRA*, where the Spartans were defeated with great slaughter, as related under that article.

¹³ Are entirely defeated at *Leuctra*.
The victorious general, desirous to improve this great victory, sent an herald, crowned with garlands, to communicate it in form to the Athenians, in hopes that this would be an effectual means to reunite them to the *Theban* interest. But it proved quite otherwise. Athens, which now looked upon them with a jealous eye, and had then in view the sovereignty of Greece, chose rather, if they could not wholly obtain it, to share it with *Sparta*, than to let the *Thebans* into the whole; and therefore even declined giving their herald audience. However, the *Thebans* took care to strengthen themselves by alliances; and, besides the *Arcadians* and *Eleans*, had got the *Phocians*, *Locrians*, *Arcarnanians*, *Eubœans*, and other states, under their dependence: so that they were now in a condition to act offensively against the Spartans. Accordingly, under pretence of assisting the *Arcadians*, they entered *Peloponnesus* with a gallant army, with *Epaminondas* and *Pelopidas* at their head. Here they were joined by the *Arcadian* and other confederate forces; so that the whole amounted to 40,000, some say 50,000 men, besides great numbers of those who followed the camp, rather for plunder than fighting, and were computed about 20,000 more. The army was divided into four columns, and moved straight towards *Sellasia*, the place of their rendezvous, from which they pursued their journey with fire and sword towards *Sparta*. But here they were repulsed by *Agæsilas*, who was then returned to that metropolis.

To repair, in some measure, this disgrace, and at the same time to leave some lasting monument which should redound as much to his glory as to the mortification of the Spartans, *Epaminondas* left not their territories till he had restored the posterity of the old *Messenians* to their ancient dominions, out of which they had been banished near 300

years; rebuilt their capital, and left a strong garrison for its defence. He was, however, like to have been stopped in his return by *Iphicrates*, whom the Athenians had sent with 12,000 men to intercept him; but this last loitered so long at *Corinth*, that the *Thebans* had passed the defiles of *Cenchræ*, the chief place where he could have obstructed his retreat had he taken possession of it in proper time. *Epaminondas* continued his march till he came in full view of the city of *Corinth*. He found the roads choked up with trees, rocks, stones, and every thing that could render them impassable; and the *Corinthians* well fortified, and resolute on a stout defence. But he came so seriously upon them, notwithstanding all these difficulties, that they abandoned all their entrenchments and outworks to the *Thebans*, and fled into the city. Thither these pursued them sword in hand, and made an horrid slaughter of them; in so much that *Corinth* must have unavoidably fallen into their hands, had their generals thought fit to pursue these advantages; but whether they were afraid of the Athenians falling upon them, or apprehended some dangerous ambush in a country with which they were but indifferently acquainted, or whether the army was too much weakened through so many fatigues, or lastly, whether the coldness of the season, it being then the depth of winter, would not permit them to proceed farther, they immediately marched towards *Bœotia*. This gave such an handle to their enemies, that they met with a very mortifying reception at their return to *Thebes*, where they were both arrested, and clapped up as state-prisoners, for having presumed to prolong their command four months longer than the time limited by law, which time took in almost the whole of their expedition from their first entrance into *Peloponnesus*. However, at last, the judges being ashamed to proceed any farther, they were both honourably acquitted.

This prosecution had been chiefly carried on and encouraged by *Meneclides*, a discontented *Theban*, and a bold and able speaker, who, by his artful calumnies at the trial, had so far prevailed with the judges as to get *Epaminondas* deprived of the government of *Bœotia* for a whole year, though he could not gain the same advantage against *Pelopidas*, who was a greater favourite of the people, as being his senior.

¹⁴ By this delay the Spartans, with much difficulty, had recovered themselves from their great defeat at *Leuctra*, and settled their affairs in as good a posture as they could: but though they had repulsed the *Thebans* in *Peloponnesus*, yet from the exploits they had performed there, especially in the dismembering the whole kingdom of *Messenia* from them, they had still cause to fear what their forces might do under two such generals; and had accordingly taken due care to strengthen themselves against them, and to provide themselves with a great number of auxiliaries from other states, especially from that of Athens, with whom they had renewed their old treaty, and had a creed that each should have the command five days alternately. Soon after this treaty the *Arcadians* renewed the war, and took *Pallene* in *Laconia* by storm, put the garrison to the sword, and were presently assisted by the *Argives* and *Eleans*, and especially by the *Thebans*, who sent to them 7000 foot and 500 horse under the command of *Epaminondas*. This so alarmed the Athenians likewise, that they immediately sent *Gobrias* with some forces to oppose his passage in good earnest; and he so behaved himself against the *Thebans*, that they were forced to abandon *Peloponnesus* a second time. This ill-success gave fresh occasion to the enemies of *Epaminondas* to blame his conduct in the highest terms, notwithstanding the singular bravery with which he and his troops had forced the pass. Even his friends could not but suspect him

Thebes. of partiality for the Spartans, in not pursuing his advantage over them, and making a greater slaughter of them when he had it in his power; whilst his enemies made it amount to no less than treachery to his country: so that their brave general was once more deprived of the government of Bœotia, and reduced to the condition of a private man. He did not continue long under this disgrace, before an occasion offered to make his services again of such necessity to the state, as to give him an opportunity to retrieve his fame, and wipe off the stain which his enemies had thrown upon him.

23 Epaminon- das degra- ded. The Thessalians, who had groaned some time under the tyranny of the usurper Alexander, furnished the *Phœæans*, sent an embassy to Thebes to implore their aid and protection; upon which Pelopidas was immediately sent as ambassador to expostulate with him on their behalf. He was then in Macedon, from whence he took the young prince Philip, afterwards the celebrated monarch, in order to protect and educate him; and, upon his return, marched directly to Phartalus in Thessaly, in order to punish the treachery of some mercenaries, who had deserted the Thebans in that expedition; but when he came thither, he was surprised to be met by the tyrant at the head of a numerous army before that city, whilst his own was but as a handful of men in comparison of it. However, whether he suspected, or would be thought to do so, that Alexander came thither to justify himself, and answer to the complaints alleged against him, he went, with Ismenias his colleague, to him unarmed and unattended, not doubting but his character as ambassador from so powerful a republic, joined to his own character and authority, would protect them from insult or violence: but he found himself mistaken; for Alexander had no sooner got them in his hands, than he caused them to be seized, and sent prisoners to Phœæ.

24 Pelopidas seized by Alexander of Phœææ. The Thebans, highly resenting the indignity offered to their ambassadors, sent immediately an army into Thessaly: but the generals were repulsed with great loss by the Phœæan usurper; and it was owing to Epaminondas, who was among them only as a private sentinel, that they were not totally cut off. For the Thebans, finding themselves in such imminent danger, which they attributed to the incapacity of their generals, had immediately recourse to him, whose valour and experience had been so often tried; and, partly by persuasions and intreaties, and partly by threats, obliged him to take the command. This soon gave a different turn to their affairs, and converted their flight into a safe and regular retreat; for he took the horse and light-armed foot, and placed himself at their head in the rear, and charged the enemy with such vigour and bravery, that he obliged them to desist from their pursuit.

25 A Theban army sent to rescue him, defeated. However, as the army had suffered such loss before as not to be able to pursue them in their turn, he was obliged to return with them to Thebes, with their pusillanimous generals; where the latter were fined 12,000 drachms each, and the former was reinstated in the command, and sent with a new reinforcement to repair the late dishonour, and prosecute their revenge. The news of his being in full march on this errand greatly alarmed the tyrant; but Epaminondas, preferring the safety of his imprisoned colleague to all other considerations, forbore pushing hostilities to extremes, for fear of provoking the enemy to wreak all his fury on him: to prevent which, he contented himself for a while hovering about with his army, and now and then with such slight skirmishes as should intimidate the tyrant, and bring him the sooner to make some satisfactory offers. Alexander being fully convinced of the superiority of the Theban general, was glad to accept of a truce of 30 days, and to restore Pelopidas and Ismenias to him; upon which he

immediately withdrew his forces, and returned with them to Thebes.

By this time Thebes was raised to a sufficient height of reputation and glory to begin to aim in earnest at the sovereignty of Greece. The main obstacle to it was, that the other states grew so jealous of her present greatness, as to enter into the strongest alliances and confederacies to prevent its farther growth; so that not being able now to procure many allies at home, they made no difficulty to seek for them abroad; and the Lacedæmonians, by leading the van, gave them a plausible pretence to follow their steps, and to procure an alliance with Persia, which at that time they found was ready to accept of the offers on any terms; the only question was, which of the three states should be preferred, Sparta, Athens, or Thebes. At the same time, the Thebans proposed to their new confederates to send likewise proper deputies to the Persian court, in order to support their respective interests; which they readily agreed to. These were the Arcadians, Eleans, and Argives; at the head of whose deputation Pelopidas was sent on the behalf of the Thebans; which the Athenians being apprised of, appointed two on their part. These being all arrived at the Persian court, began to pursue each their respective interests; but Pelopidas had by that time gained such credit there, both for his singular address and his extraordinary exploits, that he was distinguished in a particular manner from all the other deputies, and was received by the king with the most manifest marks of honour and esteem, who freely owned himself convinced that the Thebans were the people on whom he could most safely depend; and after having greatly applauded the equity of his demands, ratified and confirmed them with great readiness, to the no small mortification of the other states. The substance of them was, that the liberties formerly granted to the other towns of Greece should be confirmed; that Messenia, in particular, should continue free and independent on the jurisdiction of Sparta; that the Athenians should lay up their fleet; and that the Thebans should be looked upon as the ancient and hereditary friends of Persia.

The Thebans took advantage of the dissensions which prevailed among the Greeks as a pretence for increasing their forces; and Epaminondas thought it a proper opportunity for his countrymen to make a bold effort to obtain the dominion at sea, as they had obtained it in a great measure at land. He proposed it to them in a public assembly, and encouraged their hopes from the experience of the Lacedæmonians, who in Xerxes's time had, with ten ships only at sea, gained the superiority over the Athenians, who had no fewer than 200; and added, that it would be a disgrace now to Thebes to suffer two such republics to engross the empire of so extensive an element, without putting in at least for their share of it. The people readily came into his proposal, not without extraordinary applause, and immediately ordered 100 galleys to be equipped; and in the meanwhile sent him to Rhodes, Chios, and Byzantium, to secure those states in their interest, and get what assistance he could from them. His negotiations had all the success that could be wished for, notwithstanding the strenuous opposition of the Athenians, and of their admiral Laches, who was sent with a powerful squadron against him. But what more effectually thwarted all his measures, was the work that they found for him at land, and the obliging the Thebans to take part in the quarrels that then reigned among their neighbours: so that whatever projects they had concerted, proved abortive for the present; and the death of Epaminondas, which happened not long after, put an effectual stop to them.

During the absence of that general, and of his colleague

Thebes.

23 success of Pelopidas at the Persian court.

26 The Thebans propose to build a fleet.

Thebes. Pelopidas, the Orchemenians, being spirited up by some Theban fugitives, had formed a design to change the Theban government into an aristocracy; and 300 horsemen of the former had been actually sent to put it in execution. Their project, however, was timely discovered by the vigilance of the magistrates, who caused them to be seized, and

³⁰ The city of Orchomenos razed.

put immediately to death. They next sent a sufficient force against the city of Orchomenos, with orders to put all the men to death, and to sell the women and children for slaves, which was punctually done; after which they razed that noble city to the ground. Pelopidas was then on his way to Thessaly, at the head of a powerful army, whither he had been sent to assist the Thessalians, who still groaned under the tyranny of Alexander the Phœnian, and had made several brave efforts to recover their liberty, but had been still overpowered by that usurper. Being joined by the Thessalians, he encamped in the face of the enemy, though far superior in number, and consisting of above 20,000 men. A fierce engagement soon ensued, in which both sides fought with uncommon bravery. The place where the battle was fought was called *Cynorophala*, from several little hills on it, between which there ran a large plain. Both sides endeavoured at first to post themselves on these eminences with their foot, whilst Pelopidas ordered his cavalry to charge that of the enemy below; which they did with such success, that they soon put them to the rout, and pursued them over the plain. This obliged the tyrant to gain the tops of the hills, where he greatly annoyed the Thessalians that endeavoured to force those ascents; so that Pelopidas was obliged to give over his pursuit to come to their relief. This immediately inspired the Thessalians with fresh courage, who began a gain to charge the enemy at several onsets; and soon threw them into such disorder, that they were forced to give way. Pelopidas no sooner perceived the advantage, than he began to look about for Alexander, with a design of engaging him. Having found him out as he was commanding his right wing, and endeavouring to rally his men, he moved directly to him; and being got near enough to be heard by him, challenged him to decide the battle by single combat with him. Alexander, instead of accepting the offer, turned about, and with all the speed he could ran to screen himself amongst his guards. Upon this Pelopidas charged him with such furious speed, that he obliged him to retire farther, and shelter himself within the thickest ranks; the sight of which made him attack with fresh vigour, and fight more desperately against him. He tried in vain several times to break through their ranks to reach him, cutting down great numbers of those that came forward to oppose him: his eagerness at length exposed him so far to the darts that were shot at him at a distance, that some of them went quite through his armour, and gave him a desperate wound or two, while the rest advanced and stabbed him in the breast with their spears.

³¹ Pelopidas marches against the Thessalian tyrant.

It is scarce possible for words to express the grief and despair which not only his brave Thebans, but likewise the Thessalians and other allies, showed at the sight of their main general: some of the latter, who had perceived the danger he was exposed to, came down the hill with all possible speed to his relief; but when they perceived that they were come too late to save him, both they and the rest of the little army thought on nothing now but to revenge his death. They rallied accordingly, both horse and foot, as quick as possible, and began to charge the enemy afresh, and with such desperate fury, that they at length gained a complete victory over them, and killed above 3000 of them in their pursuit, besides a much greater number which they had slain on the field of battle, though they still looked up

³² He killed.

³³ Alexander retreated.

on all these advantages as vastly too small to compensate the loss of their brave general.

The news of his death had no sooner reached Thebes, than the whole city was seen in as deep a mourning as his army. However, they sent a reinforcement to it of 7000 foot and 700 horse, as well to revenge the death of that general, as to improve the victory he had gained over the enemy; by the help of which they fell so furiously on them, that they quickly broke and totally defeated the shattered remains of Alexander's army. Hereupon he was forced to sue for peace, and to accept it on such conditions as the conquerors thought fit to impose. He was at length dispatched in his bed by his wife Thebe, assisted by her brothers, about seven years after his defeat. His body was afterwards dragged along the streets, trodden under foot, and left a prey to the dogs.

³⁴ And at last murdered.

All this while the Thebans were watching to improve every commotion that happened, every success they met with, to the forwarding of their then reigning and favourite project, of increasing their power above all the rest, and in their turn to give laws to Greece. Their late success in Thessaly, and the rupture between the Arcadians and Mantineans at the same time, about some consecrated money which the former had taken out of the temple of Olympias to pay their troops employed against the Eleans, and which the latter called a downright sacrilege, besides other discords that reigned in the other states of Greece, gave fresh encouragement to Thebes to set up for arbiters in those disputes; and so much the more, as those who had embezzled the sacred money, and wanted rather to embroil matters than to have them brought to light, sent that republic word that the Arcadians were just upon the point of revolting to the Spartans, and advised them to come and put an immediate stop to it. At the same time they dispatched some private directions to a Theban officer at Tegea, to apprehend several of their own people as disturbers of the peace. This was accordingly done, and several eminent persons were confined as prisoners of state: they were soon after discharged, and loud complaints were made against such arbitrary and unjust proceedings. The officer was accused before the Theban senate for having intermeddled in their affairs, and endeavoured to interrupt the good correspondence between the two states. It was even insisted on by some of the Tegeans, that he should be indicted and proceeded against by his principals; whilst the more moderate sort, who foresaw the consequences that were likely to attend such appeals, and that it would infallibly bring the Thebans upon them, loudly protested against their marching into their territories, and did all they could to prevent it. The Thebans, however, were become too powerful and ambitious to miss so fair an opportunity of getting once more footing in Peloponnesus, as they had long ago premeditated; and Epaminondas was so far from making a secret of their design, that he told the Arcadian deputies in justification of it, that as it was on their account that the Thebans engaged in the war, they had acted treacherously with them in making peace with Athens without their consent: however, that when he was got with his army on his march into Peloponnesus to assist his friends, he would soon see what proofs the Arcadians would give of their fidelity. This speech did not fail to alarm them greatly; especially as it was spoken in such a magisterial style and threatening tone. Even those who were best affected to the Thebans could not forbear expressing their dislike of it; and all that had the welfare of Peloponnesus at heart readily agreed with the Mantineans, that there was no time to be lost to use all proper means to prevent the impending storm.

³⁵ Ambition of the Thebans.

³⁶ Epaminondas disputes the states of Greece.

Athens

Athens and Sparta were accordingly applied to, and were easily prevailed upon to assist the Mantineans, and to come into a strict confederacy against the Thebans; and to prevent all disputes about the command of the army, it was agreed that each state should have it in its own territories; which plainly shows how terrified they all were at the apprehension of a fresh invasion of the Thebans: for this was a point which neither the Spartans nor Athenians would have so readily given up to the Arcadians, though these had formerly as strenuously insisted upon it, even when they were almost reduced to the last extremity, and had never been able to obtain it till now. But Epaminondas was then in full march at the head of his Egeotian troops, with some Eubœan auxiliaries, and a body of stout Theffalian horse; and was moreover to be joined by the Messenians, Argives, and several other nations, as soon as he had entered Peloponnesus. The confederate army against him had ordered their rendezvous at Mantinea, the place which they naturally concluded would be first attacked, as being the chief seat of those who had revolted from the Thebans. But whilst they were securing themselves on that side, Epaminondas, who wisely considered how far this confederacy and expedition must have drained the city of Sparta of its main strength, broke up privately from Nemœa, where he had lain for some time encamped, and marched all that night with a design to have surpris'd that important capital: but his project being timely discovered, the vigilant king took care to disconcert it; so that, though the Theban general made several vigorous assaults on that city, he was so stoutly repulsed, and the Spartans behaved with such intrepid valour, that he was forced to retire and turn his thoughts against Mantinea, which he judged by this time to have been quite defenceless. He judged rightly indeed; for the place was not only drained of its troops, but likewise of its inhabitants, who took that opportunity, whilst the scene of war was in Lacedæmon, to gather in their harvest, and were scattered all over the country; so that he would not have met with any difficulty in gaining the town, had not the Athenian auxiliaries come unexpectedly to its relief, and given him a fresh repulse.

These two last defeats greatly exasperated the Theban general, who had never till now been used to them, and could not but foresee that they would not only lessen his reputation with his allies, but, if not timely retrieved, would fully the glory of all his former exploits. What added to his present difficulties was, that the time allotted him for his expedition was almost expired; so that he had but a short space left to undertake some brave achievement, which might recover his and his country's honour, and keep up the spirits of his auxiliaries and those under his protection. He was moreover got very far into the enemy's country, and saw plainly enough how narrowly they watched all his motions, and how well prepared they were to oppose him whatever attempt he resolv'd upon, whether to attack them or to retreat. Under all these difficulties, he rightly considered, that he must immediately resolve upon a decisive battle; in which, if his private fortune followed him, he might at once retrieve his affairs, and make himself master of Peloponnesus; or, if that failed him, as it lately had done, fall honourably in the attempt. In this engagement Epaminondas made the wisest disposition of his troops, attacked and fought with the most intrepid courage and conduct, and had opened himself a way through the Spartan phalanxes, thrown them into the utmost confusion, and made a terrible slaughter of them, insomuch that the field of battle was covered with their wounded and slain, when, in the heat of the fight, having ventured himself too far in order to give them a total overthrow, the enemy rallied again, pour-

ing with their whole fury three volleys of darts at him, some of which he drew out and returned to them, till at length, being covered with wounds, and weakened with the loss of so much blood, he received a mortal wound from a javelin, and was with great difficulty rescued from the enemy by his brave Thebans, and brought alive, though speechless, into his tent. As soon as he had recovered himself he asked his friends that were about him what was become of his shield; and being told that it was safe, he beckoned to have it brought to him, and kissed it. He next inquired which side had gained the victory; and being answered, The Thebans; he replied, Then all is well: and upon observing some of his friends bewail his untimely death, and leaving no children behind him, he is said to have answered, Yes; I have left two fair daughters, the victory of Leuctra, and this of Mantinea, to perpetuate my memory. Soon after this, upon drawing the point of the javelin out of his body, he expired.

The consequence of this great general's fall, and of this bloody fight, in which neither side could boast any great advantage over the other, but a great loss of men on both sides, insomuch that Xenophon makes it a drawn battle, was, that both parties agreed on a cessation of arms, and parted, as it were by consent, to take care of their wounded and slain. The Thebans indeed thus far gain'd the greater share of glory, that they renewed the fight, and after a most desperate contest, gained the victory over those Spartans that oppos'd them, and rescued the body of their dying general out of their hands. However, an effectual end was put to this bloody war, and a general peace agreed on by all but Sparta; who refused it only because the Messenians were included in it. But as to the Thebans, they had no great reason to boast of this dear-bought victory, since their power and glory began to decline from that very time; so that it may be truly said, that it rose and set with their great general.

On the death of Epaminondas, the Thebans relapsed into their former state of inactivity and indolence; and at last having ventured to oppose Alexander the Great, their city was taken, and the inhabitants slaughtered for several hours, after which the buildings were destroyed. It was rebuilt by Cassander, but never afterwards made any considerable figure among the states of Greece. About the year 146 B. C. it fell under the power of the Romans, under which it continued till the extinction of their empire by the Turks. It is now called *Thive*, and is nothing to what it was formerly; yet it is four miles in circumference, but so full of ruins; that there are not above 4000 Turks and Christians in it. It is now famous for a fine sort of white clay, of which they make bowls for pipes after the Turkish fashion. They are never burnt, but dry naturally, and become as hard as a stone. There are two mosques in Thebes, and a great many Greek churches. It is seated between two small rivers, in E. Long. 23. 40. N. Lat. 38. 17.

THEBES, in Egypt, one of the most renowned cities of the ancient world. It was also called *Diopolis*, or the city of Jupiter, and was built, according to some, by Osiris, according to others by Busiris. Its length, in Strabo's time, was 80 furlongs, or ten miles; but this was nothing in comparison of its ancient extent, before it was ruined by Cambyses, which, we are told, was no less than 420 stadia, or 52 miles and an half. The wealth of this city was so great, that, after it had been plundered by the Persians, what was found, on burning the remains of the pillage, amounted to above 300 talents of gold and 2300 of silver.

Mr Bruce visited the ruins of this celebrated city; but informs us that nothing now remains except four temples, and these neither so entire nor magnificent as some others at

Thebes,
Thebes.

a place called *Dendera*. Thebes has been celebrated by Homer for its hundred gates; but Mr Bruce informs us, that no vestiges of these are now remaining, neither can we discover the foundation of any wall it ever had; "and as for the horsemen and chariots it is said to have sent out, all the Thebaid sown with wheat would not have maintained one half of them." Thebes at least the ruins of the temples called *Medinet Tabu*, are built in a long stretch of about a mile broad, most parsimoniously chosen at the sandy foot of the mountains. The *Horti Pensiles*, or hanging gardens, were surely formed upon the sides of these hills, then supplied with water with mechanical devices. The utmost is done to spare the plain, and with great reason; for all the space of ground this ancient city has had to maintain its myriads of horses and men, is a plain of three quarters of a mile broad between the town and the river, upon which plain the water rises to the height of four and five feet. All this pretended populousness of ancient Thebes I therefore believe to be fabulous."

From's
towards.

Mr Bruce, after examining the ground on which Thebes is supposed to have stood, thinks that it had no walls, and that consequently Homer's story of its having an hundred gates is misunderstood. The mountains of the Thebaid stand close behind the town, not in a ridge, but standing single, so that you can go round each of them. A hundred of these are said to be hollowed out for sepulchres and other purposes. These, he thinks, were the hundred gates of Homer; in proof of this they are still called by the natives *Beban el Meluke*, "the ports or gates of the kings."

All that is said of Thebes by poets or historians after the days of Homer is meant of Diopolis, which was built by the Greeks long after Thebes was destroyed, as its name testifies; though Diodorus says it was built by Busiris. It was on the east side of the Nile, whereas ancient Thebes was on the west, though both are considered as one city; and Strabo says, that the river runs through the middle of Thebes, by which he means between Old Thebes and Diopolis.

THEFT, or **SIMPLE LARCENY**, is "the felonious taking and carrying away of the personal goods of another." This offence certainly commenced then, whenever it was that the bounds of property, or laws of *meum* and *tuum*, were established. How far such an offence can exist in a state of nature, where all things are held to be common, is a question that may be solved with very little difficulty. The disturbance of any individual in the occupation of what he has seized to his present use, seems to be the only offence of this kind incident to such a state. But, unquestionably, in social communities, when property is established, any violation of that property is subject to be punished by the laws of society; though how far that punishment should extend is matter of considerable doubt.

By the Jewish law it was only punished with a pecuniary fine, and satisfaction to the party injured; and in the civil law, till some very late constitutions, we never find the punishment capital. The laws of Draco at Athens punished it with death: but his laws were said to be written with blood; and Solon afterwards changed the penalty to a pecuniary mulct. And to the Attic laws in general continued; except that once, in a time of dearth, it was made capital to break into a garden and steal figs: but this law, and the informers against the offence, grew so odious, that from them all malicious informers were styled *ycophants*; a name which we have much perverted from its original meaning. From these examples, as well as the reason of the thing, many learned and scrupulous men have questioned the propriety, if not lawfulness, of inflicting capital punishment for simple theft. And certainly the natural punishment for injuries to

property seems to be the loss of the offender's own property; which ought to be universally the case, were all men's fortunes equal. But as those who have no property themselves are generally the most ready to attack the property of others, it has been found necessary, instead of a pecuniary, to substitute a corporal punishment; yet how far this corporal punishment ought to extend, is what has occasioned the doubt. Sir Thomas More and the Marquis Beccaria, at the distance of more than two centuries, have very sensibly proposed that kind of corporal punishment which approaches the nearest to a pecuniary satisfaction, viz. a temporary imprisonment, with an obligation to labour, first for the party robbed, and afterwards for the public, in works of the most slavish kind; in order to oblige the offender to repair, by his industry and diligence, the depredations he has committed upon private property and public order. But, notwithstanding all the remonstrances of speculative politicians and moralists, the punishment of theft still continues throughout the greater part of Europe to be capital: and Puffendorf, together with Sir Matthew Hale, are of opinion that this must always be referred to the prudence of the legislature; who are to judge, say they, when crimes are become so enormous as to require such sanguinary restrictions. Yet both these writers agree, that such punishment should be cautiously inflicted, and never without the utmost necessity.

The Anglo-Saxon laws nominally punished theft with death, it above the value of twelvecence; but the criminal was permitted to redeem his life by a pecuniary ransom; as, among their ancestors the Germans, by a stated number of cattle. But in the 9th year of Henry I. this power of redemption was taken away, and all persons guilty of larceny above the value of twelvecence were directed to be hanged; which law continues in force to this day. For though the inferior species of the t. or petit larceny, is only punished by whipping at common law, or (by stat. 4 Geo. I. c. 11.) may be extended to transportation for seven years, as is also expressly directed in the case of the Plate-glass Company; yet the punishment of grand larceny, or the stealing above the value of twelvecence (which sum was the standard in the time of king Athelstan, 800 years ago), is at common law regularly death: which, considering the great intermediate alteration in the price or denomination of money, is undoubtedly a very rigorous constitution; and made Sir Henry Spelman (above a century since, when money was at twice its present rate) complain that while every thing else was risen in its nominal value, and become dearer, the life of man had continually grown cheaper. It is true, that the mercy of juries will often make them strain a point, and bring in larceny to be under the value of twelvecence, when it is really of much greater value: but this, though evidently justifiable and proper when it only reduces the present nominal value of money to the ancient standard, is otherwise a kind of pious perjury, and does not at all excuse our common law in this respect from the imputation of severity, but rather strongly confesses the charge. It is likewise true, that by the merciful extensions of the benefit of clergy by our modern statute-law, a person who commits a simple larceny to the value of thirteen pence or thirteen hundred punds, though guilty of a capital offence, shall be excused the pains of death; but this is only for the first offence. And in many cases of simple larceny the benefit of clergy is taken away by statute: as from horse-stealing in the principals and accessories both before and after the fact; theft by great and notorious thieves in Northumberland and Cumberland; taking woollen cloth from off the tenters, or linens, fustians, calicoes, or cotton goods, from the place of manufacture (which extends, in the last case, to aiders, as-

sisters,

lifers, procurers, buyers, and receivers); feloniously driving away, or otherwise stealing one or more sheep or other cattle (specified in the acts, or killing them with intent to steal the whole or any part of the carcase, or aiding or assisting therein; thefts on navigable rivers above the value of forty shillings, or being present, aiding and assisting thereat; plundering vessels in distress, or that have suffered shipwreck; stealing letters sent by the post; and also stealing deer, hares, and conies, under the peculiar circumstances mentioned in the Waltham black act. Which additional severity is owing to the great malice and mischief of the theft in some of these instances; and, in others, to the difficulties men would otherwise lie under to preserve those goods, which are so easily carried off. Upon which last principle the Roman law punished more severely than other thieves the *Abigei* or stealers of cattle, and the *Balnearii* or such as stole the clothes of persons who were washing in the public baths; both which constitutions seem to be borrowed from the laws of Athens. And, so too, the ancient Goths punished with unrelenting severity thefts of cattle, or of corn that was reaped and left in the field: such kind of property (which no human industry can sufficiently guard) being esteemed under the peculiar custody of heaven.

THEFT-BoTE (from the Saxon *theof*, i. e. *fur*, and *bote*, *compensatis*), is the receiving of a man's goods again from a thief, after stolen, or other amends not to prosecute the felon, and to the intent the thief may escape; which is an offence punishable with fine and imprisonment, &c.

THELIGONUM, in botany: A genus of plants belonging to the class of *monœcia*, and order of *polyandria*; and in the natural system ranging under the 53d order, *Scabride*. The male calyx is bifid; there is no corolla; the stamina are generally 12. The female calyx is also bifid; there is no corolla; only one pistil; the capsule is coriaceous, unilocular, and monospermous. There is only one species, the *Cynocrambe*, which is indigenous in the south of Europe.

THEME, denotes the subject of an exercise for young students to write or compose on.

THEMISON, a physician of Laodicea, a disciple of Asclepiades. He founded the methodic sect, with a view to the more easily teaching and practising the art of medicine. (See **MEDICINE**, n^o 37). Themison gave the first account of diacodium, which was prepared of the juice and decoction of poppy-heads and honey. He invented a purging medicine called *heira*.

THEMISTIUS, an ancient Greek orator and philosopher, a native of Paphlagonia, who flourished in the 4th century. He had great interest and favour with the emperors in his time, and though a heathen, was of a very tolerating spirit. He taught for many years at Constantinople, of which city he was made præfect by Julian and Theodosius; and lived to be exceeding old. More than 30 of his orations are still extant, beside commentaries on several parts of Aristotle's works.

THEMISTOCLES, the renowned Athenian admiral, general, and patriot, who gained the battle of Salamis against the Persians. Being banished his country by his ungrateful fellow-citizens, he fled to Artaxerxes king of Persia: but, in order to avoid taking up arms against his country, he slew himself, 464 B. C. See **ATICA**, n^o 76, *et seq.*

THEOBALD (Lewis), the son of an attorney at Sittingbourn in Kent, was a well-known writer and critic in the early part of the present century. He engaged in a paper called the *Censor*, published in *Mist's Journal*, wherein, by delivering his opinions with too little reserve concerning some eminent wits, he exposed himself to their resentment. Upon the publication of Pope's *Homer*, he praised it in terms of extravagant admiration, yet afterwards

thought proper to abuse it as earnestly; for which Pope at first made him the hero of his *Dunciad*, though he afterwards laid him aside for another. Mr Theobald not only exposed himself to the lashes of Pope, but waged war with Mr Dennis, who treated him more roughly, though with less satire. He nevertheless published an edition of *Shakespeare*, in which he corrected, with great pains and ingenuity, many faults that had crept into that poet's writings. This edition is still in great esteem; being in general preferred to those published by Pope, Warburton, and Hanmer. He also wrote some plays, and translated others from the ancients.

THEOBROMA, in botany: A genus of plants belonging to the class of *polyadelphia*, and order of *pentandria*; and in the natural system ranging under the 37th order, *Columnifera*. The calyx is triphyllous; the petals, which are five in number, are vaulted and two-horned; the nectarium is pentaphyllous and regular; the stamina grow from the nectarium, each having five antheræ. There are three species; the *cacao*, *guazuma*, and *angusta*.

The *cacao*, or chocolate tree, we shall describe in the words of Dr Wright: "In all the French and Spanish islands and settlements in the warmer parts of America, the chocolate tree is carefully cultivated. This was formerly the case also in Jamaica; but at present we have only a few straggling trees left as monuments of our indolence and bad policy."

"This tree delights in shady places and deep valleys. It is seldom above 20 feet high. The leaves are oblong, large, and pointed. The flowers spring from the trunk and large branches; they are small, and pale red. The pods are oval and pointed. The seeds or nuts are numerous, and curiously stowed in a white pithy substance."

"The cocoa-nuts being gently parched in an iron pot over the fire, the external covering separates easily. The kernel is levigated on a smooth stone; a little arnotto is added, and with a few drops of water is reduced to a mass, and formed into rolls of one pound each. This simple preparation is the most natural, and the best. It is in daily use in most families in Jamaica, and seems well adapted for rearing of children." See **CHOCOLATE**.

THEOCRACY, in matters of government, a state governed by the immediate direction of God alone: such was the ancient government of the Jews before the time of Saul.

THEOCRITUS, the father of pastoral poetry, was born at Syracuse in Sicily. Two of his poems ascertain his age; one addressed to Hiero king of Syracuse, who began his reign about 275 years before Christ; and the other to Ptolemy Philadelphus king of Egypt. Hiero, though a prince distinguished in arms and political wisdom, does not seem to have been a patron of learning. This is supposed to have given birth to the 16th *Idyllium*. From Syracuse Theocritus went to Alexandria, where he seems to have found a munificent patron in Ptolemy Philadelphus, if we may judge from the panegyric which he composed on that prince (the 17th *Idyllium*). It has been said that Theocritus was strangled by Hiero, but we have not found evidence of this.

The compositions of this poet are distinguished, among the ancients, by the name of *Idylliums*, in order to express the smallness and variety of their natures: they would now be called *Miscellanies*, or *Poems on several Occasions*. The first nine and the eleventh are confessed to be true pastorals, and hence Theocritus has usually passed for nothing more than a pastoral poet; yet he is manifestly robbed of a great part of his fame, if his other poems have not their proper laurels. For though the greater part of his *Idylliums* cannot be called the songs of shepherds, yet they have certainly their

Theobroma

Theodolphe Theodore. their respective merits. His pastorals ought to be considered as the foundation of his credit; upon this claim he will be admitted for the finisher as well as the inventor of his art, and will be acknowledged to have excelled all his imitators as much as originals usually do their copies.

The works of this poet were first published in folio by Aldus Manutius at Venice in 1495. A more elegant and correct edition was printed by Henry Stephens at Paris in 1566. An edition was published at Leipzig in 1765, with valuable notes by the learned Reiske. But what will most highly gratify the admirers of pastoral poetry, is an edition published in 1770, 2 vols 4to, by Mr Thomas Warton. It is accompanied by the scholia of the best editors, and the different readings of 15 MSS.

THEODOLPHE, a mathematical instrument for measuring heights and distances. See GEOMETRY, p 679.

THEODORE, king of Corsica, baron Niculhoff in the county of La Marc in Westphalia. He had his education in the French service, and afterwards went to Spain, where he received some marks of regard from the duke of Riparda and cardinal Alberoni; but being of an unsettled disposition, he quitted Spain, and travelled into Italy, England, and Holland, in search of some new adventure. He at last fixed his attention on Corsica, and formed the scheme of rendering himself sovereign of that island. He was a man of abilities and address; and having fully informed himself of every thing relating to Corsica, went to Tunis, where he fell upon means to procure some money and arms; and then went to Leghorn, from whence he wrote a letter to the Corsican chiefs Giasteri and Paoli, offering considerable assistance to the nation if they would elect him as their sovereign. This letter was consigned to Count Domenico Rivarola, who acted as Corsican plenipotentiary in Tuscany; and he gave for answer, that if Theodore brought the assistance he promised to the Corsicans, they would very willingly make him king.

Upon this he, without loss of time, set sail, and landed at Tavagna in the spring of the year 1736. He was a man of a very stately appearance, and the Turkish dress he wore added to the dignity of his mien. He had a few attendants with him; and his manners were so engaging, and his offers so plausible, that he was proclaimed king of Corsica before Count Rivarola's dispatches arrived to inform the chiefs of the terms upon which he had agreed. He brought with him about 1000 sequins of Tunis, beside some arms and ammunition, and made magnificent promises of foreign assistance; whence the Corsicans, who were glad of any support, willingly gave into his schemes. Theodore instantly assumed every mark of royal dignity. He had his guards and his officers of state; he conferred titles of honour, and struck money both of silver and copper. The silver pieces were few in number, and can now hardly be met with; the copper coins have on one side T. R. that is, "Theodorus Rex," with a double branch crossed, and round it this inscription, PRO BONO PUBLICO RE CO. that is, "For the public good of the kingdom of Corsica;" on the other side is the value of the piece; *Cinque solidi*, or five sous.

The Genoese were not a little confounded with this unexpected adventurer. They published a violent manifesto against Theodore, treating him with great contempt; but at the same time showing they were alarmed at his appearance. Theodore replied, in a manifesto, with all the calmness and dignity of a monarch; but after being about eight months in Corsica, perceiving that the people began to cool in their affections towards him, he assembled his chiefs, and declared he would keep them no longer in a state of uncertainty, being determined to seek in person the support he so

long expected. He settled an administration during his absence, recommended unity in the strongest terms, and left the island with reciprocal assurances of fidelity and affection. He went to Holland, where he was so successful as to obtain credit from several rich merchants, particularly Jews, who trusted him with cannon and other warlike stores to a great value, under the charge of a supercargo. With these he returned to Corsica in 1739; but by this time the French, as auxiliaries to the Genoese, had become so powerful in the island, that though Theodore threw in his supply of warlike stores, he did not incline to venture his person, the Genoese having set a high price on his head. He therefore again departed; and after many unavailing attempts to recover his crown, at length chose for retirement a country where he might enjoy the participation of that liberty which he had so vainly endeavoured to give his Corsicans; but his situation in England by degrees grew wretched, and he was reduced so low as to be several years before his death a prisoner for debt in the King's Bench. At length, to the honour of some gentlemen of rank, a charitable contribution was set on foot for him in the year 1753. Mr Boswell observes, that Mr Horace Walpole generously exerted himself for the unhappy Theodore, and wrote a paper in *The World* with great elegance and humour, soliciting a contribution for the unhappy monarch in distress, to be paid to Mr Robert Dodsley bookseller, as lord high treasurer. This brought him a very handsome sum, and he was set at liberty. That gentleman adds, that Mr Walpole has the original deed, by which Theodore made over the kingdom of Corsica in security to his creditors, and that he has also the great seal of the kingdom. Theodore died in 1756, and was buried in St Anne's churchyard, Westminster; where, in 1757, a simple undecorated monument of marble was erected to his memory by a gentleman, with an inscription; which, after mentioning some of the above particulars, concludes with the following lines:

The grave, great teacher, to a level brings
Heroes and beggars, galley-slaves and kings;
But Theodore this moral learn'd ere dead,
Fate pour'd its lesson on his living head,
Bestow'd a kingdom and deny'd him bread.

Theodore left a son, who was an accomplished gentleman.

THEODORET, bishop of St Cyricus in Syria, in the 4th century, and one of the most learned fathers of the church, was born in the year 386, and was the disciple of Theodorus Mopsuestia and St John Chrysostom. Having received holy orders, he was with difficulty persuaded to accept of the bishopric of St Cyricus, about the year 420. He discovered great frugality in the expences of his table, dress, and furniture, but spent considerable sums in improving and adorning the city of Cyricus. He erected two large bridges, public baths, fountains, and aqueducts, and laboured with great zeal and success in his diocese. Yet his zeal was not confined to his own church: he went to preach at Antioch and the neighbouring towns; where he became admired for his eloquence and learning, and had the happiness to convert multitudes of people. He wrote in favour of John of Antioch and the Nestorians, against Cyril's Twelve Anathemas; he afterwards attacked the opinions of Nestorius, and was deposed in the synod held by the Eutychians at Ephesus; but was again restored by the general council of Chalcedon, in which he was present, in 451. It is thought that he died soon after; though others say that he lived till the year 457. There are still extant Theodoret's excellent Commentary on St Paul's Epistles, and on several other books of the Holy Scriptures. 2. His Ecclesiastical History from the time of Arius to Theodosius the

“seed, offspring,” that branch of the heathen theology ^{Theognis.} which taught the genealogy of their gods.

Hesiod gives us the ancient theogony, in a poem under that title. Among the most ancient writers, Dr Burnet observes, that theogony and cosmogony signified the same thing. In effect, the generation of the gods of the ancient Persians, fire, water, and earth, is apparently no other than that of the primary elements.

THEOGNIS, an ancient Greek poet of Megara in Achaia, flourished about the 59th Olympiad, 144 B. C. We have a moral work of his extant, containing a summary of precepts and reflections, usually to be found in the collections of the Greek minor poets.

execution) to impart it to others. The Pagan philosopher, therefore, having cultivated the *art of thinking*, proceeds to that of *speaking*, in order to display his vanity in the dexterous use of deceit. On the other hand, the *Christian philosopher* cultivates the *art of speaking*, for the sole purpose of disseminating the truth in his office of preacher of the gospel."

As every man, before he enters upon the proper study of theology, receives, at least in this country, the rudiments of a liberal education, it may perhaps be superfluous to mention here any books as peculiarly proper to teach him the art of speaking: we cannot however forbear to recommend to our student the attentive perusal of Quintilian's *Institutions*, and Dr Blair's *Lectures on Rhetoric and the Belles Lettres*. A familiar acquaintance with these works will enable him, if he be endowed by nature with talents fit for the office in which he proposes to engage, to express his thoughts with correctness and elegance; "without which, it has been well observed, that science, especially in a clergyman, is but learned lumber, a burden to the owner, and a nuisance to every body else."

No man can proceed thus far in the pursuits of general science without having been at least initiated in the learned languages; but he who intends to make theology his profession should devote himself more particularly to the study of Greek and Hebrew, because in these tongues the original scriptures are written. By this we do not mean to insinuate that it is necessary for the man whose views aspire no farther than to the office of pastor of a Christian congregation, to make himself a profound critic in either of these ancient languages. The time requisite for this purpose is so long, that it would leave very little for other studies of infinitely more importance to him, whose proper business it is to instruct the ignorant in those plain and simple truths which are sufficient to guide all men in the way to salvation. Still, however, it is obvious, that he who is incapable of consulting the original scriptures, must rest his faith, not upon the sure foundation of the word of God, but upon the credit of fallible translators; and if he be at any time called upon to vindicate revelation against the scoffs of infidelity, he will have to struggle with many difficulties which are easily solved by him who is master of the original tongues.

The student having laid in this stock of preparatory knowledge, is now qualified to attend with advantage the theological lectures of a learned professor; but in doing this, he should be very careful neither to admit nor reject any thing upon the bare authority of his master. Right principles in theology are of the utmost importance, and can rest upon no authority inferior to that of the word of God. On this account we have long been of opinion, that a professor cannot render his pupils to much service by a systematical course of lectures, as by directing their studies, and pointing out the road in which they may themselves arrive in the shortest time at the genuine sense of the sacred scrip-

tures. In this opinion we have the honour to agree with the ablest lecturer § in theology that we have ever heard. The authors of all systems are more or less prejudiced in behalf of some particular and artificial mode of faith. He, therefore, who begins with the study of them, and afterwards proceeds to the sacred volume, sees with a jaundiced eye every text supporting the peculiar tenets of his first master, and acts as absurd a part as he who tries not the gold by the copel, but the copel by the gold. Before our young divine, therefore, sit down to the serious perusal of any one of those *institutes or bodies of theology* which abound in all languages, and even before he read that which the nature of our work compels us to lay before him, we beg leave, with the utmost deference to the superior judgment of our more learned readers, to recommend to his consideration the following

PRELIMINARY DIRECTIONS FOR THE STUDY OF THEOLOGY.

CHRISTIAN theology is divided into two great parts, *natural* and *revealed*; the former comprehending that which may be known of God from the creation of the world, even his eternal power and Godhead; the latter, that which is discovered to man nowhere but in the sacred volume of the Old and New Testaments.

Concerning the extent of natural theology many opinions have been formed, whilst some have contended that there is no such thing. Into these disputes we mean not at present to enter. We believe that one of them could have had no existence among sober and enlightened men, had the contending parties been at due pains to define with accuracy the terms which they used. Whatever be the origin of religion, which we have endeavoured to ascertain elsewhere (see RELIGION, n^o 6—17.), it is obvious, that no man can receive a written book as the word of God till he be convinced by some other means that God exists, and that he is a Being of power, wisdom, and goodness, who watches over the conduct of his creature man. If the progenitor of the human race was instructed in the principles of religion by the Author of his being (a fact of which it is difficult to conceive how a consistent theist can entertain a doubt), he might communicate to his children, by natural means, much of that knowledge which he himself could not have discovered had he not been supernaturally enlightened. Between illustrating or proving a truth which is already talked of, and making a discovery of what is wholly unknown, every one perceives that there is an immense difference (A).

To beings whose natural knowledge originates wholly from sensation, and whose minds cannot, but by much discipline, advance from sense to science, a long series of revelations might be necessary to give them at first just notions of God and his attributes, and to enable them to perceive the

5
Cautions to be observed in attending the lectures of a professor.

First principles of theology communicated

8
To the earliest mortals by repeated revelations.

(A) The discriminating powers of Aristotle will not be questioned; and in the following extract made by Cicero from some of his works which are now lost, he expresses our sentiments on this important subject with his usual precision:—"Præclare ergo Aristoteles, SI ESSENT, inquit, qui sub terra semper habitavissent, bonis, et illultribus domiciliis, quæ essent ornata signis atque picturis, instructaque rebus iis omnibus, quibus abundant ii, qui beati putantur, nec tamen exissent unquam supra terram: ACCEPISSENT AUTEM FAMA ET AUDITIONE, ESSE QUODDAM NUMEN, ET VIM DEORUM; deinde aliquo tempore, patefactis terre faucibus, ex illis abditis sedibus evadere in hæc loca, quæ nos incolimus, atque exire potuissent: cum repente terram, et maria, cælumque vidissent: nubium magnitudinem, ventorumque vim cognovissent, adpaxissentque solem, ejusque tum magnitudinem, pulchritudinemque, tum etiam efficientiam cognovissent, quod is diem efficeret, toto cælo hæc diffusa: cum autem terras nox opacasset, tum cælum totum cernerent astris distinctum et ornatum, lunæque luminum varietatem tum crescentis, tum senescentis, eorumque omnium ortus et occasus, atque in omni æternitate ratos, immutabilesque cursus: hæc cum viderent, PERFECTO ET ESSE DEOS, et HÆC TANTA OPERA DEORUM ESSE arbitrarentur." *De Nat. Deorum*, lib. ii. § 37.

Preliminary Directions.

And yet may be properly termed natural principles.

to Natural theology to be studied before the doctrines of revelation.

the relation between the effect and its cause, so as to infer by the powers of their own reason the existence of the Creator from the presence of his creatures. Such revelations, however, could be satisfactory only to those who immediately received them. Whenever the Deity has been pleased by supernatural means to communicate any information to man, we may be sure that he has taken effectual care to satisfy the person so highly favoured that his understanding was not under the influence of any illusion; but such a person could not communicate to another the knowledge which he had thus received by any other means than an address to his rational faculties. No man can be required to believe, no man indeed can believe, without proof, that another, who has no more faculties either of sensation or intellect than himself, has obtained information from a source to which he has no possible access. An appeal to miracles would in this case serve no purpose; for we must believe in the existence, power, wisdom, and justice, of God, before a miracle can be admitted as evidence of any thing but the power of him by whom it is performed. See MIRACLE.

It is therefore undeniable that there are some principles of theology which may be called *natural*; for though it is in the highest degree probable that the parents of mankind received all their theological knowledge by *supernatural* means, it is yet obvious that some parts of that knowledge must have been capable of a proof purely rational, otherwise not a single religious truth could have been conveyed through the succeeding generations of the human race but by the immediate inspiration of each individual. We indeed admit many propositions as certainly true, upon the sole authority of the Jewish and Christian scriptures, and we receive these scriptures with gratitude as the lively oracles of God; but it is self-evident that we could not do either the one or the other, were we not convinced by natural means that God exists, that he is a Being of goodness, justice, and power, and that he inspired with divine wisdom the penmen of these sacred volumes. Now, though it is very possible that no man or body of men, left to themselves from infancy in a desert world, would ever have made a theological discovery; yet whatever propositions relating to the being and attributes of the first cause and the duty of man, can be demonstrated by human reason, independent of written revelation, may be called *natural theology*, and are of the utmost importance, as being to us the first principles of all religion. Natural theology, in this sense of the word, is the foundation of the Christian revelation; for without a previous knowledge of it, we could have no evidence that the scriptures of the Old and New Testaments are indeed the word of God.

Our young divine, therefore, in the regular order of his studies, ought to make himself master of *natural theology* be-

fore he enter upon the important task of searching the scriptures. On this subject many books have been published in our own and other languages; but perhaps there is none more worthy of attention than the Religion of Nature delineated by Mr Wollaston (B). It is a work of great merit, and bears ample testimony to its author's learning and acuteness: yet we think it ought to be read with caution. Mr Wollaston's theory of moral obligation is fanciful and groundless; and whilst we readily acknowledge that he demonstrates many truths with elegance and perspicuity, we cannot deny that he attempts a proof of others, for which we believe no other evidence can be brought than the declarations of Christ and his apostles in the holy scriptures. To supply the defects of his theory of morals, we would recommend to the student an attentive perusal of Cumberland on the Law of Nature, and Paley's Elements of Moral Philosophy. A learned author* affirms of Cumberland, that "he excels all men in fixing the true grounds of moral obligation, out of which natural law and natural religion both arise;" and we have ourselves never read a work in which the various duties which a man owes to his Maker, himself, and his fellow-creatures, are more accurately stated or placed on a surer basis than in the moral treatise of the archdeacon of Carlisle.

As Wollaston demonstrates with great perspicuity, and to the absolute conviction of every man capable of feeling the force of argument, the being and many of the attributes of God, it may perhaps appear superfluous to recommend any other book on that subject. The present age, however, having, among other wonderful phenomena, witnessed a revival of the monster *Atheism*, we would advise our student to read with much attention Cudworth's Intellectual System, and to read it rather in Mosheim's Latin translation than in the author's original English. In the original, though many authors are quoted that are now but little known, there are very few references to the book, or chapter, or section, from which the quotations are taken. These omissions are supplied by the translator, who has likewise enriched his edition with many valuable and learned notes. It is well known that Cudworth wrote his incomparable work in confutation of Hobbes's philosophy; but instead of confining himself to the whimsies of his antagonist, which were in a little time to sink into oblivion, he took a much wider range, and traced atheism through all the mazes of antiquity, exposing the weakness of every argument by which such an absurdity had ever been maintained. In exhausting the metaphysical questions agitated among the Greeks concerning the being and perfections of God, he has not only given us a complete history of ancient learning, as far as it relates to these inquiries, but has in fact anticipated most of the sophisms of our modern atheists, who are by

3 G 2

no

From this passage it is evident, that the Stagyrite, though he considered the motions of the heavenly bodies, the ebbing and flowing of the sea, and the other phenomena of nature, as affording a complete *proof* of the being and providence of God, did not however suppose that from these phenomena an untaught barbarian would *discover* this fundamental principle of religion. On the contrary, he expressly affirms, that before a man can feel the force of the evidence which they give of this important truth, he must have HEARD of the existence and power of God.

(B) It may not be improper to inform the reader, that Mr Wollaston, the author of the Religion of Nature, was a different man from Mr Woolston, who blasphemed the miracles of our Saviour. The former was a clergyman of great piety, and of such moderate ambition as to refuse one of the highest preferments in the church of England when it was offered to him; the latter was a layman remarkable for nothing but gloomy infidelity, and a perverse desire to deprive the wretched of every source of comfort. In the mind of the former, philosophy and devotion were happily united; in the mind of the latter, there was neither devotion nor science. Yet these writers have been frequently confounded; sometimes through inadvertence from the similarity of their names; and sometimes, we are afraid, designedly, from a weak and bigotted abhorrence of every system of religion that pretends to have its foundation in reason and in the nature of things.

tions.

How he
shall be
to be
taught.

no means such discoverers as they are supposed to be by their illiterate admirers.

The student having made himself master of natural theology, and carefully endeavoured to ascertain its limits, is now prepared to enter upon the important task of searching the scriptures. In doing this, he ought to divest himself as much as possible of the prejudices of education in behalf of a particular system of faith, and sit down to the study of the sacred volume as of a work to which he is an entire stranger. He ought first to read it as a moral history of facts and doctrines, beginning with the books of Moses, and proceeding through the rest, not in the order in which they are commonly published, but in that in which there is reason to believe they were written (see SCRIPTURES). If he be master of the Hebrew and Greek languages, he will doubtless prefer the original text to any version; and in this respect we would advise him to consult no commentaries, because his chief object at present is not to study the doctrines contained in the bible, but merely to discover what are the subjects of which it treats. Many histories of the bible have been written; and were we acquainted with a good one, we should recommend it as a clue to direct the young divine's progress through the various books which compose the sacred volume. Stackhouse's history has been much applauded by some, and as much censured by others. It is not a work of which we can express any high degree of approbation; but if read with attention, it may no doubt be useful as a guide to the series of facts recorded in the scriptures. Between the Old and New Testaments there is a great chasm in the history of the Jewish nation; but it is supplied in a very able and satisfactory manner by Dr Prideaux, whose *Old and New Testament connected* is one of the most valuable historical works in our own or any other language. Stackford's *Sacred and Profane History of the World connected* is likewise a work of merit, and may be read with advantage at throwing light upon many passages of the Old Testament: but this author is not intitled to the same confidence with Prideaux, as his learning was not so great, and his partialities seem to have been greater.

In thus making himself master of the history of the Old and New Testaments, the student will unavoidably acquire some general notion of the various doctrines which they contain. These it will now be his business to study more particularly, to ascertain the precise meaning of each, and to distinguish such as relate to the whole human race, from those in which Abraham and his posterity were alone interested. He must therefore travel over the sacred volume a second time; and still we would advise him to travel without a guide. From Walton's *Polyglot Bible*, and the large collection called *Critici sacri*, he may indeed derive much assistance in his endeavours to ascertain the sense of a difficult text; but we think he will do well to make little use of commentators and expostors, and still less of system-builders, till he has formed some opinions of his own respecting the leading doctrines of the Jewish and Christian religions.

"Impressed (says an able writer) with an awful sense of the importance of the sacred volume, the philosophical divine will shake off the bias of prejudices however formed, of opinions however sanctioned, and of passions however constitutional, and bring to the study of it the advantage of a pure and impartial mind. Instead of wasting all his labour upon a number of minute and less significant particulars, and of refusing away plain and obvious sense by the

subtleties of a narrow and corrosive mind, his first object will be to institute a theological inquiry into the general design of the written word; and from principles fully contained and fairly understood, to illustrate the true nature and genius of the religious dispensation in all its parts. He will mark the difference between the first and second covenants, and observe the connection that subsists between them. He will trace the temporary economy of the *Old Testament*, and weigh the nature and intent of the *partial covenant* with the Jews; observing with astonishment how it was made introductory of better things to come: and he will follow it through the *law* and the *prophets* in its wonderful evolutions, till he see this vast and preparatory machine of providence crowned and completed in the eternal gospel. This *New Testament*, the last and best part of the religious dispensation, he will pursue through the sacred pages of that gospel with redoubled attention; contemplating the divine foundation on which it claims to be built, the supernatural means by which it was executed, and the immortal end which it has in view.*"

Preliminary Direc-
tions.

* Thomas's
History of
the
Church.

In the course of this inquiry into the import of the sacred volume, the student will pay particular attention to the circumstances of the age and country in which its various writers respectively lived, and to the nature of the different *styles*, *analogical* and *parabical*, in which it is written. He will likewise keep in mind that God, whom it claims for its author, is the parent of truth, and that all his actions and dispensations must be consistent with one another. He will therefore compare the different passages of the Old and New Testaments which relate to the same doctrine, or to the same event, reasonably concluding that the bible must be the best interpreter of itself; and though the opinions which he thus forms may often be erroneous, they will seldom be dangerous errors, and may easily be corrected by mature reflection, or by consulting approved authors who have treated before him of the various points which have been the subject of his studies. Of this mode of proceeding one good consequence will be, that, having from the sacred scriptures formed a system of theology for himself, he will afterwards study the systems of other men without any violent prejudices for or against them; he will be so much attached to his own opinions as not to relinquish them in obedience to mere human authority, at the same time that he will be ready to give them up when convinced that they are not well founded; and if he have read the scriptures to any good purpose, he will have acquired such a love of truth as to embrace her wherever she may be found, whether among Papists or Protestants, in the school of Arminius or in that of Calvin.

As we have supposed that every man, after having formed a theological system of his own, will consult the systems of others: it may perhaps be expected that we should here recommend those which, in our opinion, are most worthy of his attention. To do this, however, would, we apprehend, be a very ungracious interference with the rights of private judgment. It would be to arrogate to ourselves a kind of authority to which, when assumed by others, we have cautioned our readers not to submit. But lest we should be suspected of wishing to bias the mind of the young student toward the short system which we are obliged to give, we shall just observe, that by the divines of what is called the *Arminian school*, Episcopius's *Theologia Institutiones* (c), Limborck's *Theologia Christiana*, and Locke's *Reasonableness*

13
Approved
systems of
divinity.

(c) There is, however, one chapter of this work which the majority of Arminians loudly condemn. Episcopius acknowledges

Preliminary Directions.

sonableness of Christianity, have long been held in the highest esteem; whilst the followers of Calvin have preferred the *Institutiones* of their master, Turretine's *Institutio Theologicæ* *Elementaræ*, and Gill's *Body of Divinity*. This last work, which was published in two vols 4to in 1769, has many merits and many defects. Its style is coarse, impure, and tedious; and the author, who was a zealous antipædo-baptist, and seems to have possessed very little science, embraces every opportunity of introducing the discriminating tenets of his sect: but his book is fraught with profound learning, breathes the spirit of piety, and may be read with advantage by every divine who has previously formed the outlines of a system for himself.

As the Jewish and Christian dispensations are closely linked together, being in truth but parts of one great whole, it is impossible to have an adequate notion of the latter without understanding the design of the former. Now, though the Mosaic religion is nowhere to be learned but in the Old Testament, it may be convenient for our student, after he has formed his own opinions of it from that sacred source, to know what has been written on the subject by others. For illustrating the ritual law, a learned prelate warmly recommends the *Disser. Dubitatorum* of Maimonides, and Spencer's book entitled *De Legibus Hebræorum Ritibus*. Both works have undoubtedly a great merit; but our young divine will do well to read along with them *Heremensi Vagâ Dissertatio*, and Dr Woodward's Discourse on the Worship of the Ancient Egyptians, communicated to the London Society of Antiquaries in 1775, where some of Spencer's notions are shortly and ably refuted. On the other parts of this dispensation, such as the nature of its civil government; the rewards and punishments peculiar to it (p); its extraordinary administration by appointed agents, endowed with supernatural powers, and with the gifts of miracles and prophecy; the *double sense* in which the latter is sometimes involved; and the language consequent to its nature and use—the reader will find much erudition and industry displayed in the second part of Warburton's *Divine Leg. or an Inquiry into the Antiquity of Moses demonstrated*. His Lordship indeed is supplied by many, and perhaps justly, to have advanced, together with a great deal of good sense, many paradoxes in his favourite work; but still that work is entitled to a serious perusal, for it displays great learning and genius, and, we believe, the heaviest censures have fallen upon it from those by whom it was never read.

Having proceeded thus far in the course, the student's next business should be to inquire seriously what evidence there is that the doctrines which he has so carefully studied were indeed revealed in times past by God. He must already have perceived, in the nature and tendency of the doctrines themselves, strong marks of their origin being

more than human; but he must likewise have met with many difficulties, and he must prepare himself to repel the attacks of unbelievers. Here he will find opportunities of exerting the utmost powers of his reasoning faculties, and of employing in the service of religion all the stores he may have amassed of human learning. The scriptures pretend to have been written by several men who lived in different ages of the world; but the latest of them in an age very remote from the present. His first business therefore must be to prove the authenticity of these books, by tracing them up by historical evidence to the several writers whose names they bear. But it is not enough to prove them authentic. They profess to have been written by men divinely assisted and inspired, and of course infallible in what they wrote. He must therefore inquire into the truth of this inspiration. "The Bible contains a number of truths doctrinal and moral, which are called *mysteries*, and asserted to be the immediate dictates of God himself. To evince this great point to man, a number of supernatural *tests* and *evidences* are inseparably connected with those mysteries; so that if the former be true, the latter must likewise be so. He must therefore examine these tests and evidences, to establish the divinity of the Holy Scriptures;" and in this part of his course he will find much assistance from many writers whose defences of the truth and divinity of the Christian religion do honour to human nature.

The first step towards the embracing of any truth is, to get fairly rid of the objections which are made to it; and the general objections made by deistical writers to the Christian revelation are by no writer more completely removed than by Bishop Butler, in his celebrated work entitled *The Analogy of Religion natural and revealed to the Constitution and Course of Nature*. This book therefore the student should read with attention, and meditate upon with patience; but as it does not furnish a *positive proof* of the divinity of our religion, he should pass from it to *Govius de Veritate Religionis Christianæ*, and Stillin gree's *Origines Sacræ*. Both these works are excellent; and the latter, which may be considered as an improvement of the former, is perhaps the full and ablest defence of revelation in general that is to be found in any language. In this part of the united kingdom it is now indeed hardly mentioned, or mentioned with indifference; but half a century ago the English divines thought it a subject of triumph, and styled its author their *incomparable antagonist*. Other works, however, may be read with great advantage, and none with greater than Paley's *Evidences of the Christian Religion*, and Leslie's *Short Method with the Deists*; which last work, in the compass of a very few pages, contains proofs of the divinity of the Jewish and Christian revelations, to which the celebrated Dr

16
Book recommended on this subject.

Mid-

ledge (lib. iv. sect. 2. cap. 33.) that it may be proved from scripture, that the person who was afterwards Jesus Christ was from eternity the only begotten of his Father, by whom all things were made, and that therefore he is really and truly God. He mentions five senses in which our Saviour is called the son of God; and shews that in this fifth and last sense the filiation is peculiar to him alone. Yet in cap. 34. he states the following question: "An quintus iste modus filiationis Jesu Christi ad salutem scitu ac creditu necessarius sit, usque, qui illum negant, anathema dicendum sit?" and gravely answers it in the negative. It is not to be wondered at that most Arminians differ from this celebrated remonstrant in their answers to this question: for nothing can be more absurd than to hold religious communion with those who deny the divinity of that person, whose divinity, it is *acknowledged*, may be clearly proved. Against this extravagant position many Arminian pens were drawn; but none to better purpose than that of Bishop Bull, whose *Judicium Ecclesiæ Catholicæ trium primorum seculorum, &c. assertum contra M. Simonem Episcopium alioque*, obtained for its author the thanks of the whole clergy of France assembled (1710) at *St Germain en Laye* in a national synod.

(p) On this subject the reader will find many excellent observations in Bishop Bull's *Harmonia Apostolica*, with its several defences, and in a small book of Dr Wells's, entitled *An Help for the right understanding of the several Divine Laws and Covenants, whereby man has been obliged through the several ages of the world to guide himself in order to salvation*.

Urelini- Middleton confessed (E), that for 20 years he had laboured
nary Direc- in vain to fabricate a specious answer (F).

Having satisfied himself of the truth of revelation in general, it may be worth the young divine's while to provide a defence of the Christian religion against the objections of modern Judaism. In this part of his studies he will need no other instruction than what he may reap from Limborch's work entitled *De Veritate Religionis Christianæ amica collatio cum erudito Judeo*. "In that disputation which was held with Orobio, he will find all that the stretch of human parts on the one hand, or science on the other, can produce to varnish error or unravel sophistry. All the papers of Orobio in defence of Judaism, as opposed to Christianity, are printed at large, with Limborch's answers, section by section; and the subtilest sophisms of a very superior genius are ably and satisfactorily detected and exposed by the strong, profound, and clear reasoning, of this renowned remonstrant †." See OROBIO and LIMBORCH.

† Warburton's Directions for the Study of Theology.

18 And the various controversies among Christians themselves.

The various controversies subsisting between the several denominations of Christians, about points which separate them into different churches, ought next to be studied in the order of the course; for nothing is unimportant which divides the followers of that Master whose favourite precept was *love*. It has indeed been long fashionable to decry polemical divinity as an useless, if not a pernicious, study; but it is not impossible that this fashion, like many others, has had its origin in ignorance, and that it tends to perpetuate those schisms which it professes to lament. We are, however, far, very far, from recommending to the young divine a perusal of the works of the several combatants on each side of a disputed question, till he has fitted himself for judging between them by a long course of preparatory study; and the only preparation which can fit him for this purpose is an impartial and comprehensive study of ecclesiastical history. He who has with accuracy traced the progress of our holy religion from the days of the apostles to the present time, and marked the introduction of new doctrines, and the rise of the various sects into which the Christian world is unhappily divided, is furnished with a criterion within himself by which to judge of the importance and truth of the many contended doctrines; whilst he who, without this preparation, shall read a multitude of books on any one religious controversy, will be in danger of becoming a convert to his last author, if that author possess any tolerable share of art and ingenuity. This we know was the case with Pope, who declares, that in studying the controversy between the churches of England and Rome, he found himself a Papist and Protestant by turns, according to the last book he read.

19 Importance of ecclesiastical history, and books recommended.

There are many histories of the Christian church which possess great merit, but we are acquainted with none which appears to us wholly impartial. Mosheim's is perhaps the

most perfect compend (G); and one of its greatest excellencies is, that on every subject the best writers are referred to for fuller information. These indeed should often be consulted, not only to supply the defects necessarily resulting from the narrowness of the limits which the author, with great propriety, precribed to himself; but also to correct his partial obliquities; for with all his merits, and they were many and great, he is certainly not free from the influence of prejudice. Indeed there is no coming at the true history of the primitive church, but by studying the works of the primitive writers; and the principal works of the four first centuries will amply reward the labour of perusing them (H). The rise and progress of the reformation in general, the most important period of church history, may be best learned from Sleidan's book *De Statu Religionis et Reipublicæ Carolo V. Cæsare Commentarii*; the History of the Reformation of the Church of Scotland from Knox and Spotswood; and that of the Church of England from the much applauded work of Bishop Burnet.

After this course of ecclesiastical history, the young divine may read with advantage the most important controversies which have agitated the Christian world; for he will not read them without danger of giving up his faith to the mere authority of great names. To enumerate these controversies, and to point out the ablest authors who have written on each, would be a very tedious, and perhaps not a very profitable, task. On one controversy, however, we are induced to recommend a very masterly work, because it is sufficient of itself to fix the principles of Protestants with respect to the church of Rome, and to put to shame the fashionable censurers of *polemical divinity*. The work to which we allude is Chillingworth's book against Knott, entitled *The Religion of Protestants a safe way to Salvation*; in which the school jargon of that subtle Jesuit is incomparably exposed, and the long dispute between the Popish and Reformed churches placed on its proper ground, the Holy Scriptures.

One of the strongest and most plausible objections to the study of polemical divinity, is its tendency to give a rigid turn to the sentiments of those long engaged in it; whilst we know, from higher authority than that of the ablest disputant, that "the end of the commandment is charity." But for preserving charity in the minds of Christians, there are better means than absolute ignorance or indifference to truth. Charity is violated only when a church unreasonably restrains the inquiries of its own members, or exercises intolerance towards those who have renounced its jurisdiction. The injustice of the first species of ecclesiastical tyranny is exposed in a very masterly manner by Jeremy Taylor in his *Liberty of Prophecy*, and by Stillingfleet in his *Irenicum*; the injustice of the second, by Locke in his celebrated Letters on Toleration. The man who shall perse-
use

(E) This piece of information we had from the late Dr Berkeley, prebendary of Canterbury, who had it from Archbishop Seeker, to whom the confession was made.

(F) To these defences of revelation we might have added the collection of sermons preached at Boyle's lecture from 1691 to 1732, published in three volumes folio, 1739; the works of Leland; Bishop Newton's Dissertations on Prophecy; and above all, Lardner's Credibility of the Gospel History, with the Supplement to it. But there would be no end of recommending eminent writers on this subject. We have mentioned such as we most approve among those with whom we are best acquainted; but we must, once for all, caution the reader against supposing that we approve of every thing to be found in any work except the sacred scriptures.

(G) The Bishop of Landaff, in the catalogue of books published at the end of his Theological Tracts, recommends several other ecclesiastical histories as works of great merit; such as Dupin's, Echard's, Gregory's, and Foimey's, together with Pauli Ernesti Jablonski *Institutiones Historiæ Christianæ*, published at Frankfort in three volumes, 1754-67.

(H) For a proof of this position, and for a just estimate of the value of the *Fathers*, as they are called, see the introduction to Warburton's Julian, and Kett's Sermons at Bampton's Lectures.

use these three works, and impartially weigh the force of their arguments, will be in no danger, unless his pride be very great, or his temper uncommonly irritable, of thinking uncharitably of those from whose principles the love of truth may compel him to dissent.

In these directions for the study of theology, we might have enumerated many more books on each branch of the subject well deserving of the most attentive perusal; but he who shall have gone through the course here recommended, will have laid a foundation on which, if he continue his diligence, he may raise such a superstructure as will entitle him to the character of an accomplished divine. His diligence must indeed be continued through life; for when a man ceases to make acquisitions in any department of learning, he soon begins to lose those which he has already made; and a more contemptible character is nowhere to be found than that of a clergyman unacquainted with the learning of his profession. This learning, however, is not to be acquired, and indeed is hardly to be preserved, by studying *bodies or institutes of theology*; and though we have mentioned a few generally approved by two rival sects of Christians, and must, in conformity with the plan of our work, give another ourselves, we do not hesitate to declare, that the man who has carefully gone through the course of study which we have recommended, though it be little more than the outlines on which he is to work, may, with no great loss to himself, neglect ours and all other systems. For as an excellent writer *, whom we have often quoted, well observes, “to judge of the *fact* whether such a revelation containing such a principle, with its mysteries and credentials, was actually sent from God and received by man, by examining the *evidences and circumstances* which accompanied it—the *time when*, the *place where*, the *manner how*, it was delivered—the *form* in which it descends to us—and in what it is *contained*—together with the particular *substance and burden* of it—and how every part is to be rightly understood: these are the various and extensive subjects which constitute the sublime office of THEOLOGIC REASONING and

the PROPER STUDY OF DIVINITY.” On this account we shall pass over slightly, and sometimes perhaps without any notice, many things which every clergyman ought thoroughly to understand, and confine ourselves, in the short compend which we are to give, to the prime articles of Christian theology. In doing this, we shall endeavour as much as possible to divest ourselves of party prejudices; but as we are far from thinking that this endeavour will be completely successful (for we believe there is no man totally free from prejudice), we cannot conclude this part of the article more properly than with the following solemn CHARGE, with which a very learned divine † always prefaced his Theological Lectures.

Preliminary Dedications.

Dr Taylor of Norwich

I. “I do solemnly charge you, in the name of the God of Truth, and of our Lord Jesus Christ, who is the Way, the Truth, and the Life, and before whose judgment seat you must in no long time appear, that in all your studies and inquiries of a religious nature, present or future, you do constantly, carefully, impartially, and conscientiously, attend to evidence, as it lies in the Holy Scriptures, or in the nature of things, and the dictates of reason; cautiously guarding against the fallies of imagination, and the fallacy of ill-grounded conjecture.

A charge to students of theology.

II. “That you admit, embrace, or assent, to no principle or sentiment by me taught or advanced, but only so far as it shall appear to you to be supported and justified by proper evidence from revelation or the reason of things.

III. “That if, at any time hereafter, any principle or sentiment by me taught or advanced, or by you admitted or embraced, shall, upon impartial and faithful examination, appear to you to be dubious or false, you either suspect or totally reject such principle or sentiment.

IV. “That you keep your mind always open to evidence: That you labour to banish from your breast all prejudice, prepossession, and party zeal: That you study to live in peace and love with all your fellow Christians; and that you steadily assert for yourself, and freely allow to others, the unalienable rights of judgment and conscience.”

PART I. OF NATURAL THEOLOGY.

SECT. I. Of the Being and Attributes of God.

HE who cometh to God, says an ancient divine *, deeply read in the philosophy of his age, must believe that he is, and that he is a rewarder of them who diligently seek him. This is a truth as undeniable as that a man cannot concern himself about a nonentity. The existence of God is indeed the foundation of all religion, and the first principle of the science which is the subject of this article. It is likewise a principle which must command the assent of every man who has any notion of the relation between effects and their causes, and whose curiosity has ever been excited by the phenomena of nature. This great and important truth we have elsewhere endeavoured to demonstrate (see METAPHYSICS, Part III. Chap. vi.); but it may be proved by arguments less abstracted from common apprehension than the nature of that article required us to use. Of these we shall give one or two, which we hope will be level to every ordinary capacity; whilst, at the same time, we earnestly recommend to the young divine a diligent study of those books on the subject which we have mentioned in the preceding directions.

We see that the human race, and every other species of animals, is at present propagated by the co-operation of two parents; but has this process continued from eternity? A

moment's reflection will convince us that it has not. Let us take any one man alive, and, to avoid perplexity, let us suppose his father and mother dead, and himself the only person at present existing: how came he into the world? It will be said he was produced mechanically or chemically by the conjunction of his parents, and that his parents were produced in the same manner by theirs. Let this then be supposed; it must surely be granted, that when this man was born, an addition was made to the series of the human race. But a series which can be enlarged may likewise be diminished; and by tracing it backwards, we must at some period, however remote, reach its beginning. There must therefore have been a first pair of the human race, who were not propagated by the conjunction of parents. How did these come into the world?

Anaximander tells us *, that the first men and all animals were bred in warm moisture, inclosed in crustaceous skins like crab-fish or lobsters; and that when they arrived at a proper age, their shelly prisons growing dry, broke, and made way for their liberty. Empedocles informs us, that mother Earth at first brought forth vast numbers of legs, and arms, and heads, &c. which, approaching each other, arranging themselves properly, and being cemented together, started up at once full grown men. Another of these philosophers relates, that there first grew up a sort of wombs, which

which having their roots in the earth, attracted thence a kind of milk for the nourishment of the ætus, which in process of time broke through the membranes and fitted for itself; whilst the Egyptian fathers of this hopeful school content themselves with simply affirming, that animals like vegetables spring at first from the bosom of the earth.

Scarcely those sages, or their followers, should have been able to tell us why the earth has not in any climate this power of putting forth vegetable men or the parts of men at present. If this universal parent be eternal and self-existent, it must be incapable of decay or the smallest change in any of its qualities; if it be not eternal, we shall be obliged to find a cause for its existence, or at least for its form and all its powers. But such a cause may have produced the first human pair, and undoubtedly did produce them, without making them spring as plants from the soil. Indeed the growth of plants themselves clearly evinces a cause superior to any vegetative power which can be supposed inherent in the earth. No plant, from the sturdy oak to the creeping ivy, can be propagated but from seed or slips from the parent stock; but when one contemplates the regular process of vegetation, the existence of every plant implies the prior existence of a parent seed, and the existence of every seed the prior existence of a parent plant. Which then of these, the oak or the acorn, was the first, and whence was its existence derived? Not from the earth; for we have the evidence of universal experience that the earth never produces a tree but from seed, nor seed but from a tree. There must therefore be some superior power which formed the first seed or the first tree, planted it in the earth, and gave to it those powers of vegetation by which the species has been propagated to this day.

24
And veritable,

25
And from the laws of attraction and repulsion, &c

Thus clearly do the processes of generation and vegetation indicate a power superior to those which are usually called the powers of nature. The same thing appears no less evident from the laws of attraction and repulsion, which plainly prevail through the whole system of matter, and hold together the stupendous structure. Experiment shows that very few particles of the most solid body are in actual contact with each other (see OPTICS, n^o 63—65. PHYSICS, n^o 23.); and that there are considerable interstices between the particles of every elastic fluid, is obvious to the smallest reflection. Yet the particles of solid bodies strongly cohere, whilst those of elastic fluids repel each other. How are these phenomena accounted for? To say that the former is the effect of attraction and the latter of repulsion, is only to say that two individual phenomena are subject to those laws which prevail through the whole of the classes under which they are respectively arranged; whilst the question at issue is concerning the ORIGIN OF THE LAWS THEMSELVES, the power which makes the particles of gold cohere, and those of air repel each other. Power without substance is inconceivable; and by a law of human thought, no man can believe a being to operate but where it is in some manner or other actually present: but the particles of gold adhere, and the particles of air keep at a distance from each other, by powers exerted where no matter is present. There must therefore be some substance endowed with power which is not material.

Of this substance or being the power is evidently immense. The earth and other planets are carried round the sun with a velocity which human imagination can hardly conceive. That this motion is not produced by the agency of these vast bodies on one another, or by the interposition of any material fluid, has been shown elsewhere (see METAPHYSICS, n^o 196—200. and OPTICS, n^o 67); and since it is a law of our best philosophy, that we are not to multiply substances without necessity, we must infer that the same Being

which formed the first animals and vegetables, endowing them with powers to propagate their respective kinds, is likewise the cause of all the phenomena of nature, such as cohesion, repulsion, elasticity, and motion, even the motions of the heavenly bodies themselves.

If this powerful Being, who is the parent of vegetable and animal life, and the source of all corporeal motions, be self-existent, intelligent, and independent in his actions and volitions, he is an original or first cause, and that Being whom we denominate God. If he be not self-existent and independent, there must be a cause in the order of nature prior and superior to Him, which is either itself the first cause, or a link in that series of causes and effects, which, however vast we suppose it, must be traced ultimately to some one Being, who is self-existent, and has in himself the power of beginning motion, independent of every thing but his own intelligence and volition. In vain have the Atheists alleged, that the series may ascend infinitely, and for that reason have no first mover or cause. An infinite series of successive beings involves an absurdity and contradiction (see METAPHYSICS, n^o 298); but not to insist upon this at present, we shall only beg leave to consider such a series as a whole, and see what consequences will flow from the supposition. That we may with logical propriety consider it in this light, is incontrovertible; for the birth of every individual of the human race shows that it is made up of parts; but parts imply a whole as necessarily as an attribute implies its substance. As in this supposed series there is no cause which is not likewise an effect, nor any body moving another which was not itself moved by a third, the whole is undeniably equivalent to an infinite effect, or an infinite body moved: but if a finite effect must necessarily have proceeded from a cause, and a finite body in motion must have been put into that state by a mover, is there a human mind which can conceive an infinite effect to have proceeded from no cause, or an infinite body in motion to have been moved by nothing? No, surely! An infinite effect, were such a thing possible, would compel us to admit an infinite cause, and an infinite body in motion a mover of infinite power.

This great cause is God, whose wisdom, power, and goodness, all nature loudly proclaims. That the phenomena which we daily see evince the existence of one such Being, has just been shown; and that we have no reason to infer the existence of more than one, a very few reflections will make abundantly evident. For, not to lay more stress than it will bear upon that rule of Newton's, which forbids us to multiply substances without necessity, such a harmony prevails through the whole visible universe, as plainly shows it to be under the government of one intelligence. That on this globe the several elements tend for nourishment to plants, plants to the inferior animals, and animals to man; that the other planets of our system are probably inhabited, and their inhabitants nourished in the same or a similar manner; that the sun is so placed as to give light and heat to all and by the law of gravitation to bind the whole planets into one system with itself—are truths so obvious and so universally acknowledged, as to supersede the necessity of establishing them by proof. The fair inference therefore is, that the solar system and all its parts are under the government of one intelligence, which directs all its motions and all the changes which take place among its parts for some wise purposes. To suppose it under the government of two or more intelligences would be highly unreasonable; for if these intelligences had equal power, equal wisdom, and the same designs, one of them would evidently be superfluous; and if they had equal power and contrary designs, they could not be the parents of that harmony which we clearly perceive to prevail in the system.

of God.

But the Being capable of regulating the movements of so vast a machine, may well be supposed to possess infinite power, and to be capable of superintending the motions of the universe. That the widely extended system of nature is but one system, of which the several parts are united by many bonds of mutual connection, has been shown elsewhere (see *PHYSICS*), and appears daily more and more evident from our progress in physical discoveries; and therefore it is in the highest degree unreasonable to suppose that it has more than one author, or one supreme governor.

28
infinite
wer,
dom,
1

As the unity of design apparent in the works of creation plainly prove the unity of their Author, so do the immensity of the whole, and the admirable adjustment of the several parts to one another, demonstrate His power and His wisdom. On this subject the following beautiful reflections by Mr Wollaston are deserving of the most serious attention.

Religion
Nature,
2. v.
pp. 14.

“ In order (says that able writer ||) to prove to any one the grandness of this fabric of the world, one needs only to bid him consider the *sun*, with that insupportable glory and lustre that surrounds it; to demonstrate its vast distance, magnitude, and heat; to represent to him the chorus of planets moving periodically, by uniform laws, in their several orbits about it; guarded some of them by secondary planets, and as it were emulating the state of the sun, and probably all possessed by proper inhabitants; to remind him of those surprising visits which the *comets* make to us, and the large trains or uncommon splendor which attends them, the far country from which they come, and the curiosity and horror which they excite not only among us, but in the inhabitants of other planets, who may also be up to see the entry and progress of these ministers of fate: to direct his eye and contemplation through those azure fields and vast regions above him up to the *fixed stars*, that radiant numberless host of heaven; and to make him understand how unlikely a thing it is that they should be placed there only to adorn and bespan a canopy over our heads; to convince him that they are rather so many *other suns*, with their several systems of planets about them; to show him by the help of glasses still more and more of these fixed lights, and to beget in him an apprehension of their inconceivable numbers, and those immense spaces that lie beyond our reach and even our imagination: One needs but to do this (continues our author), and explain to him such things as are now known almost to every body; and by it to show, that if the world be not infinite, it is *infinito simili*, and undoubtedly the work of an INFINITE ARCHITECT.

“ But if we would take a view of all the *particulars* contained within that astonishing compass which we have thus hastily run over, how would wonders multiply upon us? Every corner, every part of the world, is as it were made up of *other worlds*. If we look upon this our earth, what scope does it furnish for admiration? The great variety of mountains, hills, valleys, plains, rivers, seas, trees, and plants! The many tribes of different animals with which it is stocked; the multifarious inventions and works of one of these, *i. e.* of us men; with the wonderful instincts of others, guiding them uniformly to what is best for themselves, in situations where neither sense nor reason could direct them. And yet when all these (heaven and earth) are surveyed as nicely as they can be by the help of our unassisted senses and of telescopes, we may discover by the assistance of good microscopes, in very small parts of matter, as many *new* wonders as those already discovered, new kingdoms of animals, with new and curious architecture. So that as our senses and even conception fainted before in the vast journeys we took in considering the expanse of the universe, they here again fail us in our researches into the principles and minute parts

of which it is composed. Both the *beginnings* and the *ends* of things, the *least* and the *greatest*, all conspire to baffle us; and which way soever we prosecute our inquiries, we still meet with fresh subjects of amazement, and fresh reasons to believe that there are indefinitely more and more behind, that will forever escape our eagerest pursuits and deepest penetration.

“ In this vast assemblage, and amidst all the multifarious motions by which the several processes of generation and corruption, and the other phenomena of nature, are carried on, we cannot but observe that there are stated methods, as so many forms of proceeding, to which things punctually and religiously adhere. The same *causes* circumstanced in the same manner produce always the same *effects*; all the *species* of animals among us are made according to one general *idea*; and to are those of *plants* also, and even of *minerals*. No new species are brought forth or have arisen anywhere; and the old are preserved and continued by the *old ways*.

“ It appears, lastly, beyond dispute, that in the parts and model of the world there is a contrivance for accomplishing certain ends. The sun is placed near the centre of our system, for the more convenient dispensing of his benign influences to the planets moving about him; the place of the earth's *equator* intersects that of her *orbit*, and makes a proper angle with it, in order to diversify the *year*, and create an useful variety of *seasons*; and many other things of this kind will be always observed, and though a thousand times repeated, be meditated upon with pleasure by good men and true philosophers. Who can observe the vapours to ascend, especially from the sea, meet above in clouds, and fall again after condensation, without being convinced that this is a kind of *distillation*, in order to clear the water of its grosser salts, and then by rains and dews to supply the fountains and rivers with fresh and wholesome liquor; to nourish the vegetables below by showers, which descend in drops as from a *watering-pot* upon a garden? Who can view the *structure* of a plant or animal, the indefinite number of its fibres and fine vessels, the formation of larger vessels, and the several members out of them, with the apt disposition of all these; the means contrived for the reception and distribution of *nutriment*; the *effect* this nutriment has in extending the vessels, bringing the vegetable or animal to its full growth and expansion, continuing the *motion* of the several fluids, repairing the decays of the body, and preserving *itself*? Who can take notice of the several *faculties* of animals, their arts of saving and providing for themselves, or the ways in which they are provided for; the uses of plants to animals, and of some animals to others, particularly to mankind; the care taken that the several species should be propagated, without confusion, from their proper seeds; the strong inclination planted in animals for that purpose, their love of their young and the like.—Who (says our author) can observe all this, and not see a *design* in such *regular* pieces, so nicely wrought and so admirably preserved? If there were but one animal in existence, and it could not be doubted but that his eyes were formed that he might see with them, his ears that he might hear with them, and his feet to be instruments by which he might remove himself from place to place; if *design* and *contrivance* can be much less doubted, when the same things are repeated in the individuals of all the tribes of animals; if the like observations may be made with respect to vegetables and other things; and if all these *classes* of things, and much more the *individuals* comprehended under them, be inconceivably numerous, as most unquestionably they are — one cannot but be convinced, from what so plainly runs through the nobler parts of the visible world, that not only *they*, but other things, even those that seem to be *less noble*, have their ends likewise, though not always

Being and
attributes
of God.

perceived by capacities limited like ours. And since we cannot with the Epicureans or old, suppose the parts of matter to have *converged* among themselves this wonderful form of a world, to have taken by agreement each its respective *part*, and then to have pursued in conjunction constant ends by certain motions and measures *concerted*, there must be some other Being, whose wisdom and power are equal to such a mighty work as is the *structure and preservation* of the world. There must be some Almighty Mind who modelled and preserves it; lays the causes of things so deep; prescribes them such uniform and steady laws; destines and adapts them to certain purposes; and makes one thing to fit and answer another so as to produce one harmonious whole. Yes,

These are thy glorious works, Parent of good!
Almighty, thine this universal frame,
Thus wondrous fair; THYSELF how wondrous then!

29
Goodness.

How wondrous in wisdom and in power!" But the goodness of God is not less conspicuous in his works than His power or His wisdom. Contrivance proves design, and the predominant tendency of the contrivances indicates the disposition of the designer. "The world (says an elegant and judicious writer†) abounds with contrivances, and all the contrivances in it with which we are acquainted are directed to beneficial purposes. Evil no doubt exists; but it is never that we can perceive the object of contrivance. Teeth are contrived to eat, not to ache; their aching now and then is incidental to the contrivance, perhaps inseparable from it; but it is not its object. This is a distinction which well deserves to be attended to. In describing implements of husbandry, one would hardly say of a sickle that it is made to cut the reaper's fingers, though from the construction of the instrument, and the manner of using it, this mischief often happens. But if he had occasion to describe instruments of torture or execution, this, he would say, is to extend the sinews; this to dislocate the joints; this to break the bones; this to scorch the soles of the feet. Here pain and misery are the very objects of the contrivance. Now nothing of this sort is to be found in the works of nature. We never discover a train of contrivance to bring about an evil purpose. No anatomist ever discovered a system of organization calculated to produce pain and disease; or, in explaining the parts of the human body, ever said, this is to irritate, this to inflame, this duct is to convey the gravel to the kidneys, this gland to secrete the humour which forms the gout. If by chance he come to a part of which he knows not the use, the most that he can say is, that to him it appears to be useless: no one ever suspects that it is put there to incommode, to annoy, or to torment. If God had wished our misery, he might have made sure of his purpose, by forming our senses to be as many fores and pains to us as they are now instruments of gratification and enjoyment; or, by placing us among objects so ill suited to our perceptions as to have continually offended us, instead of ministering to our refreshment and delight. He might have made, for instance, every thing we tasted bitter, every thing we saw loathsome, every thing we touched a sting, every smell a stench, and every sound a discord."

Instead of this, all our sensations, except such as are excited by what is dangerous to our health, are pleasures to us: The view of a landscape is pleasant; the taste of nourishing food is pleasant; sounds not too loud are agreeable, while musical sounds are exquisite; and hardly any smells, except such are excited by effluvia obviously pernicious to the brain, are disagreeable; whilst some of them, if not too long indulged, are delightful. Our lives are preserved and the species is continued by obeying the impulse of appetites;

of which the gratification is exquisite when not repeated too frequently, to answer the purposes of the Author of our being. Since, then, God has called forth his consummate wisdom to contrive and provide for our happiness, and has made those things which are necessary to our existence and the continuance of the race sources of our greatest sensual pleasures, who can doubt but that benevolence is one of his attributes; and that, if it were not impious to draw a comparison between them, it is the attribute in which he himself most delighteth?

But it is not from sensation only that we may infer the benevolence of the Deity: He has formed us with minds capable of intellectual improvement, and he has implanted in the breast of every man a very strong desire of adding to his knowledge. This addition to be sure cannot be made without labour; and at first the requisite labour is to most people irksome: but a very short progress in any study converts what was irksome into a pleasure of the most exalted kind; and he who by study, however intense, enlarges his ideas, and is conscious that he is daily rising in the scale of intelligence, experiences a complacency, which, though not so poignant perhaps as the pleasures of the sensuality, is such as endears him to himself, and is what he would not exchange for any thing else which this world has to bestow, except the still sweeter complacency arising from the consciousness of having discharged his duty.

That the practice of virtue is attended with a peculiar pleasure of the purest kind, is a fact which no man has ever questioned, though the immediate source of that pleasure has been the subject of many disputes. He who attributes it to a moral sense, which instinctively points out to every man his duty, and upon the performance of it rewards him with a sentiment of self-approbation, must of necessity acknowledge benevolence to be one of the attributes of that Being who has so constituted the human mind. That to protect the innocent, relieve the distressed, and do to others as we would in like circumstances wish to be done by, fills the breast, prevails to all reflection, with a holy joy, as the commission of any crime tears it with remorse, cannot indeed be controverted. Many, however, contend, that this joy and this remorse spring not from any moral instinct implanted in the mind, but are the consequence of early and deep-rooted associations of the practice of virtue with the hope of future happiness, and of vice with the dread of future misery. On the respective merits of these two theories we shall not now decide. We have said enough on the subject in other articles (see INSTINCT, MORAL PHILOSOPHY, and PASSION); and shall here only observe, that they both lead with equal certainty to the benevolence of the Deity, who made us capable of forming associations, and subjected those associations to fixed laws. This being the case, the moral sense, with all its instantaneous effects, affords not a clearer or more convincing proof of his goodness, than that principle in our nature by which remote circumstances become so linked together, that, after the connecting ideas have escaped from the mind, the one circumstance never occurs without bringing the other also into view. It is thus that the pleasing complacency, which was perhaps first excited by the hopes of future happiness, comes in time to be so associated with the consciousness of virtuous conduct, the only thing entitled to reward, that a man never performs a meritorious action without experiencing the most exquisite joy diffused over his mind, though his attention at that instant may not be directed either to heaven or futurity. Were we obliged, before we could experience this joy, to estimate by reason the merit of every individual action, and trace its connection to heaven and future happiness through a long train of intermediate argu-

mentation,

Being an
attribut
of God

mentation, we should be in a great measure deprived of the present reward of virtue; and therefore this associating principle contributes much to our happiness. But the benevolence of a Being, who seems as it were thus anxious to furnish us with both sensual and intellectual enjoyments, and who has made our duty our greatest pleasure, cannot be questioned; and therefore we must infer, that the Author of Nature wishes the happiness of the whole sensible and intelligent creation.

To such reasoning as this in support of the Divine Benevolence many objections have been made. Some of them appear at first sight plausible, and are apt to stagger the faith of him who has bestowed no time on the study of that branch of general science which is called *physics* (see *PHYSICS*). To omit these altogether in such an article as this might be construed into neglect; whilst it is certain that there is in them nothing worthy of the attention of that man who is qualified either to estimate their force, or to understand the arguments by which they have often been repelled.

It has been asked, Why, if the Author of Nature be a benevolent Being, are we necessarily subject to pain, diseases, and death? The scientific physiologist replies, Because from these evils Omnipotence itself could not in our present state exempt us, but by a constant series of miracles. He who admits miracles, knows likewise that mankind were originally in a state in which they were not subject to death; and that they fell under its dominion through the fault of their common progenitors. But the fall and restoration of man is the great subject of revealed religion; and at present we are discussing the question like philosophers who have no other data on which to proceed than the phenomena of nature. Now we know, that as all matter is divisible, every system composed of it must necessarily be liable to decay and dissolution; and our material system would decay and be dissolved long before it could serve the purposes of nature, were there not methods contrived with admirable wisdom for repairing the waste occasioned by perpetual friction. The body is furnished with different fluids, which continually circulate through it in proper channels, and leave in their way what is necessary to repair the solids. These again are supplied by food *ab extra*; and to the whole processes of digestion, circulation, and nutrition, the air we breathe is absolutely necessary. (See *PHYSIOLOGY*, Sect. 1, 2, 3, 4, 5). But as the air is a very heterogeneous fluid, and subject to violent and sudden changes, it is obvious that these changes must affect the blood, and by consequence the whole frame of the human body. We see the air indeed in process of time consume even marble itself; and therefore cannot wonder, that as it is in one state the parent of health, it should in another be the source of disease to such creatures as man and other terrestrial animals. Nor could these consequences be avoided without introducing others much more deplorable. The world is governed by general laws, without which there could be among men neither arts nor sciences; and tho' laws different from those by which the system is at present governed might perhaps have been established, there is not the smallest reason to imagine that they could on the whole have been better, or attended with fewer inconveniences. As long as we have material and solid bodies capable of motion, liable to resistance from other solid bodies, supported by food, subject to the agency of the air, and divisible, they must necessarily be liable to pain, disease, corruption, and death, and that too by the very influence of those laws which preserve the order and harmony of the universe. Thus gravitation is a general law so good and so necessary, that were it for a moment suspended, the world would instantly fall to pieces; and yet by means of this law the man

must inevitably be crushed to death upon whom a tower shall chance to tumble. Again, the attraction of cohesion is a general law, without which it does not appear that any corporeal system could possibly exist: it is by this law too, or a modification of it, that the glands and lacteals of the human body extract from the blood such particles as are necessary to nourish the solids; and yet it is by means of the very same modification of the very same law that a man is liable to be poisoned. How are these effects to be prevented?

Shall burning *Ætna*, if a sage requires,
Forget to thunder, and recal her fires?
On air or sea new motions be imprelt,
Oh blameless Bethel! to relieve thy breast:
When the loose mountain trembles from on high
Shall gravitation cease if you go by?
Or some old temple nodding to its fall,
For Charters' head reserve the hanging wall?

Such a perpetual miracle, such a frequent suspending of the laws of nature in particular instances, we cannot doubt to be within the compass of Almighty power: but were this suspension really to take place, mankind would be involved in ignorance greater than that of childhood; for not one of them could know, or have any means of discovering this moment, what was to happen the next; and the consequence would be, that, uncertain but the single motion of a single joint might bring on them sudden destruction, they would all perish in a state of absolute inactivity.

But though the human body could not have been preserved from dangers and dissolution but by introducing evils greater on the whole than those to which it is now liable, why, it has sometimes been asked, is every disorder to which it is subject attended with sickness or with pain? and why is such a horror of death implanted in our breasts, seeing that by the laws of nature death is inevitable? We answer, That sickness, pain, and the dread of death, serve the very best purposes. Could a man be put to death, or have his limbs broken without feeling pain, the human race had long ago been extinct. Felt we no uneasiness in a fever, we should be insensible of the disease, and die before we suspected our health to be impaired. The horror which generally accompanies our reflections on death tends to make us more careful of life, and prevents us from quitting this world rashly when our affairs prosper not according to our fond wishes. It is likewise an indication that our existence does not terminate in this world; for our dread is seldom excited by the prospect of the pain which we may suffer when dying, but by our anxiety concerning what we may be doomed to suffer or enjoy in the next stage of our existence; and this anxiety tends more perhaps than any thing else to make us live while we are here in such a manner as to ensure our happiness hereafter.

Thus from every view that we can take of the works and laws of God, and even from considering the objections which have sometimes been made to them, we are compelled to acknowledge the benevolence of their Author. We must not, however, suppose the Divine benevolence to be a fond and weak affection like that which is called benevolence among men. All human affections and passions originate in our dependence and wants; and it has been doubted whether any of them be at first disinterested (see *PASSION*): but he to whom existence is essential cannot be dependant; he who is the Author of every thing can feel no want. The divine benevolence therefore must be wholly disinterested, and of course free from those partialities originating in self-love, which are alloys in the most sublime of human virtues. The most benevolent man on earth, though he wishes the happiness of

every fellow-creature, has still, from the ties of blood, the endearments of friendship, or, perhaps from a regard to his own interest, some particular favourites whom, on a competition with others, he would certainly prefer. But the equal Lord of all can have no particular favourites. His benevolence is therefore coincident with justice; or, to speak more properly, that which is called *divine justice*, is only benevolence exerting itself in a particular manner for the propagation of general felicity. When God prescribes laws for regulating the conduct of his intelligent creatures, it is not because he can reap any benefit from their obedience to those laws, but because such obedience is necessary to their own happiness; and when he punishes the transgressor, it is not because in his nature there is any disposition to which the prospect of such punishment can afford gratification, but because in the government of free agents punishment is necessary to reform the criminal, and to intimidate others from committing the like crimes. But on this subject we need not dwell. It has been shewn elsewhere (METAPHYSICS, 1^o 312.), that all the moral attributes of God, his HOLINESS, JUSTICE, MERCY, and TRUTH, should be conceived as the same divine BENEVOLENCE, acting in different ways according to different exigencies, but always for the same sublime end—the propagation of the utmost possible happiness.

The substance or essence of this self-existent, all-powerful, infinitely wise, and perfectly good Being, is to us wholly incomprehensible. That it is not matter, is shewn by the process of argumentation by which we have proved it to exist; but what it is we know not, and it would be impious presumption to inquire. It is sufficient for all the purposes of religion to know that God is some how or other present to every part of his works; that existence and every possible perfection is essential to him; and that he wishes the happiness of all his creatures. From these truths we might proceed to prove and illustrate the perpetual superintendance of his providence, both general and particular, over every the minutest part of the universe: but that subject has been discussed in a separate article; to which, therefore, we refer the reader. (See PROVIDENCE). We shall only observe at present, that the manner in which animals are propagated affords as complete a proof of the constant superintendance of divine power and wisdom, as it does of the immediate exertion of these faculties in the formation of the parent pair of each species. For were this business of propagation carried on by *necessary* and mechanical laws, it is obvious, that in every age there would be generated, in each species of animals, the very same proportion of males to females that there was in the age preceding. On the other hand, did generation depend upon *fortuitous* mechanism, it is not conceivable but that, since the beginning of the world, or, according to this hypothesis, during the course of eternity, several species of animals should in *some* age have generated nothing but *males*, and others nothing but *females*; and that of course many species would have been long since extinct. As neither of these cases has ever happened, the preservation of the various species of animals, by keeping up constantly in the world a due, though not always the same, proportion between the sexes of male and female, is a complete proof of the superintendance of divine providence, and of that saying of the apostle, that it is “in God we live, move, and have our being.”

SECT. II. *Of the Duties and Sanctions of Natural Religion.*

FROM the short and very inadequate view that we have taken of the divine perfections, it is evidently our duty to

reverence in our minds the self-existent Being to whom they belong. This is indeed not only a duty, but a duty of which no man who contemplates these perfections, and believes them to be real, can possibly avoid the performance. He who thinks irreverently of the Author of nature, can never have considered seriously the power, the wisdom, and the goodness, displayed in his works; for whoever has a tolerable notion of these must be convinced, that he who performed them has no imperfection; that his power can accomplish every thing, which involves not a contradiction; that his knowledge is intuitive, and free from the possibility of error; and that his goodness extends to all without partiality and without any alloy of selfish design. This conviction must make every man on whose mind it is impressed ready to prostrate himself in the dust before the Author of his being; who, though infinitely exalted above him, is the source of all his enjoyments, constantly watches over him with paternal care, and protects him from numberless dangers. The sense of so many benefits must excite in his mind a sentiment of the liveliest gratitude to him from whom they are received, and an ardent wish for their continuance.

While silent gratitude and devotion thus glow in the breast of the contemplative man, he will be careful not to form even a mental image of that all-perfect Being to whom they are directed. He knows that God is not material; that he exists in a manner altogether incomprehensible; that to frame an image of him would be to assign limits to what is infinite; and that to attempt to form a positive conception of him would be impiously to compare himself with his Maker.

The man who has any tolerable notion of the perfections of the Supreme Being will never speak lightly of him, or make use of his name at all but on great and solemn occasions. He knows that the terms of all languages are inadequate and improper, when applied directly to him who has no equal, and to whom nothing can be compared; and therefore he will employ these terms with caution. When he speaks of his mercy and compassion, he will not consider them as feelings wringing the heart like the mercy and compassion experienced by man, but as rays of pure and disinterested benevolence. When he thinks of the stupendous system of nature, and hears it, perhaps, said that God formed it for his own glory, he will reflect that God is so infinitely exalted above all his creatures, and so perfect in himself, that he can neither take pleasure in their applause, as great men do in the applauses of their fellow-creatures, nor receive any accession of any kind from the existence of ten thousand worlds. The immense fabric of nature therefore only displays the glory or perfections of its Author to *us* and to other *creatures* who have not faculties to comprehend him in himself.

When the contemplative man talks of *servicing* God, he does not dream that his services can increase the divine felicity; but means only that it is his duty to obey the divine laws. Even the pronoun *He*, when it refers to God, cannot be of the same import as when it refers to man; and by the philosophical divine it will seldom be used but with a mental allusion to this obvious distinction.

As the man who duly venerates the Author of his being will not speak of him on trivial occasions, so will he be still further from calling upon him to witness impertinences and falsehood, (see OATH). He will never mention his name but with a *pause*, that he may have time to reflect in silence on his numberless perfections, and on the immense distance between himself and the Being of whom he is speaking. The slightest reflection will convince him that the world with all that it contains depends every moment

upon that God who formed it; and this conviction will compel him to wish for the divine protection of himself and his friends from all dangers and misfortunes. Such a wish is in effect a prayer, and will always be accompanied with adoration, confession, and thanksgiving (see PRAYER). But adoration, confession, application, and thanksgiving, constitute what is called *worship*, and therefore the worship of God is a natural duty. It is the addressing of ourselves as his dependants to him as the supreme cause and governor of the world, with acknowledgments of what we enjoy, and petitions for what we really want, or he knows to be convenient for us. As if, *ex. gr.* I should in some humble and composed manner (says Mr Wallaston) pray to that "Almighty Being, upon whom depends the existence of the world, and by whose providence I have been preserved to this moment, and enjoyed many undeserved advantages, that he would graciously accept my grateful sense and acknowledgments of all his beneficence towards me; that he would deliver me from the evil consequences of all my transgressions and follies; that he would endue me with such dispositions and powers as may carry me innocently and safely through all future trials, and may enable me on all occasions to behave myself conformably to the laws of reason piously and wisely; that He would suffer no being to injure me, no misfortunes to befall me, nor me to hurt myself by any error or misconduct of my own; that he would vouchsafe me clear and distinct perceptions of things; with so much health and prosperity as may be good for me; that I may at least pass my time in peace, with contentment and tranquillity of mind; and that having faithfully discharged my duty to my family and friends, and endeavoured to improve myself in virtuous habits and useful knowledge, I may at last make a decent and happy exit, and find myself in some better state."

That an untaught savage would be prompted by *instinct* to address the Supreme Being in such terms as this, we are so far from thinking, that to us it appears not probable that such a savage, in a state of solitude, would be led by instinct to suppose the existence of that Being. But as soon as the being and attributes of God were, by whatever means, made known unto man, every sentiment expressed in this prayer must necessarily have been generated in his mind; for not to be sensible that we derive our existence and all our enjoyments from God, is in effect to deny his being or his providence; and not to feel a wish that he would give us what we want, is to deny either his goodness or his power.

The worship of God therefore is a natural duty resulting from the contemplation of his attributes and a sense of our own dependence. But the reasoning which has led us to this conclusion respects only *private devotion*; for it is a question of much greater difficulty, and far enough from being yet determined, whether *public worship* be a duty of that religion which can with any propriety be termed *natural*. Mr Wallaston indeed positively affirms that it is, and endeavours to prove his position by the following arguments.

"A man (says he) may be considered as a member of some society; and as *such* he ought to worship God if he has the opportunity of doing it, if there be proper prayers used publicly which he may resort to, and if his health, &c. permit. Or the society may be considered as *one body*, that has common interests and concerns, and as *such* is obliged to worship the Deity, and offer one prayer. Besides, there are many who know not of themselves how to pray; perhaps cannot so much as read. These must be taken as they are; and consequently some time and place appointed where they may

have suitable prayers read to them, and be guided in their devotions. And further, towards the keeping mankind in order, it is *necessary* there should be some religion professed, and even established, which cannot be without public worship. And were it not for that sense of virtue which is *principally* preserved (so far as it is preserved) by national *forms and habits* of religion, men would soon lose it *and*, run wild, prey upon one another, and do what else the worst of savages do."

These are in themselves just observations, and would come with great force and propriety from the tongue or pen of a Christian preacher, who is taught by revelation that the Master whom he serves has commanded his followers "not to forsake the assembling of themselves together;" and has promised, "that if two of them shall agree on earth as touching any thing that they shall ask, it shall be done for them of his Father who is in heaven." As urged by such a man and on such grounds, they would serve to show the fitness of the divine command, and to point out the benefits which a religious obedience to it might give us reason to expect. But the author is here professing to treat of *natural religion*, and to state the duties which result from the mere relation which subsists between man as a creature and God as his creator and constant preserver. Now, though we readily admit the benefits of public worship as experienced under the Christian dispensation, we do not perceive any thing in this reasoning which could lead a pious thief to expect the same benefit previous to all experience. When the author thought of *national forms and establishments of religion*, he certainly lost sight of his proper subject, and, as such writers are too apt to do, comprehended under the religion of nature what belongs only to that which is revealed. Natural religion, in the proper sense of the words, admits of no particular *forms*, and of no *legal establishment*. Private devotion is obviously one of its duties, because sentiments of adoration, confession, supplication, and thanksgiving, necessarily spring up in the breast of every man who has just notions of God and of himself: but it is not so obvious that such notions would induce any body of men to meet at *stated times* for the purpose of expressing their devotional sentiments in public. Mankind are indeed social beings, and naturally communicate their sentiments to each other; but we cannot conceive what should at first have led them to think that public worship at *stated times* would be acceptable to the self-existent Author of the universe. In case of a famine, or any other calamity in which the whole tribe was equally involved, they might speak of it to each other, inquire into its cause, and in the extremity of their distress join perhaps in one fervent petition, that God would remove it. In the same manner they might be prompted to pour forth occasional ejaculations of public gratitude for public mercies; but it does not follow from these incidental occurrences that they would be led to institute times and places and forms of national worship, as if they believed the omnipotent Deity more ready to hear them in public than in private. That the appointment of such times and forms and places is beneficial to society, experience teaches us; and therefore it is the duty, and has been the practice, of the supreme magistracy in every age and in every civilized country to provide for the maintenance of the national worship. But this practice has taken its rise, not from the deductions of reason, but either from direct revelation, as among the Jews and Christians; or from tradition, which had its origin in some early revelation, as among the more enlightened Pagans of ancient and modern times.

We hope that none of our readers will be so unjust as to suppose that by this disquisition we mean, in any degree, to

call in question the fitness or the duty of public worship. This is so far from our intention, that we firmly believe with Mr Wollaston, that what piety remains among us is to be attributed in a great measure to the practice of frequenting the church on Sundays; and that it is the neglect of this particular duty which has rendered the present generation of men less pious, less humble, and more prone to faction, than their fathers were, who made it a point every Lord's day to unite with some congregation of Christians in the public worship of their Creator and Redeemer. But whilst we are convinced of the importance and necessity of this too much neglected duty, and could wish to impress our conviction upon the minds of all our readers, we do not apprehend that we lessen its dignity, or detract from the weight of almost universal practice, by endeavouring to derive that practice from its true source, which appears to us to be not human reason, but divine revelation.

44
The practice of virtue a duty of natural religion.

But whatever doubts may be entertained with respect to the origin of public worship, there can be none as to the foundation of moral virtue. Reason clearly perceives it to be the will of our Maker, that every individual of the human race should treat every other individual as, in similar circumstances, he could justly expect to be treated himself. It is thus only that the greatest sum of human happiness can be produced (see MORAL PHILOSOPHY, n^o 17. and 135.); for were all men temperate, sober, just in their dealings, faithful to their promises, and charitable to the poor, &c. it is obvious that no miseries would be felt upon earth, but the few which, by the laws of corporeal nature, unavoidably result from the union of our minds with systems of matter. But it has been already shown, that the design of God in forming sentient beings was to communicate to them some portion, or rather some resemblance, of that felicity which is essential to himself; and therefore every action which in its natural tendency co-operates with this design must be agreeable to him, as every action of a contrary tendency must be disagreeable.

45
Cruelty to the inferior animals a sin.

From this reasoning it follows undeniably, that we are obliged not only to be just and beneficent to one another, but also to abstain from all unnecessary cruelty to inferior animals. That we have a right to tame cattle, and employ them for the purposes of agriculture and other arts where strength is required, is a position which we believe has never been controverted. But it is the intention of God to communicate, in different degrees according to their different ranks, a portion of happiness to all his creatures endowed with sense, it is obvious that we sin against him when we subject even the horse or the ass to greater labour than he is able to perform; and this sin is aggravated when from avarice we give not the animal a sufficient quantity of food to support him under the exertions which we compel him to make. That it is our duty to defend ourselves and our property from the ravages of beasts of prey, and that we may even exterminate such beasts from the country in which we live, are truths which cannot be questioned; but it has been the opinion of men, eminent for wisdom and learning, that we have no right to kill an ox or a sheep for food, but in consequence of the divine permission to Noah recorded in the ninth chapter of the book of Genesis. Whether this opinion be well or ill founded we shall not positively determine, though the arguments upon which it is made to rest are of such a nature as the fashionable reasoners of the present day would perhaps find it no easy task to answer; but it cannot admit of a doubt, that, in killing such animals, we are, in duty to *their* Creator and *ours*, bound to put them to the least possible pain. If this be granted, and we do not see how it can be denied by any man convinced of

the benevolence of the Deity, it is still more evident that we act contrary to the divine will when, for our mere amusement, we torture and put to death such animals as are confessedly not injurious to ourselves, or to any thing upon which the comforts of life are known to depend. We are indeed far from being convinced with the poet, that insects and reptiles "in mortal tufferance feel as when a giant dies," (see PLEASURE and PHYSIOLOGY, Sect. viii.); but their feelings on that occasion are certainly such, as that, when we wantonly inflict them, we thwart, as far as in our power, the benevolent purpose of the Creator in giving them life and sense. Let it be observed too, that the man who practises needless cruelty to the brute creation is training up his mind for exercising cruelty towards his fellow-creatures, to his slaves if he have any, and to his servants; and by a very quick progress to all who may be placed beneath him in the scale of society.

Such are the plain duties of natural religion: and if they were universally practised, it is self-evident that they would be productive of the greatest happiness which mankind could enjoy in this world, and that piety and virtue would be their own reward. They are however far from being universally practised; and the consequence is, that men are frequently raised to affluence and power by vice, and sometimes sunk into poverty by a rigid adherence to the rules of virtue.

This being the case, there can be no question of greater importance, while there are few more difficult to be answered, than "What are the sanctions by which natural religion enforces obedience to her own laws?" It is not to be supposed that the great body of mankind should, without the prospect of an ample reward, practise virtue in those instances in which such practice would be obviously attended with injury to themselves; nor does it appear reasonable in any man to forego present enjoyment, without the well-grounded hope of thereby securing to himself a greater or more permanent enjoyment in reversion. Natural religion therefore, as a system of doctrines influencing the conduct, is exceedingly defective, unless it affords sufficient evidence, intelligible to every ordinary capacity, of the immortality of the soul, or at least of a future state of rewards and punishments. That it *does* afford this evidence, is strenuously maintained by some deists, and by many philosophers of a different description, who, though they profess Christianity, seem to have some unaccountable dread of being deceived by their bibles in every doctrine which cannot be proved by the additional buttresses of philosophical reasoning.

One great argument made use of to prove that the immortality of the soul is among the doctrines of natural religion, is the universal belief of all ages and nations that men continue to live in some other state after death has separated their souls from their bodies. "Quod si omnium consensus natura vox est: omnesque, qui ubique sunt, consentiunt esse aliquid, quod ad eos pertineat, qui vita cesserint: nobis quoque idem existimandum est: et si, quorum aut ingenio, aut virtute animus excellit, eos arbitramur, quia natura optima sunt, cernere natura vim maxime: verisimile est, cum optimus quisque maxime posteritati serviat, esse aliquid, cujus est post mortem sensum sit, habiturus. Sed ut deos esse natura opinamur, qualesque sint, ratione cognoscimus, sic permanere animos arbitramur consensu nationum omnium." * Cicero

That this is a good argument for the truth of the doctrine, through whatever channel men may have received it, we readily acknowledge; but it appears not to us to be any proof of that doctrine's being the deduction of human reasoning. The popular belief of Paganism, both ancient and modern, is so fantastic and absurd, that it could never have

49
Not the nature.

been rationally inferred from what nature teaches of God and the soul. In the Elysium of the Greek and Roman poets, departed spirits were visible to mortal eyes; and must therefore have been clothed with some material vehicle of sufficient density to reflect the rays of light, though not to resist the human touch. In the mythology of the northern nations, as deceased heroes are represented as eating and drinking, they could not be considered as entirely divested of matter; and in every popular creed of idolatry, future rewards were supposed to be conferred, not for private virtue, but for public valence, upon heroes and conquerors and the destroyers of nations. Surely no admirer of what is now called natural religion will pretend that these are part of its doctrines; they are evidently the remains of some primeval tradition obscured and corrupted in its long progress through ages and nations.

The philosophers of Greece and Rome, despising the popular mythology of their respective countries, employed much time and great talents in disquisitions concerning the human soul and the probability of a future state; and if the genuine conclusions of natural religion on this subject are anywhere to be found, one would naturally look for them in the writings of those men whose genius and virtues did honour to human nature. Yet it is a fact which cannot be controverted, that the philosophers held such notions concerning the substance of the soul and its state after death as could afford no rational support to suffering virtue. (see METAPHYSICS, Part III. chap. 4). Socrates is indeed an exception. Confining himself to the study of ethics, and despising those metaphysical subtleties with which so many others had bewildered themselves, that excellent person inferred by the common moral arguments (see MORAL PHILOSOPHY, p. 232—246), that the reality of a future state of rewards and punishments is in the highest degree probable. He was not, however, at all times absolutely convinced of this important truth; for a little before his death he said to some who were about him, "I am now about to leave this world, and ye are still to continue in it; which of us have the better part allotted us, God only knows*." And again, at the end of his most admired discourse concerning the immortality of the soul, delivered at a time when he must have been serious, he said to his friends who came to pay their last visit, "I would have you to know that I have great hopes that I am now going into the company of good men; yet I would not be too peremptory and confident concerning it †."

Next to Socrates, Cicero was perhaps the most respectable of all the philosophers of antiquity; and he seems to have studied this great question with uncommon care: yet what were his conclusions? After retailing the opinions of various sages of Greece, and showing that some held the soul to be the heart; others, the blood in the heart; some, the brain; others, the breath; one, that it was harmony; another, that it was number; one, that it was nothing at all; and another, that it was a certain quintessence without a name, but which might properly be called *quintessence*—he gravely adds, "Harum sententiarum quæ vera sit, Deus aliquis viderit: quæ verisimilima, magna questio est †." He then proceeds to give his own opinion; which, as we have shown elsewhere, was, that the soul is part of God.

To us who know by other evidence that the soul is immortal, and that there will be a future state in which all the obliquities of the present shall be made straight, the argument drawn from the moral attributes of God, and the unequal distribution of the good things of this life, appears to have the force of demonstration. Yet none of us will surely pretend to say that his powers of reasoning are greater

than were those of Socrates and Cicero: and therefore the probability is, that had we been like them destitute of the light of revelation, we should have been disturbed by the same doubts, and have said with the latter, upon reading the arguments of the former as detailed by Plato, "Nescio quomodo, dum lego, assentior: cum posui librum, et mecum ipse de immortalitate animarum cœpi cogitare, assensio illa elabitur †."

No one, we hope, will suspect us of an impious attempt to weaken the evidence of a future state, God forbid! The expectation of that state is the only support of virtue and religion; and we think the arguments which we have stated elsewhere, and referred to on the present occasion, make the reality of it so highly probable, that, though there were no other evidence, he would act a very foolish part who should confine his attention wholly to the present life. But we do not apprehend that we can injure the cause either of virtue or of religion, by confessing, that those arguments which left doubts in the minds of Socrates and Cicero appear not to us to have the force of complete demonstration of that life and immortality which our Saviour brought to light through the gospel.

Were the case, however, otherwise: were the arguments which the light of nature affords for the immortality of the human soul as absolutely convincing as any geometrical demonstration—natural religion would still be defective; because it points out no method by which such as have offended God may be certainly restored to his favour, and to the hopes of happiness which by their sin they had lost. The he who knows whereof we are made would show himself placable to sinners, and that he would find some way to be reconciled, might perhaps be reasonably inferred from the consideration of his benevolence displayed in his works. But when we come to inquire more particularly how we are to be reconciled, and whether a *precipitation* will be required, nature stops short, and expects with impatience the aid of some particular revelation. That God will receive returning sinners, and accept of repentance instead of perfect obedience, cannot be certainly known by those to whom he has not declared that he will. For though repentance be the most probable, and indeed the only means of reconciliation which nature suggests; yet whether he, who is of purer eyes than to behold iniquity, will not require something further before he restore sinners to the privileges which they have forfeited, mere human reason has no way of discovering. From nature therefore arises no sufficient comfort to sinners, but anxious and endless solicitude about the means of appeasing the Deity. Hence those divers ways of sacrificing, and those numberless superstitions which overspread the heathen world, but which were so little satisfactory to the wiser part of mankind, that, even in those days of darkness, the philosophers frequently declared that, in their opinion, those rites and oblations could avail nothing towards appeasing the wrath of an offended God, or making their prayers acceptable to him. Hence Socrates and one of his disciples are represented by Plato † as expecting a person divinely commissioned to inform them whether sacrifices be acceptable to the Deity, and as resolving to offer no more till that person's arrival, which they piously hoped might be at no great distance.

This darkness of the pagan world, which the best of men who lived under it so pathetically deplored, is to us who live under the sunshine of the gospel happily removed by the various revelations contained in the scriptures of the Old and New Testaments. These taken together, and in the order in which they were given, exhibit such a display of providence, such a system of doctrines, and such precepts of practical

Duties and functions of natural religion.

practical wisdom, as the ingenuity of man could never have discovered. The Christian, with the scriptures in his hands, can regulate his conduct by an infallible guide, and rest his

hopes on the surest foundation. These scriptures it is now our business to examine.

Duties of nature of religion

PART II. OF REVEALED THEOLOGY.

Many pre-
tensions to
revelation.

IN every civilized country the popular system of theology has claimed its origin from divine revelation. The Pagans of antiquity had their augurs and oracles; the Chinese have their inspired teachers Confucius and Fohi; the Hindus have their sacred books derived from Brahma; the followers of Mahomet have their koran dictated by an angel; and the Jews and Christians have the scriptures of the Old and New Testaments, which they believe to have been written by holy men of old, who spake and wrote as they were moved by the Holy Ghost.

55
Though
the Jewish
and Chri-
stian reve-
lations are
the same true.

That the claims of ancient Paganism to a theology derived from heaven, as well as the similar claims of the Chinese, Hindus, and Mahometans, are ill founded, has been shown in various articles of this work, (see CHINA, HINDOSTAN, MAHOMETANISM, MYTHOLOGY, and POLYTHEISM); whilst, under the words RELIGION, REVELATION, and SCRIPTURE, we have sufficiently proved the divine inspiration of the Jewish and Christian scriptures, and of course the divine origin of Jewish and Christian theology. These indeed are not two systems of theology, but parts of one system which was gradually revealed as men were able to receive it; and therefore both scriptures must be studied by the Christian divine.

There is nothing in the sacred volume which it is not of importance that he should understand whose office it is to be a teacher of religion; for the whole proceeds from the fountain of truth: but some of its doctrines are much more important than others, as relating immediately to man's everlasting happiness; and these it has been customary to arrange and digest into regular systems, called *bodies* or *institutions of Christian theology*. Could these artificial systems be formed with perfect impartiality, they would undoubtedly be useful, for the bible contains many historical details, but remotely related to human salvation; and even of its most important truths, it requires more time and attention than the majority of Christians have to bestow, to discover the mutual connection and dependence.

56
Common
divisions of
revealed
theology.

Artificial systems of theology are commonly divided into two great parts, the *theoretic* and the *practical*; and these again are subdivided into many inferior branches. Under the theoretic part are sometimes classed,

1. *Dogmatic* theology; which comprehends an entire system of all the dogmas or tenets which a Christian is bound to believe and profess. The truth of these the divine must clearly perceive, and be able to enforce upon his audience: and hence the necessity of studying what is called,

2. The *exegetis*, or the art of attaining the true sense of the holy scriptures; and,

3. *Hermetic* theology, or the art of interpreting and explaining the scriptures to others; an art or which no man can be ignorant who knows how to attain the true sense of them himself.

4. *Polemical* theology, or controversy; and,

5. *Moral* theology, which is distinguished from moral philosophy, or the simple doctrine of ethics, by teaching a much higher degree of moral perfection than the mere light of reason could ever have discovered, and adding new motives to the practice of virtue.

The practical sciences of the divine are,

1. *Homiletic*, or *pulpit* theology; which teaches him to adapt his discourses from the pulpit to the capacity of his

hearers, and to pursue the best methods of guiding them by his doctrine and example in the way of salvation.

2. *Catechetical* theology, or the art of teaching youth and ignorant persons the principal points of evangelical doctrine, as well with regard to belief as to practice.

3. *Casualistic* theology, or the science which decides on doubtful cases of moral theology, and that calms the scruples of conscience which arise in the Christian's soul during his journey through the present world

We have mentioned these divisions and subdivisions of the science of theology, not because we think them important, but merely that our readers may be at no loss to understand the terms when they meet with them in other works. Of such terms we shall ourselves make no use, for the greater part of them indicate distinctions where there is no difference, and tend only to perplex the student. As the truths of Christianity are all contained in the scriptures of the Old and New Testaments, it is obvious that dogmatic theology must comprehend the speculative part of that which is called moral, as well as every doctrine about which controversy can be of importance. But no man can extract a single dogma from the bible but by the practice of what is here called the *exegetis*; so that all the subdivisions of this arrangement of theoretical theology must be studied together as they necessarily coalesce into one. The same thing is true of the three branches into which practical theology is here divided. He who has acquired the art of adapting his homilies to the various capacities of a mixed audience, will need no new study to fit him for instructing children, and the most ignorant persons who are capable of instruction; and the complete master of moral theology will find it no very difficult task to resolve all the cases of conscience which he can have reason to suppose will ever be submitted to his judgment. For these reasons we shall not, in the short summary which our limits permit us to give, trouble either ourselves or our readers with the various divisions and subdivisions of theology. Our preliminary directions will show them how we think the science should be studied: and all that we have to do as *system-builders*, a title of which we are far from being ambitious, is to lay before them the view which the scriptures present to us of the being and perfections of God, his various dispensations to man, and the duties thence incumbent upon Christians. In doing this, we shall follow the order of the divine dispensations as we find them recorded in the Old and New Testaments, dwelling longest upon those which appear to us of most general importance. But as we take it for granted that every reader of this article will have previously read the whole sacred volume, we shall not scruple to illustrate dogmas contained in the Old Testament by texts taken from the New, or to confirm doctrines peculiar to the Christian religion by the testimony of Jewish prophets.

SECT. I. Of God and his Attributes.

IN every system of theology the first truths to be believed are those which relate to the being and attributes of God. The Jewish lawgiver, therefore, who records the earliest revelations that were made to man, begins his history with a display of the power and wisdom of God in the creation of the world. He does not inform his countrymen,

God and his attributes.

men, and expect them to believe, upon the authority of his divine commission, that God exists; for he well knew that the being of God must be admitted, and tolerably just notions entertained of his attributes, before man can be required to pay any regard to miracles which afford the only evidence of a primary revelation: "In the beginning (says he) God created the heavens and the earth." Here the being of God is assumed as a truth universally received; but the sentence, short as it is, reveals another which, as we shall afterwards shew, human reason could never have discovered.

59 Extraordinary denomination of the Supreme Being in the book of Genesis

It will however be proper, before we consider the creation of the world, and compare what the scriptures say of it with the opinions of the most enlightened ancients on the same subject, to attend to the appellation which is here given to God; and inquire what light is thrown upon it by subsequent revelations. The passage in the original is בראשית ברא אלהים, where it is remarkable that the Creator is denominated by a noun in the plural number, signifying literally "persons under the obligation of an oath to perform certain conditions." This is certainly a very extraordinary denomination for the one supreme and self-existent Being; and what adds to the strangeness of the phraseology is, that the verb with which this plural noun is made to agree is put in the singular number. What now could be the sacred historian's motive for expressing himself in this manner? His style is in general remarkable for its plainness and grammatical accuracy; and we believe it would be difficult to find in all his five books a single phrase not relating to the Supreme Being in which there appears such a violation of concord.

In answer to this question, it has been said, that Moses uses the plural noun to express in a magnificent way the majesty of God, just as it is customary for kings and earthly potentates, when publishing edicts and laws, to call themselves *we* and *us*. But there is no evidence on record that such a mode of speaking was introduced among kings at a period so early as the era of Moses. Pharaoh was probably as mighty a potentate as any who then reigned upon the earth; but though he is often mentioned by the same sacred historian as issuing edicts with royal authority, he is nowhere represented as speaking of himself in the plural number. Let it be observed, too, that whenever this phraseology was introduced among men, the plural noun was in every grammatical tongue joined to a plural verb; whereas Moses not only puts the noun and the verb in different numbers in the verse under consideration, but afterwards represents the אלהים as saying, "let us make man in our image;" and, "behold the man is become *one of us*." Such phrases as these last were never used by a single man, and therefore cannot have been borrowed from human idioms.

Do they then denote a plurality of gods? No; there is nothing which the scriptures more frequently or more earnestly inculcate than the unity of the divine nature. The texts asserting this great and fundamental truth are almost numberless. "Unto thee (says Moses to his countrymen †) it was shewed, that thou mightest know that the Lord is God; there is none else besides him. Know therefore that the Lord he is God in heaven above and upon the earth beneath: there is none else. And again, "Hear, O Israel, the Lord our God is one Lord," or, as it is expressed in the original, "Jehovah our God is one Jehovah," one Being to whom existence is essential, who could not have a beginning and cannot have an end. In the prophecies of Isaiah, God is introduced as repeatedly declaring ‡, "I am Jehovah, and there is none else; there is no God besides me; that they may know from the rising of the sun and from the west, that there is none besides me: I am Jehovah, and there is none else; Vol. XVIII. Part II.

Is there a God besides me? Yea there is no God; I know not any." In perfect harmony with these declarations of Moses and the prophets, our Saviour, addressing himself to his Father, says §, "This is life eternal, that they might know Thee, the only true God, and Jesus Christ whom Thou hast sent;" and St Paul, who derived his doctrine from his divine Master, affirms ||, that "an idol is nothing in the world; and that there is none other God but one."

The unity of the divine nature, which, from the order and harmony of the world, appears probable to human reason, these texts of revelation put beyond a doubt. Hence the first precept of the Jewish law, and, according to their own writers, the foundation of their whole religion, was, "Thou shalt have none other gods before Me." Hence, too, the reason of that strict command to Jews and Christians to give divine worship to none but God: "Thou shalt worship the Lord thy God, and him only shalt thou serve;" because he is God alone. Him only must we fear, because he alone hath infinite power; in him alone must we trust, because "he only is our rock and our salvation;" and to him alone must we direct our devotions, because "he only knoweth the hearts of the children of men."

It is past dispute, then, that the word אלהים does not indicate a plurality of gods. In the opinion, however, of many eminent divines, it denotes, by its junction with the singular verb, a plurality of persons in the one Godhead; and some few have contended, that by means of this peculiar construction, the Christian doctrine of the Trinity may be proved from the first chapter of the book of Genesis. To this latter opinion we can by no means give our assent. That there are three distinct persons in the one divine nature may be interred with sufficient evidence from a multitude of passages in the Old and New Testaments diligently compared together; but it would perhaps be rash to rest the proof of so sublime a mystery upon any single text of holy scripture, and would certainly be so to rest it upon the text in question. That Moses was acquainted with this doctrine, we, to whom it has been explicitly revealed, may reasonably conclude from his so frequently making a plural name of God to agree with a verb in the singular number; but had we not possessed the brighter light of the New Testament to guide us, we should never have thought of drawing such an inference. For supposing the word אלהים to denote clearly a plurality of persons, and that it cannot possibly signify any thing else, how could we have known that the number is neither more nor less than three, had it not been ascertained to us by subsequent revelations?

There are indeed various passages in the Old Testament, of the phraseology of which no rational account can be given, but that they indicate more than one person in the Godhead. Such are those texts already noticed; "and the Lord God said, let us make man in our image, after our likeness;" and "the Lord God said, behold the man is become like one of us." To these may be added the following, which are to us perfectly unintelligible upon any other supposition; "and the Lord God said, let us go down, and there confound their language †." "If I be a Master (in the Hebrew *adonim*, MASTERS), where is my fear ‡?" "The fear of the Lord (JEHOVAH) is the beginning of wisdom, and the knowledge of the Holy (in the Hebrew *holy ones*) is understanding §." "Remember thy Creator (Hebrew, thy CREATORS) in the days of thy youth *." "And now the Lord God and his Spirit hath sent me §." "Seek ye out of the book of the Lord and read; for my mouth it hath commanded, and his Spirit it hath gathered them ¶." "That these texts imply a plurality of divine persons, seems to us incontrovertible. It has been already observed, that when Moses represents God as saying, let us

Isa. xlv. 12

make man, the majesty of the plural number had not been adopted by earthly sovereigns; and it is obvious that the Supreme Being could not, as has been absurdly supposed, call upon angels to make man; for in different places of scripture the creation is attributed to God alone. Hence it is that Solomon speaks of Creators in the plural number, though he meant only the one Supreme Being, and exhorts men to remember them in the days of their youth. In the passage first quoted from Isaiah, there is a distinction made between the Lord God and his Spirit; and in the other, three living persons are introduced, viz. the Speaker, the Lord, and the Spirit of the Lord. It does not, however, appear evident from these passages, or from any other that we recollect in the Old Testament, that the persons in Deity are three and no more; but no sober Christian will harbour a doubt but that the precise number was by some means or other made known to the ancient Hebrews; for inquiries leading to it would be naturally suggested by the form in which the high priest was commanded to bless the people. "The Lord bless thee and keep thee. The Lord make his face to shine upon thee, and be gracious unto thee. The Lord lift up his countenance upon thee, and give thee peace." †

Numb. vi. 24, 25, 26.

Of this benediction it has been well observed, that if its three articles be attentively considered, they will be found to agree respectively to the three persons taken in the usual order of the FATHER, the SON, and the HOLY GHOST. The Father is the author of blessing and preservation. Grace and illumination are from the Son, by whom we have "the light of the knowledge of the glory of God, in the face of Jesus Christ." Peace is the gift of the Spirit, whose name is the Comforter, and whose first and best fruit is the work of peace (1).

67
A Trinity in unity the doctrine of scripture.

Similar to this benediction, but much more explicit, is the form of Christian baptism; which, to us who live under the sunshine of the gospel, establishes the truth of the doctrine of the Trinity beyond all reasonable ground of dispute. "Go (says our blessed Saviour) and teach all nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghost." What was it the apostles, in obedience to this command, were to teach all nations? Was it not to turn from their vanities to the living God; to renounce their idols and false gods, and so to be baptized in the name of the Father, and of the Son, and of the Holy Ghost? What now must occur to the Gentile nations upon this occasion, but that, instead of all their deities, to whom they had before bowed down, they were in future to serve, worship, and adore, Father, Son, and Holy Ghost, as the only true and living God? To suppose that God and two creatures are here joined together in the solemn rite by which men were to be admitted into a new religion, which directly condemns all creature-worship, would be so extravagantly unreasonable, that we are persuaded such a supposition never was made by any converted Polytheist of antiquity. The nations were to be baptized in the name of three persons, in the same manner, and therefore, doubtless, in the same sense. It is not said in the name of God and his two faithful servants; nor in the name of GOD, and

CHRIST, and the HOLY GHOST, which might have suggested a thought that one only of the three is God; but in the name of the FATHER, and of the SON, and of the HOLY GHOST. Whatever honour, reverence, or regard, is paid to the first person in this solemn rite, the same we cannot but suppose paid to all three. Is he acknowledged as the object of worship? So are the other two likewise. Is he God and Lord over us? So are they. Are we enrolled as subjects, servants, and soldiers, under him? So are we equally under all. Are we hereby regenerated and made the temple of the Father? So are we likewise of the Son and Holy Ghost. "We will come (says our Saviour) and make our abode with him."

John xiv. 23.

If those who believe the inspiration of the scriptures could require any further proof that the Godhead comprehends a Trinity of persons in one nature, we might urge upon them the apostolical form of benediction; "The grace of our Lord Jesus Christ, and the love of God, and the communion of the HOLY GHOST, be with you all." † 2 Cor. xiii. 14. in the same sentence, and in the most solemn manner, recommended his Corinthian converts to the love of God, and to the grace and communion of two creatures? We should think it very absurd to recommend a man at once to the favour of a king and a beggar; but how infinitely small is the distance between the greatest earthly potentate and the meanest beggar when compared with that which must for ever subsist between the Almighty Creator of heaven and earth and the most elevated creature?

But how, it will be asked, can three divine persons be but one and the same God? This is a question which has been often put, but which, we believe, no created being can fully answer. The divine nature and its manner of existence is, to us, wholly incomprehensible; and we might with greater reason attempt to weigh the mountains in a pair of scales, than by our limited faculties to fathom the depths of infinity. The Supreme Being is present in power to every portion of space, and yet it is demonstrable, that in his essence he is not extended (see METAPHYSICS, n^o 309, 310). Both these truths, his inextension and omnipresence, are fundamental principles in what is called natural religion; and when taken together they form, in the opinion of most people, a mystery as incomprehensible as that of the Trinity in unity. Indeed there is nothing of which it is more difficult for us to form a distinct notion than unity simple, and absolutely indivisible; and we are persuaded that such of our readers as have been accustomed to turn their thoughts inwards, and reflect upon the operations of their own minds, will acknowledge the difficulty is not much less to them. Though the Trinity in unity, therefore, were no Christian doctrine, mysteries must still be believed; for they are as inseparable from the religion of nature as from that of revelation; and atheism involves the most incomprehensible of all mysteries, even the forming of existence without a cause. We must indeed begin the best notions that we can of this and of all other mysteries; for if we have no notions whatever of a Trinity in unity, we can neither believe

62
Difficulties in this doctrine.

no

(1) Petrus Alphonso, an eminent Jew, converted in the beginning of the 12th century, and presented to the throne by Alphonsus a king of Spain, wrote a learned treatise against the Jews, wherein he presses them with this scripture, as a plain argument that there are three persons to whom the great and incommunicable name of Jehovah is applied. And even the unconverted Jews, according to Bechai, one of their Rabbies, have a tradition, that when the high-priest pronounced this blessing over the people—*elevatione manuum sic digitos composuit, ut Triada exprimerent*, "he lifted up his hands, and disposed his fingers into such a form as to express a Trinity." All the foundation there is for this in the scripture, is Lev. ix. 22. As for the rest, be it a matter of fact or not, yet if we consider whence it comes, there is something very remarkable in it. See *Observ. Jos. de voif. in Pug. Fid. p. 400, 556, 557.*

God and his attributes.

nor disbelieve that doctrine. It is however to be remembered, that all our notions of God are more or less analogical; that they must be expressed in words which, literally interpreted, are applicable only to man; and that propositions understood in this literal sense may involve an apparent contradiction, from which the truth meant to be expressed by them would be seen to be free, had we direct and adequate conceptions of the divine nature. On this account it is to be wished that men treating of the mystery of the holy Trinity, had always expressed themselves in scripture language, and never aimed at being wise beyond what is written; but since they have acted otherwise, we must, in justice to our readers, advert upon one or two statements of this doctrine, which we have reason to believe are earnestly contended for by some who consider themselves as the only orthodox.

In the scriptures, the three persons are denominated by the terms FATHER, SON, and HOLY GHOST, or by GOD, the WORD, who is also declared to be God, and the SPIRIT OF GOD. It each be truly God, it is obvious that they must all have the same divine nature, just as every man has the same human nature with every other man; and if there be but ONE GOD, it is equally obvious that they must be of the same individual substance or essence, which no three men can possibly be. In this there is a difficulty; but, as will be seen by and by, there is no contradiction. The very terms FATHER and SON imply such a relation between the two persons so denominated, as that though they are of the same substance, possessed of the same attributes, and equally God, just as a human father and his son are equally men, yet the second must be personally subordinate to the first. In like manner, the HOLY GHOST, who is called the Spirit of God, and is said to proceed from the Father, and to be sent by the Son, must be conceived as subordinate to both, much in the same way as a son is subordinate to his parents, tho' possessed of equal or even of superior powers. That this is the true doctrine, appears to us undeniable from the words of our Saviour himself, who, in a prayer addressed to his Father, styles him by way of pre-eminence, "the only true God," as being the fountain or origin of the Godhead from which the Son and the Holy Ghost derive their true divinity. In like manner, St Paul, when opposing the polytheism of the Greeks, says expressly †, that "to us there is but one God, THE FATHER, of whom are all things, and we in, or for, him; and one LORD JESUS CHRIST, BY whom are all things, and we by him."

That the primitive fathers of the Christian church maintained this subordination of the second and third persons of the blessed Trinity to the first, has been evinced with such complete evidence by bishop Bull. that we do not perceive how any man can read his works and entertain a doubt on the subject. We shall transcribe two quotations from him, and refer the reader for fuller satisfaction to sect. 4. of his *Defensio fidei Niene.* The first shall be a passage cited from *Novatian*, or whoever is the author of the book on the Trinity published among the works of Tertullian, in which the learned prelate assures us the sense of all the ancients is expressed. "Quia quid est Filius, non ex se est, quia nec innatus est; sed ex patre est, quia genitus est: sine dum verbum est, sine dum virtus est, sine dum sapientia est, sine dum lux est, sine dum Filius est, et quicquid horum est, non aliunde est quam ex Patre, Patri suo originem suam debens." The next is from Athanasius, who has never been accused of holding low opinions respecting the second person of the holy Trinity. This father, in his sixth discourse against the Arians, says, κατὰ γὰρ τοὺς ἁγίους ἐν ταύτῃ τῇ ἀρχῇ καὶ ὁ λόγος καὶ ὁ λόγος, καὶ πρὸς τὸν θεόν. ὁ δὲ γὰρ ἐστὶν ἡ ἀρχὴ, καὶ ἰστέον ἐξ αὐτοῦ ἐστὶν, διὰ τοῦτο καὶ θεὸς καὶ ὁ λόγος; according to *John*, the word was in this first prin-

ple, and the word was God. For God is the principle; and because the word is from the trinitie, therefore the word is God. Agreeably to this doctrine, the Nicene fathers, in the creed which they published for the use of the universal church, style the only begotten Son, God of God

God and his attributes.

64
Regardless however of antiquity, and, as we think, of the plain sense of scripture, some modern divines of great learning contend, that the three persons in Deity are all substantial, co-eternal, co-ordinate, without derivation, subordination, or dependence, of any sort, as to nature or essence; whilst others affirm, that the second and third persons derive from the first their personality, but not their nature. We shall consider these opinions as different, though, from the obscurity of the language in which we have always seen them expressed, we cannot be certain but they may be one and the same. The maintainers of the former opinion hold, that the three persons called *Elohim* in the Old Testament, naturally independent on each other, entered into an agreement before the creation of the world, that one of them should in the fulness of time assume human nature, for the purpose of redeeming mankind from that misery into which it was foreseen that they would fall. This antemundane agreement, they add, constitutes the whole of that paternal and filial relation which subsists between the first and second persons whom we denominate Father and Son; and they hold, that the Son is said to be begotten before all worlds, to indicate that *He* who was before all worlds was begotten, or to be begotten, into the office of redeemer; or, more desigatively, to signify that he undertook that office before the creation, and assumed to himself some appearance or figure of the reality in which he was to execute it; and he is called *μωϋσῆς* or the only begotten, because he alone was begotten into the office of redeemer.

64
Some modern divines, but

To many of our readers we doubt not but this will appear a very extraordinary doctrine, and not easy to be reconciled with the unity of God. It is however sufficiently overturned by two sentences of holy scripture, about the meaning of which there can be no dispute. "In this (says St John †) was manifested the love of God towards us, because that God sent his only begotten Son into the world, that we might live through him." Taking the word *son* in its usual acceptation, this was certainly a wonderful degree of love in the Father of mercies to send into the world on our account a person so nearly related to him as an only son; but if we substitute this novel interpretation of the words *only begotten son* in their stead, the apostle's reasoning will lose all its force. St John will then be made to say, "In this was manifested the love of God toward us, because that God sent a divine person equal to himself, and no way related to him, but who had before the creation covenanted to come into the world, that we might live through him." Is this a proof of the love of the person here called God? Again, the inspired author of the epistle to the Hebrews, treating of our Saviour's priesthood, says, among other things expressive of his humiliation, that "though he was a son, yet learned he obedience (or, as others would render the words *μαθήναι ὑπακοήν*, he taught obedience) by the things which he suffered †." If the word *son* be here understood in its proper sense, this verse displays in a very striking manner the condescension of our divine Redeemer, who, though he was no less a person than the proper Son of God by nature, yet vouchsafed to learn or teach us obedience by the things which he suffered; but if we substitute this metaphorical forship in place of the natural, the reasoning of the author (for that he is reasoning cannot be denied) will be very extraordinary. "Though this divine personage agreed before all worlds to suffer death for the redemption of man, yet learned he obedience, or yet taught

Subordination of the second and third persons.

|| John xvii. 3.

† 1 Cor. viii. 6.

God and his attribute.

he us obedience, by the things which he suffered." What sense is there in this argument? Is it a proof of condescension to fulfil one's engagement? Surely, if the meaning of the word *son*, when applied to the second person of the blessed Trinity, were what is here supposed, the inspired writer's argument would have been more to the purpose for which it is brought had it run thus; "Though he was not a son, i. e. though he had made no previous agreement, yet condescended he to learn or teach," &c.

The other opinion, which supposes the Son and the Holy Ghost to derive from the Father their personality, but not their nature, is to us wholly unintelligible; for personality cannot exist, or be conceived in a state of separation from all natures, any more than a quality can exist in a state of separation from all substances. The former of these opinions we are unable to reconcile with the unity of God; the latter is clothed in words that have no meaning. Both, as far we can understand them, are palpable polytheism; more palpable indeed than that of the Grecian philosophers, who though they worshipped gods many, and lords many, yet all held one God supreme over the rest. See POLYTHEISM, n^o 32.

66 The second and third persons n^o 10th or 11th.

But if the Son and the Holy Ghost derive their nature as well their personality from the Father, will it not follow that they must be posterior to him in time, since every effect is posterior to its cause? No; this consequence seems to follow only by reasoning too closely from one nature to another, when there is between the two but a very distant analogy. It is indeed true, that among men, every father must be prior in time as well as in the order of nature to his son; but were it essential to a man to be a father, so as that he could not exist otherwise than in that relation, it is obvious that his son would be coeval with himself, though still as proceeding from him, he would be posterior in the order of nature. This is the case with all necessary causes and effects. The visible sun is the immediate and necessary cause of light and heat, either as emitting the rays from his own substance, or as exciting the agency of a fluid diffused for that purpose through the whole system. Light and heat therefore must be as old as the sun; and had he existed from all eternity, they would have existed from eternity with him, though still, as his effects, they would have been behind him in the order of nature. Hence it is, that as we must speak analogically of the Divine nature, and when treating of mind, even the Supreme mind, make use of words literally applicable only to the modifications of matter, the Nicene fathers illustrate the eternal generation of the second person of the blessed Trinity by this procession of light from the corporeal sun, calling him *God of God, light of light*.

81 1st 2nd 3rd 4th 5th 6th 7th 8th 9th 10th 11th 12th 13th 14th 15th 16th 17th 18th 19th 20th 21th 22th 23th 24th 25th 26th 27th 28th 29th 30th 31st 32nd 33rd 34th 35th 36th 37th 38th 39th 40th 41st 42nd 43rd 44th 45th 46th 47th 48th 49th 50th 51st 52nd 53rd 54th 55th 56th 57th 58th 59th 60th 61st 62nd 63rd 64th 65th 66th 67th 68th 69th 70th 71st 72nd 73rd 74th 75th 76th 77th 78th 79th 80th 81st 82nd 83rd 84th 85th 86th 87th 88th 89th 90th 91st 92nd 93rd 94th 95th 96th 97th 98th 99th 100th

Another comparison has been made use of to enable us to form some notion, however inadequate, how three Divine persons can subsist in the same substance, and thereby constitute but one God. Moses informs us, that man was made after the image of God. That this relates to the soul more than to the body of man, has been granted by all but a few gross anthropomorphites; but it has been well observed \S , that the soul, though in itself one indivisible and unextended substance, is conceived as consisting of three principal faculties, the *understanding*, the *memory*, and the *will*. Of these, though they are all coeval in time, and equally essential to a rational soul, the understanding is in the order of nature obviously the first, and the memory the second; for things must be perceived before they can be remembered; and they must be remembered and compared together before they can excite volitions, from being, some agreeable, and others disagreeable. The memory therefore may be said to spring from the understanding, and the will

from both; and as these three faculties are conceived to constitute one soul, so may three Divine persons partaking of the same individual nature or essence constitute one God.

God and his attribute.

67 No contradiction in the Catholic doctrine of the Trinity.

These parallels or analogies are by no means brought forward as proofs of the Trinity, of which the evidence is to be gathered wholly from the word of God; but they serve perhaps to help our labouring minds to form the justest notions of that adorable mystery which it is possible for us to form in the present state of our existence; and they seem to rescue the doctrine sufficiently from the charge of contradiction, which has been so often urged against it by Unitarian writers. To the last analogy we are aware it has often been objected, that the soul may as well be said to consist of ten or twenty faculties as of three, since the passions are equally essential to it with the understanding, the memory, and the will, and are as different from one another as these three faculties are. This, however, is probably a mistake; for the best philosophy seems to teach us, that the passions are not innate; that a man might exist through a long life a stranger to many of them; and that there are probably no two minds in which are generated *all* the passions (see PASSION); but understanding, memory, and will, are absolutely and equally necessary to every rational being. But whatever be in this, if the human mind can be *conceived* to be one indivisible substance, consisting of different faculties, whether many or few, why should it be thought an impossibility for the infinite and eternal nature of God to be communicated to three persons acting different parts in the creation and government of the world, and in the great scheme of man's redemption.

68 Objections.

To the doctrine of the Trinity many objections have been made, as it implies the divinity of the Son and the Holy Ghost; of whom the former assumed our nature, and in it died for the redemption of man. These we shall notice when we come to examine the revelations more peculiarly Christian; but there is one objection which, as it respects the doctrine in general, may be properly noticed here. It is said that the first Christians borrowed the notion of a Tri-une God from the later Platonists; and that we hear not of a Trinity in the church till converts were made from the school of Alexandria. But if this be the case, we may properly ask, whence had those Platonists the doctrine themselves? It is not surely so simple or so obvious as to be likely to have occurred to the reasoning mind of a Pagan philosopher; or if it be, why do Unitarians suppose it to involve a contradiction? Plato indeed taught a doctrine in some respects similar to that of the Christian Trinity, and so did Pythagoras, with many other philosophers of Greece and the East (see PLATONISM, POLYTHEISM, and PYTHAGORAS); but tho' these sages appear to have been on some occasions extremely credulous, and on others to have indulged themselves in the most mysterious speculations, there is no room to suppose that they were *naturally weaker men* than ourselves, or that they were capable of inculcating as truths what they *perceived* to involve a *contradiction*. The Platonic and Pythagorean Trinities never could have occurred to the mind of him who merely from the works of creation endeavoured to discover the being and attributes of the Creator; and therefore as those philosophers travelled into Egypt and the East in quest of knowledge, it appears to us in the highest degree probable, that they picked up this mysterious and sublime doctrine in those regions where it had been handed down as a dogma from the remotest ages, and where we know that science was not taught systematically, but detailed in collections of sententious maxims and traditionary opinions. If this be so, we cannot doubt but that the Pagan Trinities had their origin in some primæval reve-

69 Answers.

revelation. Nothing else indeed can account for the general prevalence of a doctrine so remote from human imagination, and of which we find vestiges in the sacred books of almost every civilized people of antiquity. The corrupt state in which it is viewed in the writings of Plato and others, is the natural consequence of its descent through a long course of oral tradition; and then falling into the hands of men who bent every opinion as much as possible to a conformity with their own speculations. The Trinity of Platonism therefore, instead of being an objection, lends, in our opinion, no feeble support to the Christian doctrine, since it affords almost a complete proof of that doctrine's having made part of the first revelations communicated to man.

Having thus discovered that the one God, to whom Moses gives the plural name *Elohim*, comprehends three persons; let us now inquire what power this Triune God exerted, when, as the same sacred writer informs us, he created the heaven and the earth. That by the heaven and the earth is here meant the whole universe, visible and invisible, is known to every person acquainted with the phraseology of Scripture; and we need inform no man conversant with English writers, that by *creation*, in its proper sense, is meant bringing into *being*, or making that to *exist* which existed not *before*. It must, however, be acknowledged, that the Hebrew word *ברא* does not always imply the production of substance, but very often the forming of particular organized bodies out of pre-existing matter. Thus when it is said * that "God *created* great whales, and every living creature that moveth, which the waters brought forth abundantly after their kind," and again, that "he *created* man male and female;" though the word *ברא* is used on both occasions, we are not to conceive that the bodies of the first human pair, and of these animals, were brought into being from nonentity, but only that they were formed by a proper organization being given to pre-existent matter. But when Moses says, "In the beginning God *created* the heaven and the earth," he cannot be supposed to mean that "in the beginning God only gave form to matter already existing of itself;" for in the very next verse we are assured that after this act of creation was over, "the earth was still *without form* and void," or, in other words, in a chaotic state.

That the Jews, before the coming of our Saviour, understood their lawgiver to teach a proper creation, is plain from that passage in the second book of the Maccabees, in which a mother, to persuade her son to suffer the cruellest tortures rather than forsake the law of his God, uses the following argument: "I beseech thee, my son, look upon the heaven and the earth, and all that is therein, and consider that God made them of things that were not." To the same purpose the inspired author of the epistle to the Hebrews, when magnifying the excellence of faith, says, "I through faith we understand that the worlds were framed by the word of God, so that things which are seen were not made of things which do appear;" where, as bishop Pearson has ably proved †, the phrase *ἐκ οὐρανοῦ καὶ ἐκ τῆς γῆς* is equivalent to *ex nihilo*, in the quotation from the Maccabees.

The very first verse, therefore, of the book of Genesis informs us of a most important truth, which all the unimpaired wisdom or antiquity could not discover. It assures us, that as nothing exists by chance, so nothing is necessarily existing but the three divine persons in the one Godhead. Every thing else, whether material or immaterial, derives its substance, as well as its form or qualities, from the fiat of that self-existent Being, "who was, and is, and is to come."

It does not, however, follow from this verse, or from any

other passage in the sacred Scriptures, that the whole universe was called into existence at the same instant; neither is it by any means evident that the chaos of our world was brought into being on the first of those six days during which it was gradually reduced into form. From a passage ‡ in the book of Job, in which we are told by God himself, that when the "foundation of the earth was laid the morning stars sang together, and all the sons of God shouted for joy;" it appears extremely probable that worlds had been created, formed, and inhabited, long before our earth had any existence. Nor is this opinion at all contrary to what Moses says of the creation of the stars; for though they are mentioned in the same verse with the sun and moon, yet the manner in which, according to the original, they are introduced, by no means indicates that all the stars were formed at the same time with the luminaries of our system. Most of them may have been created long before, and some of them since, our world was brought into being; for that clause (verse 16.) "he made the stars also," is in the Hebrew no more than "and the stars;" the words *he made* being inserted by the translators. The whole verse therefore ought to be rendered thus, "and God made two great lights; the greater light to rule the day, and the lesser light with the stars to rule the night;" where nothing is intimated with respect to the *time* when the stars were formed, any more than in that verse of the Psalms §, which exhorts us to give thanks to God who made the moon and stars to rule by night; for his mercy endureth "for ever." The first verse of the book of Genesis informs us, that all things spiritual and corporeal derive their existence from God; but it is nowhere said that all matter was created at the same time; and the generations of men afford sufficient evidence of a successive and continual creation of spirits.

That the whole corporeal universe *may have been* created at once must be granted; but if so, we have reason to believe that this earth, with the sun and all the planets of the system, were suffered to remain for ages in a state of chaos, "without form and void;" because it appears from other scriptures, that worlds of intelligent creatures existed, and even that some angels had fallen from a state of happiness prior to the era of the Mosaic cosmogony. That the sun and the other planets revolving round him were formed at the same time with the earth, cannot indeed be questioned; for it is not only extremely probable in itself from the known laws of nature, but is expressly affirmed by the sacred historian, who relates the formation of the sun and moon in the order in which it took place. Into the particulars of his narrative we have no occasion to enter, as it is sufficiently explained and vindicated in other articles of this work (see CREATION and EARTH); but there is one difficulty which, though we have given the common solutions of it elsewhere, we may again notice in this place, because it has furnished infidel ignorance with something like an objection to the divine legation of the Hebrew lawgiver.

Moses informs us, that on the *first day* after the production of the chaos, the *element of light* was created; and yet within a few sentences he declares, that the sun, the fountain of light, was not made till the *fourth day*. How are these two passages to be reconciled? We answer, That they may be reconciled many ways. Moses wrote for the use of a whole people, and not for the amusement or instruction of a few astronomers; and in this view his language is sufficiently proper, even though we suppose the formation of the sun and the other planets to have been carried on at the same time, and in the same progressive manner, with the formation of this earth. The voice which called light into existence would separate the fiery and luminous particles of

his art-
hires.

the chaos from those which were opaque, and, on this hypothesis, consolidate them in one globe, diffusing an obscure light through the planetary system; but if the earth's atmosphere continued till the fourth day loaded with vapours, as from the narrative of Moses it appears to have done, the sun could not till *that day* have been seen from the earth, and may therefore, in popular languages, be said with sufficient propriety to have been formed on the fourth day, as it was then first made to appear. (See CREATION, n^o 13. and EARTH, n^o 158, 174, 175). But though this solution of the difficulty serves to remove the infidel objection, and to secure the credit of the sacred historian, candour compels us to confess that it appears not to be the true solution.

The difficulty itself arises entirely from supposing the sun to be the sole fountain of light; but the truth of this opinion is not self-evident, nor has it ever been established by satisfactory proof. It is indeed to a mind divested of undue deference to great names, and considering the matter with impartiality, an opinion extremely improbable. The light of a candle placed upon an eminence may in a dark night be seen in every direction at the distance of at least three miles. But if this small body be rendered visible by means of rays emitted from itself, the flame of a candle, which cannot be supposed more than an inch in diameter, must, during every instant that it continues to burn, throw from its own substance luminous matter sufficient to fill a spherical space of six miles in diameter. This phenomenon, if real, is certainly surprising; but if we pursue the reflection a little farther, our wonder will be greatly increased. The matter which, when converted into flame, is an inch in diameter, is not, when of the consistence of cotton and tallow, of the dimensions of the 20th part of an inch; and therefore, upon the common hypothesis, the 20th part of an inch of tallow may be so stretched as to fill a space of 113,2976 cubic miles! a rarefaction which to us appears altogether incredible. We have indeed heard much of the divisibility of matter *ad infinitum*, and think we understand what are usually called *demonstrations* of the truth of that proposition; but these demonstrations prove not the actual divisibility of real solid substances, but only that upon trial we shall find no end of the ideal process of dividing and subdividing imaginary extension.

Upon the whole, therefore, we are much more inclined to believe that the matter of light is an extremely subtle fluid, diffused through the corporeal universe, and only excited to agency by the sun and other fiery bodies, than that it consists of streams continually issuing from the substance of these bodies. It is indeed an opinion pretty generally received, and certainly not improbable in itself, that light and electricity are one and the same substance (see *ELECTRICITY-Index*); but we know that the electrical fluid, though pervading the whole of corporeal nature, and, as experiments show, capable of acting with great violence, yet lies dormant and unperceived till its agency be excited by some foreign cause. Just so it may be with the matter of light. That substance may be "diffused from one end of the creation to the other, it may traverse the whole universe, form a communication between the most remote spheres, penetrate into the inmost recesses of the earth, and only wait to be put in a proper motion to communicate visible sensations to the eye. Light is to the organ of sight what the air is to the organ of hearing. Air is the medium which, vibrating on the ear, causes the sensation of sound; but it equally exists round us at all times, though there be no sonorous body to put it in motion. In like manner, light may be equally extended at all times, by night as well as by day, from the most distant fixed stars to this earth, tho' it then only strikes our eyes so as to excite visible sensations when impelled by the sun or some other mass of fire." Nor

§ Nature
displayed.

let any one imagine that this hypothesis interferes with any of the known laws of optics; for if the rays of light be impelled in straight lines, and in the same direction in which they are supposed to be emitted, the phenomena of vision must necessarily be the same.

Moses therefore was probably a more accurate philosopher than he is sometimes supposed to be. The element of light was doubtless created, as he informs us, on the first day; but whether it was then put in that state in which it is the medium of vision, we cannot know, and we need not inquire, since there was neither man nor inferior animal with organs fitted to receive its impressions. For the first three days it may have been used only as a powerful instrument to reduce into order the jarring chaos. Or if it was from the beginning capable of communicating visible sensations, and dividing the day from the night, its agency must have been immediately excited by the Divine power till the fourth day, when the sun was formed, and endowed with proper qualities for instrumentally discharging that office. This was indeed miraculous, as being contrary to the present laws of nature: but the whole creation was miraculous; and we surely need not hesitate to admit a less miracle where we are under the necessity of admitting a greater. The power which called light and all other things into existence, could give them their proper motions by ten thousand different means; and to attempt to solve the difficulties of creation by philosophic theories respecting the laws of nature, is to trifle with the common sense as well as the piety of mankind: it is to consider as subservient to a law that very power by whose continued exertion the law is established.

Having thus proved that the universe derives its being, as well as the form and adjustment of its several parts, from the one supreme and self-existent God, let us here pause, and reflect on the sublime conceptions which such astonishing works are fitted to give us of the Divine perfections.

And, in the first place, how strongly do the works of creation impress upon our minds a conviction of the infinite power of their Author? He spoke, and the universe started into being; he commanded, and it stood fast. How mighty is the arm which "stretched out the heavens and laid the foundations of the earth; which removeth the mountains, and they know it not; which overturneth them in his anger; which shaketh the earth out of her place, and the pillars thereof tremble! How powerful the word which commandeth the sun, and it riseth not; and which sealeth up the stars;" which sustaineth numberless worlds of amazing bulk suspended in the regions of empty space, and directs their various and inconceivably rapid motions with the utmost regularity! "Lift up your eyes on high, and behold, who hath created all these things? By the word of the Lord were the heavens made, and all the host of them by the breath of his mouth. Hell is naked before him, and destruction hath no covering. He stretcheth out the North over the empty place, and hangeth the earth upon nothing. He has measured the waters in the hollow of his hand, and meted out the heavens with a span; and comprehended the dust of the earth in a measure; and weighed the mountains in scales, and the hills in a balance. Behold! the nations are as a drop of the bucket, and are counted as the small dust of the balance; behold, he taketh up the isles as a very little thing. All nations before him are as nothing, and they are counted to him less than nothing, and vanity. To whom then will ye liken God, or what likeness will ye compare unto him?"

As the works of creation are the effects of God's power, they likewise in the most eminent manner display his wisdom. This was so apparent to Cicero, even from the

partial dom

God and his attributes.

partial and very imperfect knowledge in astronomy which his time afforded, that he declared \S those who could assert the contrary void of all understanding. But if that great master of reason had been acquainted with the modern discoveries in astronomy, which exhibit numberless worlds scattered through space, and each of immense magnitude; had he known that the sun is placed in the centre of our system, and that to diversity the seasons the planets move round him with exquisite regularity; could he have conceived that the distinction between light and darkness is produced by the diurnal rotation of the earth on its own axis, instead of that disproportionate whirling of the whole heavens which the ancient astronomers were forced to suppose; had he known of the wonderful motions of the comets, and considered how such eccentric bodies have been preserved from falling upon some of the planets in the same system, and the several systems from falling upon each other; had he taken into the account that there are yet greater things than these, and "that we have seen but a few of God's works;"—that virtuous Pagan would have been ready to exclaim in the words of the Psalmist, "O Lord, how manifold are thy works! In wisdom hast thou made them all; the earth is full of thy riches."

That creation is the offspring of unmixed goodness, has been already shown with sufficient evidence (see METAPHYSICS, n^o 312. and n. 29. of this article); and from the vast number of creatures on our earth endowed with life and sense, and a capability of happiness, and the infinitely greater number which probably inhabit the planets of this and other systems, we may infer that the goodness of God is as boundless as his power, and that "as is his majesty, so is his mercy." Out of his own fulness hath he brought into being numberless worlds, replenished with myriads of myriads of creatures, furnished with various powers and organs, capacities and instincts; and out of his own fulness he continually and plentifully supplies them all with every thing necessary to make their existence comfortable. "The eyes of all wait upon him, and he giveth them their meat in due season. He openeth his hand and satisfies the desires of every living thing: he loveth righteousness and judgment; the earth is full of the goodness of the Lord. He watereth the ridges thereof abundantly; he setteth the furrows thereof; he maketh it soft with showers, and blesseth the springing thereof. He crowneth the year with his goodness; and his paths drop fatness. They drop upon the pastures of the wilderness; and the little hills rejoice on every side. The pastures are clothed with flocks; the valleys also are covered with corn; they shout with joy, they also sing *". Survey the whole of what may be seen on and about this terraqueous globe, and say, if our Maker hath a sparing and a niggardly hand. Surely the Author of so much happiness must be essential goodness; and we must conclude with St John, that "God is love."

These attributes of power, wisdom, and goodness, so conspicuously displayed in the works of creation, belong in the same supreme degree to each person in the blessed Trinity; for Moses declares that the heaven and the earth were created, not by one person, but by the *Elohim*. The *Logos* indeed, or second person, appears to have been the *immediate* Creator; for St John assures us \parallel , that "all things were made by him, and that without him was not any thing made that was made." Some Arian writers of great learning (and we believe the late Dr Price was of the number) have asserted, that a being who was created himself may be endowed by the Omnipotent God with the power of creating other beings; and as they hold the *Logos* or *word* to be a creature, they contend that he was employed by the Supreme Deity to create, not the whole universe, but

only this earth, or at the utmost the solar system. "The old argument (says one of them), that no being inferior to the great Omnipotent can create a world, is so childish as to deserve no answer. Why may not God communicate the power of making worlds to any being whom he may choose to honour with so glorious a prerogative? I have no doubt but such a power may be communicated to many good men during the progress of their existence; and to say that it may *not*, is not only to limit the power of God, but to contradict acknowledged analogies."

We are far from being inclined to limit the power of God. He can certainly do whatever involves not a direct contradiction; and therefore, though we know nothing *analogous* to the power of *creating worlds*, yet as we perceive not any contradiction implied in the notion of that power being communicated, we shall admit that such a communication may be *possible*, though we think it in the highest degree *improbable*. But surely no man will contend that the *whole universe* was brought into existence by *any creature*; because that creature himself, however highly exalted, is necessarily comprehended in the notion of the universe. Now St Paul expressly affirms \S , that, by the second person in the blessed Trinity, "were *ALL things* created that are in heaven, and that are in earth, *visible and invisible*, whether they be *THRONES, or DOMINIONS, or PRINCIPALITIES, or POWERS*; all things were created by him and for him; and he is before all things, and by him all things consist." Indeed the Hebrew Scriptures in more places than one expressly declare that this earth, and of course the whole solar system, was *formed* as well as *created*, not by any inferior being, but by the *true God*, even *Jehovah* alone; and in the New Testament \ast , the Gentiles are said to be without excuse for not glorifying him as God, "because his eternal power and Godhead are clearly seen from the creation of the world." But if it were natural to suppose that the power of creating worlds has been, or ever will be, communicated to beings inferior to the great Omnipotent, this reasoning of the apostle's would be founded on false principles, and the sentence which he passed on the Heathen would be contrary to justice.

But though it be thus evident that the *Logos* was the immediate Creator of the universe, we are not to suppose that it was without the concurrence of the other two persons. The Father, who may be said to be the fountain of the Divinity itself, was certainly concerned in the creation of the world, and is therefore in the apostle's creed denominated the "Father Almighty, Maker of heaven and earth;" and that the Holy Ghost or third person is likewise a Creator, we have the express testimony of two inspired writers: "By the word of the Lord (says the Psalmist) were the heavens made, and all the host of them by the breath (Hebrew, *SPIRIT*) of his mouth." And Job declares, that the "*SPIRIT* of God made him, and that the breath of the Almighty gave him life." Indeed these three divine persons are so intimately united, that what is done by one must be done by all, as they have but one and the same will. This is the reason assigned by Origen \ast for our paying divine worship to each; \S *ὁμοδοξοῦμεν αὐτὸν τὸν πατέρα τῆς ἀληθείας καὶ τὸν υἱὸν τῆς ἀληθείας, ὅτι αὐτὸ τὸ ὑπερῶς πνεῦμα ἔστι τὸ αὐτὸν, καὶ τὸ σὺν αὐτῷ καὶ τὸ συνῆκται τῆς θεότητος*, "we worship the Father of truth, and the Son the truth itself, being two things as to Hypostasis, but one in agreement, consent, and sameness of will." Nor is their union a mere agreement in will only; it is a physical or essential union: so that what is done by one must necessarily be done by the others also, according to that of our Saviour, "I am in the Father and the Father in me: The Father who dwelleth in me, he doth the works."

Creation peculiar to God.

† Isa. xl. 12. xiv. 4-10-13. Jerem. x. 10-13. Rom. i. 18-22.

Conte. C. 1. p. 300.

Original
state of
man.

Thus we see, that to the several persons in the ever blessed Trinity is equal praise due for the creation of the world. Their all-powerful word commanded into being every thing that exists, and by the same Divine power is every thing continued in existence. Well therefore might the Psalmist call upon the heavens and the earth to praise the name of the Lord; "for he commanded, and they were created. He hath also established them for ever and ever; he hath made a decree which shall not pass. Let all things praise the name of the Lord; for his name אלהים אבותינו, Father, Son, and Holy Ghost, alone is excellent, and his glory above the earth and heaven."

SECT. II. *Of the Original State of Man, and the first Covenant of Eternal Life which God vouchsafed to make with him.*

87
Peculiarity
of the ex-
pression in
which God
is said to
make man

In the Mosaic account of the creation, every attentive reader must be struck with the manner in which the supreme Being is represented as making man: "And God said, let us make man in our image, after our likeness; and let them have dominion over the fish of the sea, and over the fowl of the air, and over the cattle, and over all the earth, and over every creeping thing that creepeth upon the earth. So God created man in his own image; in the image of God created he him; male and female created he them. And God blessed them; and God said unto them, be fruitful, and multiply, and replenish the earth, and subdue it; and have dominion over the fish of the sea, and over the fowl of the air, and over every living thing that moveth upon the earth. And God said, behold, I have given you every herb bearing seed, which is upon the face of all the earth; and every tree, in the which is the fruit of a tree yielding seed: to you it shall be for meat. And God saw every thing that he had made, and, behold, it was very good. And the evening and the morning were the sixth day. Thus the heavens and the earth were finished, and all the host of them. And on the seventh day God ended his work which he had made; and he rested on the seventh day from all his works which he had made. And God blessed the seventh day, and sanctified it: because that in it he had rested from all his work which God created and made."

Gen. i.
26, &c. ii.
2, 2, 3.

This is a very remarkable passage, and contains much important information. It indicates a plurality of persons in the Godhead, describes the nature of man as he came at first from the hands of his Creator, and furnishes data from which we may infer what were the duties required of him in that primeval state, and what were the rewards to which obedience would entitle him.

81
In his own
image.

Of the plurality of Divine persons, and their essential union, we have treated in the preceding section, and proceed now to inquire into the specific nature of the first man. This must be implied in the *image of God*, in which he is said to have been created; for it is by that phrase alone that he is characterized, and his pre-eminence marked over the other animals. Now this image or likeness must have been found either in his body alone, his soul alone, or in both united. That it could not be in his body alone, is obvious; for the infinite and omnipotent God is allowed by all men to be without body, parts, or passions, and therefore to be such as nothing corporeal can possibly resemble.

82
Different
opinions re-
specting
the image
of God.

If this likeness is to be found in the human soul, it comes to be a question in what faculty or power of the soul it consists. Some have contended, that man is the only creature on this earth who is animated by a principle essentially different from matter; and hence they have inferred, that he is said to have been formed in the Divine image, on ac-

count of the immateriality of that vital principle which was infused into his body when the "Lord God breathed into his nostrils the breath of life, and man became a living soul." That this account of the animation of the body of man indicates a superiority of the human soul to the vital principle of all other animals, cannot, we think, be questioned; but it does not therefore follow, that the human soul is the only immaterial principle of life which animates any terrestrial creature. It has been shown elsewhere (see METAPHYSICS, n° 235.), that the power of sensation, attended with individual consciousness, as it appears to be in all the higher species of animals, cannot result from any organical structure, or be the quality of a compound extended being. The vital principle in such animals therefore must be immaterial as well as the human soul; but as the word *immaterial* denotes only a negative notion, the souls of men and brutes, though both immaterial, may yet be substances essentially different. This being the case, it is plain that the Divine image in which man was formed, and by which he is distinguished from the brute creation, cannot consist in the mere circumstance of his mind being a substance different from matter, but in some positive quality which distinguishes him from every other creature on this globe.

About this characteristic quality very various opinions have been formed. Some have supposed "that the image of God in Adam appeared in that rectitude, righteousness, and holiness, in which he was made; for God made man upright (Eccles. vii. 2.), a holy and righteous creature; which holiness and righteousness were in their kind perfect; his understanding was free from all error and mistakes; his will biased to that which is good; his affections flowed in a right channel towards their proper objects; there were no sinful motions and evil thoughts in his heart, nor any propensity or inclination to that which is evil; and the whole of his conduct and behaviour was according to the will of God. And this righteousness (say they) was *natural*, and not personal and acquired. It was not obtained by the exercise of his free-will, but was created with him, and belonged to his mind, as a natural faculty or instinct." They therefore call it *original righteousness*, and suppose that it was lost in the fall.

To this doctrine many objections have been made. It has been said that righteousness consisting in right actions proceeding from proper principles, could not be created with Adam and make a part of his nature; because nothing which is produced in a man without his knowledge and consent can be in him either virtue or vice. Adam, it is added, was unquestionably placed in a state of trial, which proves that he had righteous habits to a *quire*; whereas the doctrine under consideration, affirming his original righteousness to have been perfect, and therefore incapable of improvement, is inconsistent with a state of trial. That his understanding was free from all errors and mistakes, has been thought a blasphemous position, as it attributes to man one of the incommunicable perfections of the Deity. It is likewise believed to be contrary to fact; for either his understanding was bewildered in error, or his affections flowed towards an improper object, when he suffered himself at the persuasion of his wife to transgress the express law of his Creator. The objector expresses his wonder at its having ever been supposed that the *whole* of Adam's conduct and behaviour was according to the will of God, when it is so notorious that he yielded to the first temptation with which, as far as we know, he was assailed in paradise.

Convinced by these and other arguments, that the image of God in which man was created could not consist in original righteousness, or in exemption from all possibility of error, many learned men, and Bishop Bull* among others, have

have supposed, that by the image of God is to be understood certain gifts and powers supernaturally infused by the Holy Spirit into the minds of our first parents, to guide them in the ways of piety and virtue. This opinion they rest chiefly upon the authority of Tatian, Irenæus, Tertullian, Cyprian, Athanasius, and other fathers of the primitive church; but they think, at the same time, that it is countenanced by several passages in the New Testament. Thus when St Paul says §, "and so it is written, The first man Adam was made a living soul, the last Adam was made a quickening Spirit;" they understand the whole passage as relating to the creation of man, and not as drawing a comparison between Adam and Christ, to show the great superiority of the latter over the former. In support of this interpretation they observe, that the apostle immediately adds, "howbeit, that was not first which is spiritual, but that which is natural, and afterwards that which is spiritual;" an addition which they think was altogether needless, if by the quickening Spirit he had referred to the incarnation of Christ, which had happened in the very age in which he was writing. They are therefore of opinion, that the body of Adam, after being formed of the dust of the ground, was first animated by a vital principle endowed with the faculties of reason and sensation, which entitled the whole man to the appellation of a living soul. After this they suppose certain graces of the Holy Spirit to have been infused into him, by which he was made a quickening spirit, or formed in the image of God; and that it was in consequence of this succession of powers communicated to the same person, that the apostle said, "Howbeit, that was not first which is spiritual, but that which is natural."

We need hardly observe, that with respect to a question of this kind the authority of *Tatian* and the other fathers quoted is nothing. Those men had no better means of discovering the true sense of the scriptures of the Old Testament than we have; and their ignorance of the language in which these scriptures are written, added to some metaphysical notions respecting the soul, which too many of them had derived from the school of Plato, rendered them very ill qualified to interpret the writings of Moses. Were authority to be admitted, we should consider that of bishop Bull and his modern followers as of greater weight than the authority of all the ancients to whom they appeal. But authority cannot be admitted; and the reasoning of this learned and excellent man from the text of St Paul is surely very inconclusive. It makes two persons of Adam; a first, when he was a natural man composed of a body and a reasonable soul; a second, when he was endowed with the gifts of the Holy Spirit and by them formed in the image of God! In the verse following too, the apostle expressly calls the second man, of whom he had been speaking, "the Lord from heaven;" but this appellation we apprehend to be too high for Adam in the state of greatest perfection in which he ever existed. That our first parents were endowed with the gifts of the Holy Ghost, we are strongly inclined to believe for reasons which shall be given by and by; but as these gifts were adventitious to their nature, they could not be that image in which God made man.

Since man was made in the image of God, that phrase, whatever be its precise import, must denote something peculiar and at the same time essential to human nature; but the only two qualities at once natural and peculiar to man are his shape and his reason. As none but an anthropomorphite will say that it was Adam's shape which reflected this image of his Creator, it has been concluded that it was the faculty of reason which made the resemblance. To give strength to this argument it is observed †, that when God says, "let us make man in our image," he immediately adds,

"and let them have dominion over the fish of the sea, and over the fowl of the air, and over the cattle, and over all the earth;" but as many of the cattle have much greater bodily strength than man, this dominion could not be maintained but by the faculty of reason bestowed upon him and withheld from them.

If the image of God was impressed only on the mind of man, this reasoning seems to be conclusive; but it has been well observed ‡ that it was the whole man, and not the *soul alone*, or the *body alone*, that is said to have been formed in the divine image; even as the whole man, soul and body, is the seat of the new and spiritual image of God in regeneration and sanctification. "The very God of peace (says the apostle) sanctify you wholly; and may your whole *spirit, soul and body*, be preserved blameless to the coming of our Lord Jesus Christ." It is worthy of notice too, that the reason assigned for the prohibition of murder to Noah and his sons after the deluge, is, that man was made in the image of God. "Whoso sheddeth man's blood, by man shall his blood be shed; for in the image of God made he man." These texts seem to indicate, that whatever be meant by the image of God, it was stamped equally on the soul and on the body. In vain is it said that man cannot resemble God in shape. This is true, but it is little to the purpose; for man does not resemble God in his reasoning faculty more than in his form. It would be idolatry to suppose the supreme majesty of heaven and earth to have a body or a shape; and it would be little short of idolatry to imagine that he is obliged to compare ideas and notions together; to advance from particular truths to general propositions; and to acquire knowledge, as we do, by the tedious processes of inductive and syllogistic reasoning. There can therefore be no direct image of God either in the soul or in the body of man; and the phrase really seems to import nothing more than those powers or qualities by which man was fitted to exercise dominion over the inferior creation; as if it had been said, "Let us make man in our image, after our likeness, that *they may have dominion*, &c." But the erect form of man contributes in some degree, as well as his rational powers, to enable him to maintain his authority over the brute creation; for it has been observed by travellers, that the fiercest beast of prey, unless ready to perish by hunger, shrinks back from a steady look of the human face divine.

By some *, however, who have admitted the probability of this interpretation, another, and in their opinion a still better reason, has been devised for its being said that man was formed in the image of God. All the members of Christ's body, say they, were written and delineated in the book of God's purposes and decrees, and had an ideal existence from eternity in the divine mind; and therefore the body of Adam might be said to be formed after the image of God, because it was made according to that idea. But to this reasoning objections may be urged, which we know not how to answer. All things that ever were or ever shall be, the bodies of us who live at present as well as the bodies of those who lived 5000 years ago, have from all eternity had an ideal existence in the Divine mind; nor in this sense can one be said to be prior to another. It could not therefore be after the idea of the identical body of Christ that the body of Adam was formed; for in the Divine mind ideas of both bodies were present together from all eternity, and each body was undoubtedly formed after the ideal archetype of itself. It may be added likewise, that the body of Christ was not God, nor the idea of that body the idea of God. Adam therefore could not with propriety, or even with truth, be said to have been formed in the image of God, if by that phrase nothing more were intended than the resemblance between his body and the body of Christ.

Original state of man.

These objections to this interpretation appear to us unanswerable; but we mean not to dictate to our readers. Every man will adopt that opinion which he thinks supported by the best arguments; but it is obvious, that whatever here may be meant by the image of God in which man was made, the phrase undoubtedly comprehends all those powers and qualities by which he is enabled to maintain his authority over the inferior creation. Among these the faculty of reason is confessedly the most important; for it is by it that man is capable of being made acquainted with the Author of his being, the relation which subsists between them, and the duties implied in that relation from the creature to the Creator.

80 Religious instruction communicated to Adam.

That the first man, however, was not left to discover these things by the mere efforts of his own unassisted reason, we have endeavoured to show in another place; (See RELIGION, n^o 5—10.) and the conclusion to which we were there led, is confirmed by the portion of revelation before us. The inspired historian says, that "God blessed the seventh day and sanctified it, because that in it he had rested from all his works, which he created and made;" but Adam could not have understood what was meant by the sanctification of a particular day, or of any thing else, unless he had previously received some religious instruction. There cannot therefore be a doubt, but that as soon as man was made, his Creator communicated to him the truths of what is called natural religion, which we have endeavoured to explain and establish in Part I. of this article; and to these were added the precept to keep holy the Sabbath-day, and set it apart for the purposes of contemplation and worship.

80 Institution of the Sabbath.

This was a very wise institution, as all the divine institutions must be. "The great end for which we are brought into life, is to attain the knowledge and be confirmed in the love of God. This includes obedience to his will in thought, word, and deed, or that course of conduct which can alone make us happy here, and fit us for everlasting glory hereafter. But of these things we cannot retain a proper sense without close and repeated application of thought; and the unavoidable cares and concerns of the present life occupying much of our attention, it is, in the nature of things, necessary that some certain portion of time should be appropriated to the purposes of religious instruction and the public adoration of our Creator, in whom we all live, and move, and have our being." Hence a very learned divine † has interred, that though the particular time is a matter of positive appointment, the observation of a sabbath in general is a duty of natural religion, as having its foundation in the reason of things. See SABBATH.

† Dr. Taylor's Sermon.

81 Duties of man in his original state.

Man therefore in his natural and original state was a rational and religious being, bound to do "justice, to love mercy, to walk humbly with his God, and to keep holy the Sabbath-day." These seem to be all the duties which in that state were required of him; for as soon as he was introduced into the terrestrial paradise and admitted into covenant with his Maker, he was placed in a supernatural state, when other duties were of course enjoined.

Gen. i. 27. v. 2.

That our first parents were both made on the sixth day, Moses expressly affirms when he says †, that "God created them male and female, and blessed them, and called their name Adam (κ), in the day when they were created:" but that they were introduced into the garden of Eden on that day, is an opinion which, however gene-

rally it may be received, seems not to be reconcileable with the plain narrative of the sacred penman. After telling us that on the sixth day God finished all his works, which he saw to be very good, and rested on the seventh day, he briefly recapitulates the history of the generations of the heavens and of the earth, gives us a more particular account of the formation of the first man, informing us that the "Lord God formed him out of the dust of the ground, and breathed into his nostrils the breath of life, when man became a living soul;" and then proceeds to say ‡, that the "Lord God planted a garden eastward in Eden, where he put the man whom he had formed." From this short history of the first pair it appears beyond dispute evident, that neither the man nor the woman was formed in the garden; and that from their creation some time elapsed before the garden was prepared for their reception, is likewise evident from a comparison of Gen. i. 29. with Gen. ii. 16, 17. In the first of these passages God gives to man, immediately after his creation, "every herb bearing seed which was upon the face of all the earth, and every tree, without exception, in which was the fruit of a tree bearing seed: to him he said it should be for meat." In the second, "he commanded the man, saying, of every tree of the garden thou mayest freely eat; but of the tree of knowledge of good and evil, thou shalt not eat of it; for in the day thou eatest thereof thou shalt surely die." When the first grant of food was given, Adam and his wife must have been where no tree of knowledge grew, and they must have been intended to live at least so long in that state as that they should have occasion for food, otherwise the formal grant of it would have been not only superfluous, but apt to mislead them with respect to the subsequent restriction.

Original state of man.

Gen. ii. 7, 8, and 15.

92 Before he was placed in the garden of Eden.

In this original state man was under the discipline of what we have called natural religion, entitled to happiness while he should perform the duties required of him, and liable to punishment when he should neglect those duties, or transgress the law of his nature as a rational and moral agent. This being the case, it is a matter of some importance, and what will enable us to perceive more clearly the prerogatives of Christianity, to ascertain, if we can, what the rewards and punishments are which natural religion holds out to her votaries.

That under every dispensation of religion the pious and virtuous man shall, during the whole of his existence, enjoy more happiness than misery; and that the incorrigibly wicked, if there be any such, shall have a greater portion of misery than happiness, are truths which cannot be controverted by any one who admits, that the Almighty governor of the universe is a Being of wisdom, goodness, and justice. But respecting the rewards of virtue and the punishment of vice, more than these general truths seems not to be taught by natural religion. Many divines, however, of great learning and worth, have thought otherwise, and have contended, that from the nature of things the rewards bestowed by an infinite God upon piety and virtue must be eternal like their author. These men indeed appear willing enough to allow that the punishments with which natural religion is armed against vice must be only of a temporary duration, because reason, say they, is ready to revolt at the thought of everlasting punishment.

91 Did not, when perished, entitle him to eternity.

This opinion, which confounds natural with revealed religion, giving to the former an important truth which belongs exclusively

(κ) The woman was some time afterwards distinguished by the name of Eve חַוָּה, because she was to be the mother of all living, and particularly of that blessed seed which was to bruise the head of the serpent. See Parkhurst's Lexicon on the word.

exclusively to the latter, has been so ably confuted by a lea-
 ned writer, who was never averse from allowing to human
 reason all the discoveries which it can justly claim, that we
 shall submit his arguments to our readers in preference to
 any thing which we can give ourselves.

“ If reason doth, on the one hand, seem to revolt at *ever-
 lasting punishment*, we must confess that FANCY, on the other,
 (even when full plumed by *vanity*), hath scarce force enough
 to rise to the idea of *infinite rewards*. How the heart of man
 came to consider this as no more than an adequate retribution
 for his right conduct during the short trial of his virtue here,
 would be hard to tell, did we not know what monsters
 PRIDE begot of old upon *Pagan philosophy*; and how much
 greater still these latter ages have disclosed, *by the long in-
 cubation of school-divinity upon folly*. What hath been
 urged from natural reason, in support of this extravagant
 pretumption, is so very slender, that it recoils as you enforce
 it. First, you say, ‘ that the soul, the subject of these eternal
 rewards, being *immaterial*, and so therefore unaffected by
 the causes which bring material things to an end, is, by its
 nature, fitted for eternal rewards.—This is an argument *ad
 ignorantiam*, and holds no farther.— Because an *immaterial* be-
 ing is not subject to that mode of dissolution which affects
 material substances, you conclude it to be eternal. This is
 going too fast. There may be, and probably are, many
 natural causes (unknown indeed to us), whereby immaterial
 beings come to an end. But if the nature of things cannot,
 yet God certainly can, put a final period to such a being when
 it hath served the purpose of its creation. Doth ANNIHI-
 LATION impeach that wisdom and goodness which was dis-
 played when God brought it *out of nothing*? Other immate-
 rial beings there are, *viz.* the souls of brutes, which have the
 same natural security with man for their existence, of whose
eternity we never dream. But pride, as the poet observes,
calls God unjust.

If man alone engross not heaven’s high care ;
 Alone made *perfect* here, IMMORTAL there.

However, let us (for argument’s sake) allow the human
 soul to be unperishable by nature, and secured in its ex-
 istence by the unchangeable will of God, and see what will
 follow from thence— An *infinite* reward for virtue, during one
 moment of its existence, because reason discovers that, by
 the law of nature, *some* reward is due? By no means.
 When God hath amply repaid us for the performance of our
 duty, will he be at a loss how to dispose of us for the long
 remainder of *eternity*? May he not find new and endless
 employment for reasonable creatures, to which, when pro-
 perly discharged, new rewards and in endless succession will
 be assigned? Modest reason seems to dictate this to the fol-
 lowers of the *law of nature*. The flattering expedient of
 ETERNAL REWARDS for virtue here was invented in the sim-
 plicity of early speculation, after it had fairly brought men
 to conclude that the soul is immaterial.

“ Another argument urged for the eternity of the re-
 wards held out by natural religion to the practice of piety
 and virtue is partly physical and partly moral. The merit
 of service (say the admirers of that religion) increases in
 proportion to the excellence of that Being to whom our ser-
 vice is directed and becomes acceptable. An infinite being,
 therefore, can dispense no rewards but what are infinite.
 And thus the virtuous man becomes intitled to immortality.

“ The misfortune is, that this reasoning holds equally on
 the side of the unmerciful doctors, as they are called, who
 doom the wicked to EVERLASTING PUNISHMENT. Indeed
 were this the only discredit under which it labours, the
 merciless doctors would hold themselves little concerned.
 But the truth is, that the argument from *infinity* proves

just nothing. To make it of any force, both the parties
 should be *infinite*. This inferior emanation of God’s *image*,
 MAN, should either be supremely good or supremely bad, a
 kind of deity or a kind of devil. But these reasoners, in
 their attention to the *divinity*, overlook the *humanity* which
 makes the decrease keep pace with the accumulation, till
 the rule of logic, that the *conclusion follows the weaker* part,
 comes in to end the dispute †.

These arguments seem to prove unanswerably that im-
 mortality is not essential to any part of the compound being
 man, and that it cannot be claimed as a reward due to his
 virtue. It is not indeed essential to any created being, for
 what has not existence of itself, cannot of itself have per-
 petuity of existence (see METAPHYSICS, n^o 272, &c.) ; and
 as neither man nor angel can be profitable to God, they can-
 not claim from him any thing as a debt. Both, indeed, as
 moral agents have duties prescribed them ; and while they
 faithfully perform these duties, they have all the security
 which can arise from the perfect benevolence of him who
 brought them into existence, that they shall enjoy a suffi-
 cient portion of happiness to make that existence preferable
 to non-existence; but reason and philosophy furnish no data
 from which it can be inferred that they shall exist for ever.
 Man is composed in part of perishable materials. However
 perfect Adam may be thought to have been when he came first
 from the hands of his Creator, his body, as formed of the dust
 of the ground, must have been naturally liable to decay and dis-
 solution. His soul, indeed, was of a more durable substance ;
 but as it was formed to animate his body, and had no prior
 conscious existence, it is not easy to conceive what should have
 led him, under an equal providence, where rewards and
 punishments were exactly distributed, to suppose that one
 part of him should survive the other. In his natural and
 original state, before the covenant made with him in paradise,
 he was unquestionably a mortal creature. How long he
 continued in that state, it seems not possible to form a plau-
 sible conjecture. Bishop Warburton supposes him to have
 lived several years under no other dispensation than that of
 natural religion; during which he was as liable to death as his
 fallen posterity are at present.

“ We must needs conclude (says this learned writer *) ,
 that God having tried Adam in the *state of nature*, and ap-
 proved of the good use he made of his free-will under the
 direction of that light, advanced him to a superior station in
Paradise. How long, before this remove, man had con-
 tinued subject to *natural religion* alone, we can only guess: but
 of this we may be assured, that it was some considerable
 time before the garden of Eden could naturally be made
 fit for his reception. Since Moses, when he had concluded
 his history of the creation, and of God’s *rest* on, and *sancti-
 fication* of, the seventh day proceeds to speak of the condi-
 tion of this new world in the following terms : “ And God
 made every plant of the field before it was in the earth, and
 every herb of the field before it grew ; for the Lord God had
 not caused it to rain upon the earth †.” Which seems plainly
 to intimate, that when the seeds of vegetables had been
 created on the third day, they were left to nature, in its
 ordinary operations, to mature by sun and showers. So
 that when in course of time Paradise was become capable
 of accommodating its inhabitants, they were transplanted
 thither.”

This reasoning is not without a portion of that ingenuity
 which was apparent in every thing that fell from the pen of
 Warburton ; but it was completely confuted almost as soon
 as it was given to the public, and shown to be deduced
 from premises which could be employed against the author’s
 system. If only the *seeds* of vegetables were created on the
 third day, and then left to nature, in its ordinary operations,

to mature by sun and showers, the first pair must have perished before a single vegetable could be fit to furnish them with food; and we may suppose that it was to prevent this disaster that the garden of Eden was miraculously stored at once with full grown trees and fruit in perfect maturity, whilst the rest of the earth was left under the ordinary laws of vegetation. There is, however, no evidence that they were only the *seeds* of vegetables that God created. On the contrary, Moses says expressly †, that God made the earth on the third day bring forth the herb *yielding seed* after his kind, and the tree *yielding fruit* whose *seed* was in itself after his kind: and when he recapitulates the history of the creation, he says, that God made, not every seed, but every *plant* of the field *before* it was in the earth, and every *herb* of the field *before* it grew. From the process of vegetation, therefore, nothing can be inferred with respect to the time of Adam's introduction into Paradise, or to ascertain the duration of his original state of nature. If angels were created during the six days of which the Hebrew law-giver writes the history, an hypothesis very generally received (see ANGEL), though in the opinion of the present writer not very probable, there can be no doubt but our first parents lived a considerable time under the law of nature before they were raised to a superior station in the garden of Eden; for it seems very evident that the period of their continuance in that station was not long. Of this, however, nothing can be said with certainty. They may have lived for years or only a few days in their original state; but it is very necessary to distinguish between that state in which they were under no other dispensation than what is commonly called *natural religion*, entitled, upon their obedience, to the indefinite rewards of piety and virtue, and their state in Paradise when they were put under a new law, and by the free grace of God promised, if they should be obedient, a supernatural and eternal reward. Into that state we must now attend them, and ascertain, if we can, the precise terms of the first covenant.

Moses, who in this investigation is our only guide, tells us, that the Lord God, after he had formed the first pair, "planted a garden eastward in Eden, and took the man and put him into the garden to dress it and to keep it. And the Lord God (continues he) commanded the man, saying, of every tree of the garden thou mayest freely eat; but of the tree of the knowledge of good and evil thou shalt not eat of it; for in the day that thou eatest thereof, thou shalt surely die †." Here is no mention made of the laws of piety and moral virtue resulting from the relation in which the various individuals of the human race stand to each other, and in which all as creatures stand to God their Almighty and beneficent Creator. With these laws Adam was already well acquainted; and he must have been sensible, that as they were founded in his nature no subsequent law could dispense with their obligation. They have been equally binding upon all men in every state and under every dispensation; and they will continue to be so as long as the

general practice of justice, mercy, and piety, shall contribute to the sum of human happiness. The new law peculiar to his paradisaical state was the command not to eat of the fruit of the tree of the knowledge of good and evil. This was a positive precept, not founded in the nature of man, but very proper to be the test of his obedience to the will of his Creator. The laws of piety and virtue are sanctioned by nature, or by that general system of rules according to which God governs the physical and moral worlds, and by which he has secured, in some state or other, happiness to the pious and virtuous man, and misery to such as shall prove incorrigibly wicked. The law respecting the forbidden fruit was sanctioned by the penalty of *death* denounced against disobedience; and by the subjects of that law the nature of this penalty must have been perfectly understood: but Christian divines, as we shall afterwards see, have differed widely in opinion respecting the full import of the Hebrew words which our translators have rendered by the phrase *thou shalt surely die*. All, however, agree that they threatened death, in the common acceptation of the word, or the separation of the soul and body as one part of the punishment to be incurred by eating the forbidden fruit; and hence we must infer, that had the forbidden fruit not been eaten, our first parents would never have died, because the penalty of death was denounced against no other transgression. What therefore is said respecting the fruit of the tree of knowledge, implies not only a law but also a covenant (L), promising to man, upon the observance of one positive precept, immortality or eternal life; which is not essential to the nature of any created being, and cannot be claimed as the merited reward of the greatest virtue or the most fervent piety.

This obvious truth will enable us to dispose of the objections which have been sometimes brought by free-thinking divines against the wisdom and justice of punishing so severely as by death the breach of a mere positive precept; which, considered in itself, or as connected with the general principles of moral obligation, appears to be a precept of very little importance. We have only to reply, that as an exemption from death is not due either to the nature or to the virtue of man, it was wise and just to make it depend upon the observance of a positive precept, to impress upon the minds of our first parents a constant conviction that they were to be preserved immortal, not in the ordinary course of divine providence, but by the special grace and favour of God. The same consideration will show us the folly of those men who, because the terms of the first covenant, as stated in some systems of theology, agree not with certain philosophical maxims which they have adopted, are for turning all that is said of the trees of knowledge and of life into figure and allegory. But the other trees which Adam and Eve were permitted to eat were certainly real trees, or they must have perished for want of food. And what rules of interpretation will authorise us to interpret *eating* and *trees* literally in one part of the sentence and figuratively in the other? A garden

in

(L) It does not appear that any transaction between God and mankind in general was denominated by a word equivalent to the English word *covenant* till the end of the fourth century, when such phraseology was introduced into the church by the celebrated Augustine, bishop of Hippo. That the phraseology is strictly proper, no man can suppose who reflects on the infinite distance between the contracting parties, and the absolute dominion of the one over the other. To be capable of entering into a *covenant*, in the proper sense of the word, both parties must have a right either to agree to the terms proposed or to reject them; but surely Adam had no right to bargain with his Maker, or to refuse the gift of immortality on the terms on which it was offered to him. The word *dispensation* would more accurately denote what is here meant by the word *covenant*; but as this last is in general use, we have retained it as sufficient, when thus explained, to distinguish what man received from God upon certain positive conditions, from what he had a claim to by the constitution of his nature.

in a delightful climate is the very habitation, and the fruits produced in that garden the very food, which we should naturally suppose to have been prepared for the progenitors of the human race; and though in the garden actually fitted up for this purpose two trees were remarkably distinguished from the rest, perhaps in situation and appearance as well as in use, the distinction was calculated to serve the best of purposes. The one called the *tree of life*, of which, while they continued innocent, they were permitted to eat, served as a sacramental pledge or assurance on the part of God, that as long as they should observe the terms of the covenant their life should be preserved; the other, of which it was death to taste, was admirably adapted to impress upon their minds the necessity of implicit obedience to the Divine will, in whatever manner it might be made known to them.

A question has been started, and it is of some importance, What would have finally become of men if the first covenant had not been violated? That they would have been all immortal is certain; but it is by no means certain that they would have lived for ever upon this earth. On the contrary, it has been an article of very general belief in all ages of the church*, that the garden of Eden was an emblem or type of heaven, and therefore called *Paradise* (see PARADISE); and that under the first covenant, mankind, after a sufficient probation here, were to be translated into heaven without tasting death. This doctrine is not indeed explicitly taught in scripture; but many things conspire to make it highly probable. The frequent communications between God and man before the fall (M), seem to indicate that Adam was training up for some higher state than the terrestrial paradise. Had he been intended for nothing but to cultivate the ground and propagate his species, he might have been left like other animals to the guidance of his own reason and instincts; which, after the rudiments of knowledge were communicated to him, must surely have been sufficient to direct him to every thing necessary to the comforts of a life merely sensual and rational, otherwise he would have been an imperfect animal. It is obvious too, that this earth, however fertile it may have originally been, could not have afforded the means of subsistence to a race of immortal beings multiplying to infinity. For these reasons, and others which will readily occur to the reader, it seems incontrovertible, that, under the first covenant, either mankind would have been successively translated to some superior state, or would have ceased to propagate their kind as soon as the earth should have been replenished with inhabitants. He who reflects on the promise, that, after the general resurrection, there is to be a new heaven and a new earth, will probably embrace the latter part of the alternative; but that part in its consequences differs not from the former. In the new earth promised in the Christian revelation, nothing is to dwell but righteousness. It will therefore be precisely the same with what we conceive to be expressed by the word heaven; and if under the first covenant this earth was to be converted into a similar place, where, after a certain period, men should neither marry nor be given in marriage, but enjoy what divines have called the *beatific vision*, we may confidently affirm, that, had the first covenant been faithfully observed, Adam and his posterity, after a sufficient probation, would all have been translated to some superior state or heaven.

To fit them for that state, the gifts of divine grace seem to have been absolutely necessary. To them it was a state

certainly supernatural, otherwise a God of infinite wisdom and perfect goodness would not, for a moment, have placed them in an inferior state. But to enable any creature, especially such a creature as man, whom an ancient philosopher has justly styled *sero auxilium*, to rise above its nature, foreign and divine aid is unquestionably requisite: and therefore, though we cannot persuade ourselves that the gifts of the Holy Ghost constituted that image of God in which man was originally made, we agree with bishop Bull, that these gifts were bestowed upon our first parents to enable them to fulfil the terms of the covenant under which they were placed.

Upon the whole, we think it apparent from the portions of scripture which we have examined, that Adam and Eve were endued with such powers of body and mind as fitted them to exercise dominion over the other animals; that those powers constituted that image of God in which they are said to have been formed; that they received by immediate revelation the first principles of all useful knowledge, and especially of that system which is usually called *natural religion*; that they lived for some time with no other religion, entitled to the natural rewards of piety and virtue, but all the while liable to death; that they were afterwards translated into paradise, where they were placed under a new law, with the penalty of death threatened to the breach of it, and the promise of endless life if they should faithfully observe it; and that they were endued with the gifts of the Holy Ghost, to enable them, if not wanting to themselves, to fulfil the terms of that covenant, which has been improperly termed the *covenant of works*, since it flowed from the mere grace of God, and conferred privileges on man to which the most perfect human virtue could lay no just claim.

SECT. III. *Of the Fall of Adam, and its Consequences.*

FROM the preceding account of the primeval state of man, it is evident that his continuance in the terrestrial paradise, together with all the privileges which he there enjoyed, were made to depend upon his observance of one positive precept. Every other duty incumbent on him, whether as resulting from what is called the law of his nature, or from the express command of his God, was as much his duty before as after he was introduced into the garden of Eden; and though the transgression of any law would undoubtedly have been punished, or have been forgiven only in consequence of sincere repentance and amendment, it does not appear that a breach of the *moral law*, or of the commandment respecting the sanctification of the *Sabbath-day*, would have been punished with death, whatever may be the import of that word in the place where it is first threatened. The punishment was denounced only against eating the fruit of the tree of the knowledge of good and evil: For "the Lord God commanded the man, saying, of every tree of the garden thou mayest freely eat, but of the tree of the knowledge of good and evil thou shalt not eat of it; for in the day that thou eatest thereof thou shalt surely die." To the word *death* in this passage divines have affixed many and different meanings. By some it is supposed to import a separation of the soul and body, while the latter was to continue in a state of conscious existence; by others, it is taken to imply annihilation or a state without consciousness; by some, it is imagined to signify eternal life in torments; and by others a spiritual and moral death, or a state necessarily subject to sin.

In

(M) That there were such frequent communications, has been shown to be in the highest degree probable by the late Dr Law bishop of Carlisle. See his *Discourse on the several Dispensations of revealed Religion*.

fall of Adam, and its consequences.

It was visited,

In any one of these acceptations it denoted something new to Adam, which he could not understand without an explanation of the term; and therefore, as it was threatened as the punishment of only one transgression, it could not be the divine intention to inflict it upon any other.

The abstaining from a particular fruit in the midst of a garden abounding with fruits of all kinds, was a precept which at first view appears of easy observation; and the penalty threatened against the breach of it was, in every sense, awful. The precept, however, was broken notwithstanding that penalty; and though we may thence infer that our first parents were not beings of such absolute perfection as by system-building divines they have sometimes been represented, we shall yet find, upon due consideration, that the temptation by which they were seduced, when taken with all its circumstances, was such as no wise and modest man will think himself able to have resisted. The short history of this important transaction, as we have it in the third chapter of the book of Genesis, is as follows.

"Now the serpent was more subtle than any beast of the field which the Lord God had made; and he said unto the woman, Yea, hath God said, ye shall not eat of every tree of the garden? And the woman said unto the serpent, We may eat of the fruit of the trees of the garden; but of the fruit of the tree which is in the midst of the garden, God hath said ye shall not eat of it, neither shall ye touch it, lest ye die. And the serpent said unto the woman, ye shall not surely die: For God doth know, that on the day ye eat thereof then your eyes shall be opened, and ye shall be as gods, knowing good and evil. And when the woman saw that the tree was good for food, and that it was pleasant to the eyes, and a tree to be desired to make one wise, she took of the fruit thereof, and did eat, and gave also unto her husband with her, and he did eat."

In consequence of a most artificial temptation,

To the less attentive reader this conversation between the serpent and the woman must appear to begin abruptly; and indeed it is not possible to reconcile it with the natural order of a dialogue, or even with the common rules of grammar, but by supposing the tempter's question, "Yea, hath God said, ye shall not eat of every tree of the garden?" to have been suggested by something immediately preceding either in words or in significant signs. Eve had undoubtedly by some means or other informed the serpent that she was forbidden to eat of the fruit upon which he was probably feasting; and that information, whether given in words or in actions, must have produced the question with which the sacred historian begins his relation of this fatal dialogue. We are told that the woman saw that the tree was good for food; that it was pleasant to the eyes, and a tree to be desired to make one wise; but all this she could not have seen, had not the serpent eaten of its fruit in her presence. In her walks through the garden, it might have often appeared pleasant to her eyes; but previous to experience she could not know but that its fruit was the most deadly poison, far less could she conceive it capable of conferring wisdom. But if the serpent eat of it before her, and then extolled its virtues in rapturous and intelligible language, she would at once see that it was not destructive of animal life, and naturally infer that it had very singular qualities. At the moment she was drawing this inference, it is probable that he invited her to partake of the delicious fruit, and that her

refusal produced the conference before us. That she yielded to his temptation need excite no wonder; for she knew that the serpent was by nature a mute animal, and if he attributed his speech to the virtues of the tree, she might infer, with some plausibility, that what had power to raise the brute mind to human, might raise the human to divine, and make her and her husband, according to the promise of the tempter, become as gods, knowing good and evil. Milton, who was an eminent divine as well as the prince of poets, makes her reason thus with herself.

Great are thy virtues, doubtless, best of fruits,
Tho' kept from man, and worthy to be admir'd;
Whose taste, too long forborne, at first essay
Gave elocution to the mute, and taught
The tongue not made for speech to speak thy praise.

* * * * *

For us alone

Was death invented? or to us denied
This intellectual food, for beasts reserved?
For beasts it seems: yet that one beast which first
Hath tasted, envies not, but brings with joy
The good hefallen him, author unsuspect,
Friendly to man, far from deceit or guile.
What fear I then, rather what know to fear
Under this ignorance of good and evil,
Of God or death, of law or penalty?
Here grows the cure of all, this fruit divine,
Fair to the eye, inviting to the taste,
Of virtue to make wise: what hinders then
To reach, and feed at once both body and mind?

Paradise Lost, book ix.

Full of these hopes of raising herself to divinity, and not, as has sometimes been supposed, led headlong by a sensual appetite, she took of the fruit and did eat, and gave to her husband with her, and he did eat. The great poet makes Adam delude himself with the same sophistry that had deluded Eve, and infer, that as the serpent had attained the language and reasoning powers of man, they should attain

Proportional ascent, which could not be
But to be gods, or angels, demi-gods.

Thus was the covenant, which, on the introduction of our first parents into paradise, their Creator was graciously pleased to make with them, broken by their violation of the condition on which they were advanced to that supernatural state; and therefore the historian tells us, that "lest they should put forth their hand and take also of the tree of life and eat, and live for ever, the Lord God sent them forth from the garden of Eden to till the ground from whence they were taken (N)." Had they been so sent forth without any farther intimation respecting their present condition or their future prospects, and if the death under which they had fallen was only a loss of consciousness, they would have been in precisely the same state in which they lived before they were placed in the garden of Eden; only their minds must now have been burdened with the inward sense of guilt, and they must have known themselves to be subject to death; of which, though not exempted from it by nature, they had probably no apprehension till it was revealed to them in the covenant of life which they had so wantonly broken.

God, however, did not send them forth thus hopeless and forlorn from the paradise of delights which they had so recently

(N) The ideas which this language conveys are indeed *allegorical*; but they inform us of this, and nothing but this, that *immortal life was a thing extraneous to our nature, and not put into our paste or composition when first fashioned by the forming hand of the Creator.* Warburton's *Divine Legation*, Book ix. Chap. 1.

cently forfeited. He determined to punish them for their transgression, and at the same time to give them an opportunity of recovering more than their lost inheritance. Calling therefore the various offenders before him, and inquiring into their different degrees of guilt, he began with pronouncing judgment on the serpent in terms which implied that there was mercy for man. "And the Lord God said unto the serpent, Because thou hast done this, thou art cursed above all cattle, and above every beast of the field: upon thy belly shalt thou go, and dust shalt thou eat all the days of thy life; and I will put enmity between thee and the woman, and between thy seed and her seed: it shall bruise thy head, and thou shalt bruise his heel."

That this sentence has been fully inflicted on the serpent, no reasoning can be necessary to evince. Every species of that reptile is more hateful to man than any other terrestrial creature; and there is literally a perpetual war between them and the human race. It is remarkable too that the head of this animal is the only part which it is safe to bruise. His tail may be bruised, or even cut off, and he will turn with fury and death on his adversary: but the slightest stroke on the head infallibly kills him. That the serpent, or at least the greater part of serpents, go on their belly, every one knows: though it is said, that in some parts of the east serpents have been seen with wings, and others with feet, and that these species are highly beautiful. If there be any truth in this story, we may suppose that these walking and flying serpents have been suffered to retain their original elegance, that mankind might see what the whole genus was before the curse was denounced on the tempter of Eve: but it is certain that most of the species have neither wings nor feet, and that many of the most poisonous of them live in burning deserts, where they have nothing to eat but the dust among which they crawl.

To this degradation of the serpent, infidels have objected, that it implies the punishment of an animal which was incapable of guilt; but this objection is founded in thoughtlessness and ignorance. The elegant form of any species of inferior animals adds nothing to the happiness of the animals themselves: the ass is probably as happy as the horse, and the serpent that crawls as he that flies. Fine proportions attract indeed the notice of man, and tend to impress upon his mind just notions of the wisdom and goodness of the Creator; but surely the symmetry of the horse or the beauty of the peacock is more properly displayed for this purpose than the elegance of the instrument employed by the enemy of mankind. The degradation of the serpent in the presence of our first parents must have served the best purposes. If they had so little reflection as not yet to have discovered that he was only the instrument with which a more powerful Being had wrought their ruin, they would be convinced, by the execution of this sentence, that the forbidden fruit had no power in itself to improve the nature either of man or of beast. But it is impossible that they could be so stupid as this objection supposes them. They doubtless knew by this time that some great and wicked spirit had actuated the organs of the serpent; and that when enmity was promised to be put between its seed and the seed of the woman, that promise was not meant to be fulfilled by serpents occasionally biting the heels of men, and by men in return bruising the heads of serpents! If such enmity, though it has literally taken place, was all that was meant by this prediction, why was not Adam directed to bruise the head of the identical serpent which had seduced his wife? If he could derive any consolation from the exercise of revenge, surely it would be greater from his revenging himself on his own enemy, than from the knowledge that there should be

a perpetual warfare between his descendants and the breed of serpents through all generations.

We are told, that when the foundations of the earth were laid, the morning stars sang together, and all the sons of God shouted for joy; and it is at least probable that there would be similar rejoicing when the six days work of creation was finished. If so, Adam and Eve, who were but a little lower than the angels, might be admitted into the chorus, and thus be made acquainted with the existence of good and evil spirits. At all events, we cannot doubt but their gracious and merciful Creator would inform them that they had a powerful enemy; that he was a rebellious angel capable of deceiving them in many ways; and that they ought therefore to be constantly on their guard against his wiles. They must have known too that they were themselves animated by something different from matter; and when they found they were deceived by the serpent, they might surely, without any remarkable stretch of sagacity, infer that their malignant enemy had actuated the organs of that creature in a manner somewhat similar to that in which their own souls actuated their own bodies. If this be admitted, the degradation of the serpent would convince them of the weakness of the tempter when compared with their Creator; and confirm their hopes, that since he was not able to preserve unhurt his own instrument of mischief, he should not be able finally to prevail against them; but that though he had bruised their heels, the promised seed of the woman should at last bruise his head, and recover the inheritance which they had lost. See PROPHECY, n^o 9, 10.

Having thus punished the original instigator to evil, the Almighty Judge turned to the fallen pair, and said to the woman, "I will greatly multiply thy sorrow and thy conception: in sorrow shalt thou bring forth children; and thy desire shall be to thy husband, and he shall rule over thee. And unto Adam he said, Because thou hast hearkened unto the voice of thy wife, and hast eaten of the tree of which I commanded thee, saying, Thou shalt not eat of it; cursed is the ground for thy sake; in sorrow shalt thou eat it all the days of thy life. Thorns also and thistles shall it bring forth unto thee, and thou shalt eat the herb of the field. In the sweat of thy face shalt thou eat bread till thou return unto the ground; for out of it wast thou taken: for dust thou art, and unto dust shalt thou return."

Here is a terrible denunciation of toil and misery and death upon two creatures; who, being inured to nothing, and formed for nothing but happiness, must have felt infinitely more horror from such a sentence, than we, who are familiar with death, intimate with misery, and "born to sorrow as the sparks fly upward," can form any adequate conception of. The hardship of it, too, seems to be aggravated by its being severer than what was originally threatened against the breach of the covenant of life. It was indeed said, "In the day thou eatest thereof, thou shalt surely die;" but no mention was made of the woman's incurring sorrow in conception, and in the bringing forth of children; of the curse to be inflicted on the ground; of its bringing forth thorns and thistles instead of food for the use of man; and of Adam's eating bread in sorrow and the sweat of his face till he should return to the dust from which he was taken.

These seeming aggravations, however, are in reality instances of divine benevolence. Adam and Eve were now subjected to death; but in the sentence passed on the serpent, an obscure intimation had been given them that they were not to remain for ever under its power. It was therefore their interest, as well as their duty, to reconcile themselves as much as possible to their fate; to wean their affections from this world, in which they were to live only for a

quences

time; and to hope, with humble confidence, in the promise of their God, that, upon their departure from it, they should be received into some better state. To enable them to wean their affections from earth, nothing could more contribute than to combine sensual enjoyment with sorrow, and lay them under the necessity of procuring their means of subsistence by labour, hard and often fruitless. This would daily and hourly impress upon their minds a full conviction that the present world is not a place fit to be an everlasting habitation; and they would look forward, with pious resignation, to death, as putting a period to all their woes. Had they indeed been furnished with no ground of hope beyond the grave, we cannot believe that the Righteous Judge of all the earth would have added to the penalty originally threatened. That penalty they would doubtless have incurred the very day on which they fell; but as they were promised a deliverance from the consequences of their fall, it was proper to train them up by severe discipline for the happiness reserved for them in a future state.

After the passing of their sentence, the man and woman were turned out into the world, where they had formerly lived before they were placed in the garden of Eden; and all future access to the garden was for ever denied them. They were not, however, in the same state in which they were originally before their introduction into Paradise: They were now conscious of guilt; doomed to severe labour; liable to sorrow and sickness, disease and death; and all these miseries they had brought, not only upon themselves, but also, as we learn from different passages of the New Testament, upon their unborn posterity to the end of time. It may seem indeed to militate against the moral attributes of God, to inflict misery upon children for the sins of their parents; but before any thing can be pronounced concerning the Divine goodness and justice in the present case, we must know precisely how much we suffer in consequence of Adam's transgression, and whether we have ourselves any share in that guilt which is the cause of our sufferings.

709
Doubtful whether men would have been exempted from pain under the first covenant,

That women would have had less sorrow in conception and in the bringing forth of children; that we should have been subjected to less toil and exempted from death, had our first parents not fallen from their paradisaical state—are truths incontrovertible by him who believes the inspiration of the Holy Scriptures; but that mankind would in that state have been wholly free from pain and every bodily distress, is a proposition which is not to be found in the Bible, and which therefore no man is bound to believe. The bodies of Adam and Eve consisted of flesh, blood, and bones, as ours do; they were surrounded by material objects as we are; and their limbs were unquestionably capable of being fractured. That their souls should never be separated from their bodies while they abtained from the forbidden fruit, they knew from the intallible promise of him who formed them, and breathed into their nostrils the breath of life; but that not a bone of themselves or of their numerous posterity should ever be broken by the fall of a stone or of a tree, they were not told, and had no reason to expect. Of such fractures, pain would surely have been the consequence; though we have reason to believe that it would have been quickly removed by some infallible remedy, probably by the fruit of the tree of life.

Perhaps it may be said, that if we suppose our first parents or their children to have been liable to accidents of this kind in the garden of Eden, it will be difficult to conceive how they could have been preserved from death, as a stone might have fallen on their heads as well as on their feet, and have at once destroyed the principle of vitality. But this can be said only by him who knows little of the physical world, and still less of the power of God. There

are many animals which are susceptible of pain, and yet not easily killed; and man in paradise might have resembled these. At any rate, we are sure that the Omnipotent Creator could and would have preserved him from death; but we have no reason to believe that, by a constant miracle, he would have preserved him from every kind of pain. Indeed, if, under the first covenant, mankind were in a state of probation, it is certainly conceivable that some one individual of the numerous race might have fallen into sin, without actually breaking the covenant by eating the fruit of the tree of knowledge; and such a sinner would undoubtedly have been punished by that God who is of purer eyes than to behold iniquity: but how punishment could have been inflicted on a being exempted from all possibility of pain as well as of death we confess ourselves unable to imagine. Remorse, which is the inseparable consequence of guilt, and constitutes in our present state great part of its punishment, flows from the fearful looking for of judgment, which the sinner knows shall, in a future state, devour the adversaries of the gospel of Christ; but he, who could neither suffer pain nor death, had no cause to be afraid of future judgment, and was therefore not liable to the tortures of remorse. We conclude, therefore, that it is a mistake to suppose pain to have been introduced into the world by the fall of our first parents, or at least that the opinion contrary to ours has no foundation in the word of God.

Death, however, was certainly introduced by their fall; ¹¹⁰ That of the inspired apostle assures us, that in *Adam all die* *; [†] they were from de- and again, that *through the offence of one many are dead* †. [†] I Co. x. 22. But concerning the full import of the word *death* in this place, and in the sentence pronounced upon our first parents, [†] Rom. v. 15. divines hold opinions extremely different. Many contend, that it includes death *corporal, spiritual, or moral and eternal*; and that all mankind are subjected to these three kinds of death, on account of their share in the guilt of the original transgression, which is usually denominated *original sin*, and considered as the source of all moral evil.

That all men are subjected to death corporal in consequence of Adam's transgression, is universally admitted; but that they are in any sense partakers of his guilt, and on that account subjected to death spiritual and eternal, has been very strenuously denied. To discover the truth is of great importance; for it is intimately connected with the Christian doctrine of redemption. We shall therefore state, with as much impartiality as we can, the arguments commonly urged on each side of this much agitated question: but should the reader perceive, as very probably he may, that we lean more to the one side than to the other, he will do well to shut our book, and, disregarding all artificial systems study, with an unbiassed mind, the writings only of the prophets and apostles.

Those who maintain that all men sinned in Adam, generally state their doctrine thus: "The covenant being made with Adam as a public person, not for himself only but for his posterity, all mankind descending from him by ordinary generation *sinned* in him and fell with him in that first transgression; whereby they are deprived of that original righteousness in which he was created, and are utterly indisposed, disabled, and made opposite to all that is spiritually good, and wholly inclined to all evil, and that continually; which is commonly called *original sin*, and from which do proceed all actual transgressions, so as we are by nature children of wrath, bond-slaves to Satan, and justly liable to all punishments in this world and in that which is to come, even to everlasting separation from the comfortable presence of God, and to most grievous torments in soul and body, without intermission, in hell *forever*."

That which in this passage we are first to examine, is the sentence

all of Adam, and its consequences.

172 Arguments for it.

Rom. v. 15-20.

Rom. i. 1. and 18. ii. 1. and 3.

Job xiv. and xv.

Psalm li.

173 Adam's guilt imputed to his posterity.

sentence which affirms all mankind descending from Adam by ordinary generation to have *sinned* in him and fallen with him in his first transgression; the truth of which is attempted to be proved by various texts of Holy Scripture. Thus St Paul says expressly, that "by one man sin entered into the world, and death by sin; and so death passed upon all men, for that *all have sinned*. But not as the offence, so also is the free gift. For if, through the *offence* of one, many be *dead*; much more the grace of God, and the gift by grace, which is by one man, Jesus Christ, hath abounded unto many; and not as it was by one that sinned, so is the gift (for the *judgment* was by one unto *condemnation*); but the free gift is of many offences unto justification. For if, by one man's offence, death reigned by one; much more they, who receive the abundance of grace and of the gift of righteousness, shall reign in life by one, Jesus Christ. Therefore as, by the *offence* of one, *judgment* came upon all men to *condemnation*; even so, by the righteousness of One, the free gift came upon all men unto justification of life. For as by one man's disobedience many were made sinners; so by the obedience of one shall many be made righteous†."

wise exhibits the apostle reasoning in such a manner as would, in their opinion, disgrace any man of common sense, and much more an inspired writer; for then the sense of these words, "Death hath passed upon all men, for that all have sinned," must be, death hath passed upon all men, because it hath passed upon all men; or, all men are obnoxious to death, because they are obnoxious to it. The only way therefore, continue they, in which Adam's posterity can be made sinners through his disobedience, is by the *imputation* of his disobedience to them; and this imputation is not to be considered in a *moral* sense, as the action of a man committed by himself, whether good or bad, is reckoned unto him as his own; but in a *forensic* sense, as when one man's debts are in a legal way placed to the account of another. Of this we have an instance in the apostle Paul, who said to Philemon concerning Onesimus, "If he hath wronged thee, or oweth thee any thing (ὀφειλὴν), let it be imputed to me," or placed to and put on my account. And thus the posterity of Adam are made sinners by his disobedience; that being imputed to them and put to their account, as if it had been committed by them personally, though it was not.

Some few divines of this school are indeed of opinion, that the phrase, "By one man's disobedience many were made sinners," means nothing more than that the posterity of Adam, through his sin, derive from him a corrupt nature. But though this be admitted as an undoubted truth, the more zealous abettors of the system contend, that it is not the whole truth. "It is true (say they) that all men are made of one man's blood, and that blood tainted with sin; and so a clean thing cannot be brought out of an unclean. What is born of the flesh is flesh, carnal and corrupt: every man is conceived in sin and shapen in iniquity; but then there is a difference between being *made sinners* and *becoming* sinful. The one respects the *guilt*, the other the *pollution* of nature; the one is previous to the other, and the foundation of it. Men receive a corrupt nature from their immediate parents; but they are made sinners, not by any act of their disobedience, but only by the imputation of the sin of Adam."

To confirm and illustrate this doctrine of imputed sin, they observe, that the word *καταλογίζω*, used by the apostle, signifies *constituted* in a judicial way, ordered and appointed in the dispensation of things that so it should be; just as Christ was made sin or a sinner by imputation, or by that constitution of God which laid upon him the sins of all his people, and dealt with him as if he had been the guilty person. That this is the sense of the passage, they argue further from the punishment inflicted on men for the sin of Adam. The punishment threatened to that sin was death; which includes death corporal, moral, and eternal. Corporal death, say they, is allowed by all to be suffered on account of the sin of Adam; and if so, there must be guilt, and that guilt made over to the sufferer, which can be done only by *imputation*. A moral death is no other than the loss of the image of God in man, which consisted in righteousness and holiness; and particularly it is the loss of original righteousness, to which succeeded unrighteousness and unholiness. It is both a sin and a punishment for sin; and since it comes upon all men as a punishment, it must suppose preceding sin, which can be nothing but Adam's disobedience; the guilt of which is made over to his posterity by *imputation*. This appears still more evident from the posterity of Adam being made liable to eternal death in consequence of his transgression; for the wages of sin, we are assured, is death, even death eternal, which never can be inflicted on guiltless persons. But from the passage before us we learn, that "by the offence of one judgment came upon

Fall of Adam, and its consequences.

174 The punishment of imputed guilt.

Fall of Adam, and its consequences.

all men to condemnation," and therefore the guilt of that offence must be reckoned to all men, or they could not be justly condemned for it. That Adam's sin is imputed to his posterity, appears not only from the words, "by one man's disobedience many were made sinners;" but likewise from the opposite clause, "so by the obedience of One shall many be made righteous;" for the many ordained to eternal life, for whom Christ died, are made righteous, or justified, only through the imputation of his righteousness to them; and therefore it follows, that all men are made sinners only through the imputation of Adam's disobedience.

Rom. v. 12.

Heb. vii. 9, 10.

115 Adam a federal head to his posterity. Rom. v. 14.

To this doctrine it is said to be no objection that Adam's posterity were not in being when his sin was committed; for though they had not then actual being, they had yet a virtual and representative one. They were in him both *seminally* and *federally*, and sinned in him*; just as Levi was in the loins of Abraham, and paid in him tithes to Melchizedeck †. From Adam, as their common parent, they derive a corrupt nature; but it is only from him, as their federal head, that they derive a share of his guilt, and are subjected to his punishment. That he was a federal head to all his posterity, the divines of this school think evident from his being called a figure of Christ ‡; and the first Adam described as natural and earthly, in contradistinction to Christ the second Adam described as spiritual and the Lord from heaven: and from the punishment threatened against his sin being inflicted not on himself only, but on all his succeeding offspring. He could not be a figure of Christ, say they, merely as a man; for all the sons of Adam have been men as well as he, and in that sense were as much figures of Christ as he; yet Adam and Christ are constantly contrasted, as though they had been the only two men that ever existed, because they were the only two heads of their respective offspring. He could not be a figure of Christ on account of his extraordinary production; for though both were produced in ways uncommon, yet each was brought into the world in a way peculiar to himself. The first Adam was formed of the dust of the ground; the second, though not begotten by a man, was born of a woman. They did not therefore resemble each other in the manner of their formation, but in their office as covenant-heads; and in that alone the comparison between them is exact.

116 No cause of complaint in this constitution of things.

Nor have any of the posterity of Adam, it is said, reason to complain of such a procedure. Had he stood in his integrity, they would have been, by his standing, partakers of all his happiness; and therefore should not murmur at receiving evil through his fall. If this do not satisfy, let it be considered, that since God, in his infinite wisdom, thought proper that men should have a head and representative, in whose hands their good and happiness should be placed, none could be so fit for this high station as the common parent, made after the image of God, so wise, so holy, just, and good. Lastly, to silence all objections, let it be remembered, that what God gave to Adam as a federal head, relating to himself and his posterity, he gave as the Sovereign of the universe, to whom no created being has a right to ask, "What dost thou*?"

* See Gill's Body of Divinity.

Such are the consequences of Adam's fall, and such the doctrine of original sin, as maintained by the more rigid followers of Calvin. That great reformer, however, was not the author of this doctrine. It had been taught, so early as in the beginning of the fifth century, by St Augustine, the celebrated bishop of Hippo (see AUGUSTINE); and the authority of that father had made it more or less prevalent in both the Greek and Roman churches long before the Reformation. Calvin was indeed the most eminent modern divine by whom it has been held in all its rigour;

117 St Augustine the author of this doctrine.

and it constitutes one great part of that theological system which, from being taught by him, is now known by the name of *Calvinism*. Those by whom it is embraced maintain it with zeal, as, in their opinion, forming, together with the other tenets of their master, the only pure system of evangelical truths; but it hath met with much opposition in some of the Lutheran churches, as well as from private divines in the church of England, and from the great body of Dutch reformed (see CALVINISM, ARMINIANS, and SYNOD OF DORT); and of their objections it is now our duty to give a candid view, as well as of the doctrine which they substitute in its stead.

Fall of Adam, and its consequences.

118 Objections to 11.

They begin then with alleging, that if it was as sovereign of the universe that God gave to Adam what he received in paradise relating to himself and his posterity, Adam could in no sense of the words be a federal head; because, upon this supposition, there was no covenant. The Sovereign of the Universe may unquestionably dispense his benefits, or withhold them, as seems expedient to his infinite wisdom; and none of his subjects or creatures can have a right to say to him, What dost thou? But the dispensing or withholding of benefits is a transaction very different from the entering into covenants; and a judgment is to be formed of it upon very different principles. Every thing around us proclaims that the Sovereign of the Universe is a being of perfect benevolence; but, say the disciples of the school now under consideration, the dispensation given to Adam in paradise was so far from being the offspring of benevolence, that, as it is understood by the followers of Calvin, it cannot possibly be reconciled with the eternal laws of equity. The self-existent and all-sufficient God might or might not have created such a being as man; and in either case there would have been no reason for the question "What dost thou?" But as soon as he determined to create him capable of happiness or misery, he would not have been either benevolent or just, if he had not placed him in a state where, by his own exertions, he might, if he chose, have a greater share of happiness than of misery, and find his existence, upon the whole, a blessing. They readily acknowledge, that the existence of any created being may be of longer or shorter duration, according to the good pleasure of the Creator; and therefore they have no objection to the apostolic doctrine, that "in Adam all die:" for immortality being not a debt, but a *free gift*, may be bestowed upon any terms whatever, and with perfect justice withdrawn when these terms are not complied with. Between death, however, as it implies a loss of consciousness, and the extreme misery of eternal life in torments, there is an immense difference. To death all mankind might justly be subjected through the offence of one; because they had originally no claim of right to be exempted from it, though that one and they too had remained for ever innocent: but eternal life in torments is a punishment which a God of justice and benevolence can never inflict but upon personal guilt of the deepest die. That we can personally have incurred guilt from a crime committed some thousands of years before we were born, is impossible. It is indeed a notion, if such a notion can be formed, as contrary to Scripture as to reason and common sense: for the apostle expressly informs us*, * 1 John iii. "that sin is the transgression of some law;" and the sin of Adam was the transgression of a law which it was never in our power either to observe or to break. Another apostle † † Rom. iv. assures us, that "where no law is, there is no transgression;" † 15. but there is now no law, nor has been any these 5000 years, forbidding mankind to eat of a particular fruit; for, according to the Calvinists themselves ‡, Adam had no sooner committed his first sin, by which the covenant with him was broken, than he ceased to be a covenant-head. The law

119 As inconsistent with the justice of God.

Gill's Body of Divinity, book iii. ch. 10.

all of Adam, and its consequences.

given him was no more; the promise of life by it ceased; and its sanction, death, took place. But if this be so, how is it possible that his unborn posterity should be under a law which had no existence, or that they should be in a worse state in consequence of the covenant being broken, and its promise having ceased, than he himself was before the covenant was first made? He was originally a mortal being, and was promised the supernatural gift of immortality on the single condition of his abstaining from the fruit of the tree of knowledge of good and evil. From that fruit he did not abstain; but by eating it fell back into his natural state of mortality. Thus far it is admitted that his posterity fell with him; for they have no claim to a supernatural gift which he had forfeited by his transgression. But we cannot admit, say the divines of this school, that they fell into his guilt; for to render it possible for a man to incur guilt by the transgression of a law, it is necessary not only that he have it in his power to keep the law, but also that he be capable of transgressing it by a *voluntary* deed. But surely no man could be capable of voluntarily eating the forbidden fruit 5000 years before he himself or his volitions existed. The followers of Calvin think it a sufficient objection to the doctrine of transubstantiation, that the same numerical body cannot be in different places at the same instant of time. But this ubiquity of body, say the remonstrants, is not more palpably absurd, than the supposition that a man could exert volitions before he or his will had any existence. If indeed there be any difference between the two cases, it is in favour of the Catholic doctrine of the real presence; for we are by no means so intimately acquainted with the internal substance of body, and what can be predicated of it, as we are with the nature of guilt and the exercise of volition. These we know thoroughly as they really are in themselves; the former only relatively as it is seen in its qualities.

Nor will the introduction of the word *imputation* into this important question remove a single difficulty. For what is it that we mean by saying that the sin of Adam is imputed to his posterity? Is the guilt of that sin transferred from him to them? So surely thought Dr Gill, when he said that it is *made over to them*. But this is the same absurdity as the making over of the sensible qualities of bread and wine to the internal substance of our Saviour's body and blood! This imputation either found the posterity of Adam guilty of his sin, or it made them so. It could not find them guilty for the reason already assigned; as well as because the apostle says expressly, that for the offence of *one* judgment came upon *all* men, which would not be true had *all* offended. It could not make them guilty; for this reason, that if there be in physics or metaphysics a single truth self-evident, it is, that the numerical powers, actions, or qualities, of one being cannot possibly be transferred to another, and be made its powers, actions, or qualities. Different beings may in distant ages have qualities of the same kind; but as easily may 4 and 3 be made equal to 9, as two beings be made to have the same identical quality. In Scripture we nowhere read of the actions of one man being imputed to another. "Abraham (we are told) believed in God, and it was counted to him for righteousness;" but it was his *own* faith, and not the faith of another man, that was so counted. "To him that worketh not, but believeth, his faith (not another's) is imputed for righteousness." And of our faith in him that raised Christ from the dead, it is said, that "it shall be imputed, not to our fathers or our children, but to us for righteousness."

When this phrase is used with a negative, not only is the man's own personal sin spoken of, but the non-imputation of that sin means nothing more but that it brings not upon the sinner condign punishment. Thus when Shimei "said

unto David, Let not my lord *impute* iniquity unto me;" it could not be his meaning that the king should not think that he had offended; for with the same breath he added, "Neither do thou remember that which thy servant *did* *perverse*ly, the day that my lord the king went out of Jerusalem, that the king should take it to his heart. For thy servant doth *know* that *I have sinned*." Here he plainly confesses his sin, and declares, that by intreating the king not to *impute it to him*, he wished only that it should not be so remembered as that the king should take it to heart, and punish him as his perverseness deserved. When therefore it is said *, that "God was in Christ reconciling the world to himself, not imputing to them their iniquities, the meaning is only that for Christ's sake he was pleased to exempt them from the punishment due to their sins. In like manner, when the prophet, foretelling the sufferings of the Messiah, says, that "the Lord laid on him the iniquity of us all," his meaning cannot be, that the Lord by *imputation* made his immaculate Son guilty of all the sins that men have ever committed; for in that case it would not be true that the "just suffered for the unjust," as the apostle expressly teaches †: but the sense of the verse must be as Bishop Coverdale translated it, "through him the Lord pardoneth all our sins." This interpretation is countenanced by the ancient version of the Seventy, *καὶ ὁ κύριος παρέδωκεν αὐτὸν ταῖς ἀμαρτίαις ἡμῶν*; words which express a notion very different from that of imputed guilt. The Messiah was, without a breach of justice, delivered for sins of which he had voluntarily offered to pay the penalty; and St Paul might have been justly charged by Philemon with the debts of Onesimus, which he had desired might be placed to his account. Had the apostle, however, expressed no such desire, surely Philemon could by no deed of his have made him liable for debts contracted by another; far less could he by *imputation*, whatever that word may mean, have made him virtually concur in the contracting of those debts. Just so it seems to be with respect to the sufferings of Christ for the sins of men: He could not have been justly subjected to suffering without his own consent; and he could not possibly have been made guilty of the sins of those for whom he suffered.

The doctrine of imputed guilt therefore, as understood by the Calvinists, is, in the opinion of their opponents, without foundation in Scripture, and contrary to the nature of things. It is an impious absurdity (say they), to which the mind can never be reconciled by the hypothesis, that all men were in Adam both seminally and federally, and sinned in him, as Levi paid tithes to Melchizedeck in the loins of Abraham. The apostle, when he employs that argument to lessen in the minds of his countrymen the pride of birth and the lofty opinions entertained of their priesthood, plainly intimates, that he was using a bold figure, and that Levi's paying tithes is not to be understood in a strict and literal sense. "Now consider (says he) how great this man was, unto whom even the patriarch Abraham gave the tenth of the spoils. And, *as I may so say*, Levi also, who receiveth tithes, paid tithes in Abraham: for he was yet in the loins of his father when Melchizedeck met him." This is a very good argument to prove that the Levitical priesthood was inferior in dignity to that of Melchizedeck; and by the apostle it is employed for no other purpose. Levi could not be greater than Abraham, and yet Abraham was inferior to Melchizedeck. This is the whole of St Paul's reasoning, which leads no support to the doctrine of original sin, unless it can be shown that Levi and all his descendants contracted from this circumstance such a strong propensity to the *paying* of tithes, as made it a matter of extreme difficulty for them, in every subsequent generation, to

Fall of Adam, and its consequences.

Fall of Adam, and its consequences.

to comply with that part of the divine law which constituted them *receivers* of tithes. That all men were feminally in Adam, is granted; and it is likewise granted that they may have derived from him, by ordinary generation, diseased and enfeebled bodies: but it is as impossible to believe that moral guilt can be transmitted from father to son by the physical act of generation, as to conceive a scarlet colour to be a cube of marble, or the sound of a trumpet a cannon ball. That Adam was as fit a person as any other to be entrusted with the good and happiness of his posterity, may be true; but there is no fitness whatever, according to the Arminians, in making the everlasting happiness or misery of a whole race depend upon the conduct of any fallible individual. "That any man should so represent me (says Dr Taylor *), that when he is guilty, I am to be reputed guilty; when he transgresses, I shall be accountable and punishable for his transgression; and this before I am born, and consequently before I am in any capacity of knowing, helping, or hindering, what he doth: all this every one who useth his understanding must clearly see to be false, unreasonable, and altogether inconsistent with the truth and goodness of God." And that no such appointment ever had place, he endeavours to prove, by showing that the texts of Scripture upon which is built the doctrine of the Calvinists respecting original sin, will each admit of a very different interpretation.

• Doctrine of Original Sin, Part III.

The several reasons which this doctrine is built upon of a different interpretation.

One of the strongest of these texts is Romans v. 19. which we have already quoted, and which our author thus explains. He observes, that the apostle was a Jew, familiarly acquainted with the Hebrew tongue; that he wrote his epistle as well for the use of his own countrymen residing in Rome, as for the benefit of the Gentile converts; and that though he made use of the Greek language, as most generally understood, he frequently employed Hebrew idioms. Now it is certain that the Hebrew words *חטא* and *פשע*, "sin and iniquity," are frequently used in the Old Testament to signify *suffering*, by a figure of speech which puts the effect for the cause; and it is surely more probable, that in the verse under consideration, the apostle used the corresponding Greek word *ἀμαρτωλοι* in the same Hebrew sense, than that he meant to contradict what he had said in the former verse, by teaching that all men were made guilty of an act of disobedience committed thousands of years before the majority of them had any being. In the preceding verse he says, "that by the offence of one, judgment came upon all men to condemnation." But this cannot be true, if by that offence all men were made sinners; for then judgment must have come upon each for his own share in the original disobedience. "Any one may see (says our author) that there is a vast difference between a man's making *himself* a sinner by his *own* wicked act, and his being made a sinner by the wicked act of *another*. In the latter case, he can be a sinner in no other sense but as he is a sufferer; just as Lot would have been made a sinner with the Sodomites, had he been consumed in the iniquity of the city ϕ ; and as the subjects of Abimelech would have been made sinners, had he, in the integrity of his heart, committed adultery with Abraham's wife *." That the people of Gerar could have contracted any real guilt from the

§ Gen. xix. 11. * Gen. 12.

adultery of their sovereign, or that he, by lying with a woman whom he had reason to believe to be not the wife but the sister of another man, would have incurred all the moral turpitude of that crime, are positions which cannot be maintained. Yet he says, that Abraham had brought upon him and on his kingdom a *great sin*; though it appears, from comparing the 6th verse with the 17th and 18th, that he had not been brought under sin in any other sense than as he was made to suffer for taking Sarah into his house. In this sense, "Christ, though we are sure that he knew no sin, was made sin for us, and numbered with the transgressors," because he suffered death for us on the cross; and in this sense it is true, that by the disobedience of Adam all mankind were made sinners, because, in consequence of his offence, they were by the judgment of God made subject to death.

But it may be thought that this interpretation of the words *sin* and *sinners*, though it might perhaps be admitted in the 19th verse, cannot be supposed to give the apostle's real meaning, as it would make him employ in the 12th verse an absurd argument, which has been already noticed. But it may perhaps be possible to get quit of the absurdity, by examining the original text instead of our translation. The words are, *καὶ ὅτις ἐστὶν πάντας ἀνθρώπους ὁ θανάτος ἐκλήθη, ἐπὶ ᾧ πάντες ἥμαρτον*. In order to ascertain the real sense of these words, the first thing to be done is to discover the antecedent to the relative ϕ . Our translators seem to consider it as used absolutely without any antecedent; but this is inaccurate, as it may be questioned whether the relative was ever used in any language without an antecedent either expressed or understood. Accordingly, the Calvinist critics, and even many Remonstrants, consider *ἰνός ἀνθρώπου* in the beginning of the verse as the antecedent to ϕ in the end of it, and translate the clause under consideration thus: "And so death hath passed upon all men, in whom (*viz.* Adam) all have sinned." *θανάτος*, however, stands much nearer to ϕ than *ἀνθρώπου*; and being of the same gender, ought, we think, to be considered as its real antecedent: but if so, the clause under consideration should be thus translated: "and so death hath passed upon all men, unto which (*o*) all have sinned, or, as the Arminians explain it, have suffered. If this criticism be admitted as just, *ἐπὶ* must be considered as standing here under a particular emphasis, denoting the utmost length of the consequences of Adam's sin (*p*); as if the apostle had said, "so far have the consequences of Adam's sin extended, and spread their influence among mankind, introducing not only a curse upon the earth, and sorrow and toil upon its inhabitants, but even DEATH, UNIVERSAL DEATH, in every part, and in all ages of the world." His words (say the Remonstrants) will unquestionably bear this sense; and it is surely much more probable that it is their true sense, than that an inspired writer should have taught a doctrine subversive of all our notions of right and wrong, and which, if really embraced, must make us incapable of judging when we are innocent and when guilty.

When the apostle says that there is none righteous, no not one, he gives us plainly to understand that he is quoting from the 14th Psalm; and the question to be first answered is, In what sense were these words used by the Psalmist?

(o) That *ἰνός*, when construed with a dative case, often signifies *to* or *unto*, is known to every Greek scholar. Thus *ἰνὸς ἐξ ἑδός*, *the way to fame*, (Lucian.) *Καὶ ὁμοίως ἐστὶ τῷ θανάτῳ*, *a criminal unto death*, (Demosth.) *Ἐπὶ θανάτῳ συλλαβῆς*, *to carry to death or execution*, (Isoc.) *Τῆς ἐπιλευθερίας ἐκλήθητι*, *ye have been called to liberty*, (Gal. v. 13.) *Κτισθεὶς ἐν Χριστῷ Ἰησοῦ ἐπὶ ἰργῶν ἀγαθῶν*, *created in Christ Jesus unto good works*, (Ephes. ii. 10.) See also 1 Thes. iv. 7.; 2 Tim. ii. 14.; and many other places of the New Testament.

(p) *Ἐπὶ* ϕ has likewise this import, denoting the *terminus ad quem* in Phil. iii. 12. and iv. 10.

mi! ? That they were not meant to include all the men and women then living, far less all that have ever lived, is plain from the fifth verse of the same Psalm, where we are told that those wicked persons "were in great fear, because God was in the congregation of the *righteous*." There was then, it seems, a congregation of righteous persons, in opposition to those called the *children of men*, of whom alone it is said that there was none that did good, no not one. The truth is, that the persons of whom David generally complains in the book of Psalms, constituted a strong party disaffected to his person and government. That faction he describes as proud and oppressive, as devising mischief against him, as violent men continually getting together for war. He styles them his *enemies*; and sometimes characterizes them by the appellation which was given to the apostate descendants of Cain before the deluge. Thus in the 57th Psalm, which was composed when he fled from Saul to the cave in which he spared that tyrant's life, he complains, "I lie among them that are set on fire, even the *sons of men*, whose teeth are spears," &c. ; and again, in the 58th Psalm, he says, "Do ye indeed speak righteousness, O congregation? Do ye judge uprightly, O ye sons of men?" By comparing these texts with 1 Sam. xxvi. 19. it will appear evident beyond dispute, that by the *sons of men* mentioned in them, he meant to characterize those enemies who exasperated Saul against him. Now it is well known, that there was a party adhering to the interests of the house of Saul which continued its enmity to David during the 40 years of his reign, and joined with Absalom in rebellion against him only eight years before his death. But it is the opinion of the most judicious commentators, that the 14th Psalm was composed during the rebellion of Absalom; and therefore it is surely much more probable, that by the *children of men*, of whom it is said there is "none that doth good, no not one," the inspired poet meant to characterize the rebels, than that he should have directly contradicted himself in the compass of two sentences succeeding each other. Had he indeed known that all the children of men, as descending from Adam, "are utterly indisposed, disabled, and made opposite to all that is spiritually good, and wholly and continually inclined to all evil," he could not, with the least degree of consistency, have represented the Lord as looking down from heaven upon them, to see if there were any that did understand and seek after God; but if by the children of men was meant only the rebel faction, this scenical representation is perfectly consistent, as it was natural to suppose that there might be in that faction some men of good principles misled by the arts of the rebel chiefs.

Having thus ascertained the sense of the words as originally used by the Psalmist, the Arminian proceeds to inquire for what purpose they were quoted by the apostle; and in this inquiry he seems to find nothing difficult. The aversion of the Jews from the admission of the Gentiles to the privileges of the gospel, the high opinion which they entertained of their own worth and superiority to all other nations, and the strong persuasion which they had that a strict obedience to their own law was sufficient to justify them before God, are facts universally known; but it was the purpose of the apostle to prove that all men stood in need of a Redeemer, that Jews as well as Gentiles had been under the dominion of sin, and that the one could not in that respect claim any superiority over the other. He begins his epistle, therefore, with showing the extreme depravity of the Heathen world; and having made good that point, he proceeds to prove, by quotations from the book of Psalms, Proverbs, and Isaiah, that the Jews were in nowise better than they, that every mouth might be stopped, and all the world be-

come guilty, or insufficient for their own justification before God.

The next proof brought by the Calvinists in support of their opinion, that all men derive guilt from Adam by ordinary generation, is that text in which St Paul says that the Ephesians "were by *nature* children of wrath even as others." To this their opponents reply, that the doctrine of original sin is in this verse, as in the last quoted, countenanced only by our translation, and not by the original Greek as understood by the ancient fathers of the Christian church, who were greater masters of that language than we. The words are *καὶ ἡμεῖς τέκνα θυμῶν ὀργῆς*; in which it is obvious, that *τέκνα*, though in its original sense it signifies the genuine children of parents by natural generation, cannot be so understood here; because no man was ever begotten by, or born of, the abstract notion *wrath*. It must therefore be used figuratively; and in other places of scripture it often denotes a close relation to any person or thing. Thus we read of the children of *God*, of the *kingdom*, of the *resurrection*, of *wisdom*, of *light*, of *obedience*, and of *peace*; whence it is concluded, that by the children of wrath are meant those who are liable to punishment or rejection. And because there were in those days some children, in a lower and less proper sense, by *adoption*, and others, in a higher and more proper sense, by *natural generation*, of whom the relation of the latter to their parents was much closer than that of the former; the apostle tells the Ephesians, that they were by *nature* children of wrath, to convince them that they were *really* liable to it by the strictest and closest relation possible. That the word *θυμῶν* here is of the same import with *really* or *truly*, and that it does not signify what we mean by *nature* in the proper sense of that word, the ancient fathers are generally agreed*; and that the modern Greeks, who still speak a dialect of the noble language of their ancestors, understand the word in the same sense, is apparent from their version of the text before us. In the most correct and elegant edition of the New Testament in their vernacular tongue, the words under consideration are thus rendered; *καὶ συνημαθὲν ἡμεῖς ὅσταν τέκνα ὀργῆς ὄσαν καὶ εἰς ἡμῶν*, where it is impossible that *συνημαθὲν* can signify *natural*, otherwise the apostle will be made to say, not that we are by the nature derived from Adam liable to wrath, but that we were *naturally begotten* by *wrath* in the abstract! For taking the word *θυμῶν* in the sense of *really* or *truly*, both the ancient and modern Greeks appear indeed to have the authority of St Paul himself; who, writing to Timothy, calls him *ἑστὸν τέκνον* "his true or genuine son;" not to signify that he was the child of the apostle by natural generation, but that he was closely related to him in the faith to which St Paul had converted him. That the words *τέκνα θυμῶν ὀργῆς* can signify nothing but *truly* or *really relations to wrath*, is still farther evident from the ground assigned of that relation. It is not the sin of Adam, or the impurity of natural generation, "but the trespasses and sins in which the Ephesians in time past *walked*, according to the course of the world, according to the prince of the power of the air," the spirit that at the time of the apostle's writing "worked in the children of disobedience." Surely no man can suppose that the Ephesians at any past time *walked* in Adam's trespass and sin, or that the prince of the power of the air tempted them to eat the forbidden fruit.

Having thus commented on the principal texts which are cited from the New Testament to prove the doctrine of original sin, the Arminians treat those which are quoted from the Old Testament, in support of the same doctrine, with much less ceremony. Thus, when Job says, "who

Fall of Adam, and its consequences.

* See Hammond and Wilby on the Text, and Swicker on the word θυμῶν.

Job of Adam and its consequence.

can bring a clean thing out of an unclean? Not one," he is speaking, say they, not of the pravity of our nature, but of its frailty and weakness, of the shortness and misery of human life. The sentence is proverbial; and as it is used only to signify, that nothing can be more perfect than its original, it must, whenever it occurs, be understood according to the subject to which it is applied. That in the place under consideration it refers to our mortality, they think plain from the context; and Dr Taylor adds*, with some plausibility, that if the words refer to the guilt which we are supposed to derive from Adam, they will prove too much to serve the common scheme of original sin. They will prove that our natural and inherent pravity, so far from rendering us fit subjects of wrath, may be urged as a reason why God should not even bring us into judgement; for the patriarch's whole expostulation runs thus, "Dost thou open thine eyes upon such a one, and bringest me into judgment with thee? Who can bring a clean thing out of an unclean?"

* Scripture Divine, part. II.

The other text, quoted from the same book, they think still less to the purpose; for Eliphaz is evidently contrasting the creature with the Creator; in comparison with whom, he might well say, without alluding to original guilt, "what is man that he should be clean? and he who is born of a woman that he should be righteous? Behold he putteth no trust in his saints; yea the heavens are not clean in his sight. How much more abominable and filthy is man, who drieth iniquity like water?" He does not say, who derives by birth an iniquitous nature; for he knew well, that as we are born, we are the pure workmanship of God, "whose hands have fashioned and formed every one of us;" but "who drieth iniquity like water," who maketh himself iniquitous by running headlong into every vicious practice.

† Uti Suet.

Of the text quoted from the fifty-first psalm in support of the doctrine of original sin, Dr Taylor labours †, by a long and ingenious criticism, to prove that our translators have mistaken the sense. The word which they have rendered *shapen*, he shews to be used once by Isaiah, and twice in the book of Proverbs, to signify *brought forth*; and that which is rendered *conceived me*, is never, he says, employed in scripture to denote human conception. In this last remark, however, he is contradicted by a great authority, no less indeed than that of Mr Parkhurst ‡, who says, that the LXX constantly render it by *γεννησθαι* or *γεννησθαι*, and the Vulgate generally by *concipio*. Without taking upon us to decide between these two eminent Hebrew scholars, we shall only observe, that upon one occasion || it certainly denotes ideas much grosser than those which the Psalmist must have had of his mother's conception; and that there, at least, Dr Taylor properly translates it *incalcesebant*, adding, "de hoc vero incalcescendi genere loqui Davidem nemo sanus exillimare potest. Matrem enim incaluisse, aut ipsum eale ecclesie eo modo quo incalcescerent Jacobi pecudes Regem dicere, prorsus indecorum et absurdum." He contends, however, that the original force of the word is to be hot, and that it is applied to *conception*, to *resentment*, to *warmth* by which the body is nourished, to *idolaters* in love with idols, and to the heat of metals. The heat of idolaters, of resentment, and of metals, are evidently foreign to the Psalmist's purpose; and the idea conveyed by the word *incalcescere* being set aside for the reasons already assigned, there remains only the warmth by which the body is nourished, and of that warmth our author is confident that David spoke.

‡ See his Lexicon on the word *γεννησθαι*.

§ Gen. xxv. 28, 29, 40. compared with xxxi. 10.

If this criticism be admitted, the whole verse will then run thus: "Behold I was born in iniquity, and in sin did my

mother nurse me;" which hath no reference to the original formation of his constitution, but is a periphrasis of his being a *finer from the womb*, and means nothing more than that he was a *great finner*, or had contracted *early habits* of sin. He no more designed to signify in this verse, that by ordinary generation he had a nature conveyed to him which was "utterly indisposed, disabled, and opposite to all that is spiritually good, and wholly and continually inclined to evil," than he meant in another † to signify ‡ strictly and properly that "the wicked are estranged from the womb, and TELL LIPS as soon as they are born;" or than Job meant to signify ||, that from the moment he came from his mother's womb he had been a guide to the widow and a succour to the fatherless. All these are hyperbolical forms of expression; which, though they appear strained, and perhaps extravagant, to the phlegmatic inhabitants of Europe, are perfectly suited to the warm imaginations of the orientals, and to the genius of eastern languages. They mean not that Job was *born with habits of virtue*, that the wicked actually *walked*, and *spoke*, and *spoke lies* from the instant of their *birth*, or that the Psalmist was really *shapen in sin* and *conceived in iniquity*. This last sentence, if interpreted literally, would indeed be grossly impious: it would make the inspired penman throw the whole load of his iniquity and sin from off himself upon *him* who shaped and upon *her* who conceived him; even upon that God "whose hands had made him and fashioned him, and whom he declares that he will praise for having made him fearfully and wonderfully," and upon that parent who conceived him with sorrow, and brought him forth with pain, and to whom the divine law commanded him to render honour and gratitude. "But if, after all (says Dr Taylor*), you will adhere to the literal sense of the text for the common doctrine of *original sin*, shew me any good reason why you ought not to admit the literal sense of the text, *this is my body*, for *transubstantiation*? If you say, it is absurd to suppose that Christ speaks of his real natural body; I say, it is likewise absurd to suppose that the Psalmist speaks of his being really and properly shapen in iniquity, and conceived in sin. If you say, that the sense of the words *this is my body* may be clearly explained by other texts of scripture where the like forms of speech are used; I say, and have shewn, that the Psalmist's sense may as clearly and evidently be made out by parallel texts, where you have the like kind of expression. If you say that transubstantiation is attended with consequences hurtful to piety, I say that the common doctrine of original sin is attended with consequences equally hurtful; for it is a principle apparently leading to all manner of iniquity to believe that sin is natural to us, that it is interwoven and ingrafted into our very constitution from our conception and formation in the womb."

The Arminians having thus, as they think, proved that the posterity of Adam are not in any sense rendered guilty by his sin, contend, that the death threatened against his eating of the forbidden fruit, and which, in consequence of his transgression, came upon all men, can mean nothing more than the loss of that vital principle which he received when God breathed into his nostrils the breath of life, and he became a living soul. Every thing beyond this is pure conjecture, which has no foundation in the scriptures of truth, and is directly contrary to all the notions of right and wrong which we have been able to acquire from the study of those very scriptures. It is not conceivable from any thing in the history, that Adam could understand it of the loss of any other life than that which he had lately received, for no other life is spoken of to which the threatened death can be opposed; and in such circumstances it was strange

Fall of Adam, and its consequences.

strange indeed, if by the word death he understood either eternal life in misery, or a necessity of continuing in sin. The sense therefore of the threatening, say they, is this; "I have formed thee of the dust of the ground, and breathed into thy nostrils the breath of life; and thus thou art become a living soul. But if thou eatest of the fruit of the tree of knowledge of good and evil, thou shalt cease to be a living soul; for I will take from thee the breath of life, and thou shalt return to the dust of which thou wast formed."

Thus far the Arminians of the present day (Q) are agreed in opposing the doctrine of the rigid Calvinists, and in stating their own notions of the consequences of Adam's fall; but from that event their adversaries deduce one consequence, which some of them admit and others deny. It is said, that though we cannot possibly be partakers in Adam's guilt, we yet derive from him a moral-taint and infection, by which we have a natural propensity to sin; that having lost the image of God, in which he was created, Adam begat sons in his own image; and in one word, that the sensual appetites of human nature were inflamed, and its moral and intellectual powers greatly weakened by the eating of the forbidden fruit. The heathens themselves acknowledged and lamented this depravity, though they were ignorant of the source from which it sprung. The scriptures assert it, affirming that no man can be born pure and clean; that whatever is born of the flesh, or comes into the world by ordinary generation, is flesh, carnal and corrupt; that the imagination of the thoughts of man's heart is only evil continually; that the heart is deceitful above all things and desperately wicked; and that out of it proceeds all that is vile and sinful.

This depravity of human nature, thus clearly deducible from scripture, and confirmed by the testimony of ages, an ingenious writer of the moderate Arminian school undertakes to illustrate upon the principles of natural knowledge. "We know (says he), that there are several fruits in several parts of the world of so noxious a nature as to destroy the best human constitution upon earth. We also know that there are some fruits in the world which inflame the blood into fevers and frenzies; and we are told that the Indians are acquainted with a certain juice, which immediately turns the person who drinks it into an idiot, leaving him at the same time in the enjoyment of his health and all the powers of this body. Now I ask, Whether it is not possible, nay whether it is not rational, to believe, that the same fruit, which, in the present infirmity of nature, would utterly destroy the human constitution, might, in its highest perfection, at least disturb, impair, and disease it? and whether the same fruit, which would now in-

flame any man living into a fever or a frenzy, might not inflame Adam into a turbulence and irregularity of passion and appetite? and whether the same fluids, which inflame the blood into irregularity of passion and appetite, may not naturally produce infection and impair the constitution? That the forbidden fruit had the effect to produce irregularity of appetite, appears as from other proofs, so I think fully and clearly from the covering which Adam and Eve made use of soon after their offence; for there is no imaginable reason for that covering but one, and that one sufficiently demonstrates, that irregularity and violence of appetite, independent of the dominion of reason, was the effect of their offence. But the fruit which inflamed the sensual appetite might likewise debase their rational powers; for I ask, whether the same juice, which now affects the brain of an ordinary man so as to make him an idiot, might not affect the brain of Adam so as to bring his understanding down to the present standard of ordinary men? And if this be possible, and not absurd to be supposed, it is evident that the subsequent ignorance and corruption of human nature may be clearly accounted for upon these suppositions; nay, I had almost said upon any one of them. For it is universally known, that the infections and infirmities of the father affect the children yet in his loins; and if the mother be equally infected, must, unless removed by proper remedies, affect their posterity to the end of the world, or at least till the race become extinct. Therefore why all mankind might not by their first father's sin be reduced to the same condition of infirmity and corruption with himself, especially when the mother was equally infirm and infected, I believe no man any way skilled in the knowledge of nature will so much as pretend to say."

This account of the corruption of human nature seems to be generally adopted by moderate divines, as well among the Calvinists as among the Arminians; but by the high-fliers in both schools it is rejected, upon different principles indeed, with great indignation. The zealous Calvinist contends, that this hereditary corruption is not to be accounted for or attempted to be explained by any principle of physical science, since it is part of that punishment which was inflicted on the race for their original sin. If we were not partakers of Adam's guilt, say they, we should not have been partakers of his corruption. The one is previous to the other, and the foundation of it. The depravity of human nature is a punishment for sin; and so it was threatened to Adam, and came upon him as such, and so to all his posterity, by the ordination and appointment of God; for which there can be no other foundation but the imputation of Adam's disobedience to them, nor can any thing else vindicate the righteousness of God. For if the law of nature

(Q) We say the Arminians of the present day; because in the beginning of this century many of them having imbibed the scholastic notion of the natural and essential immortality of the soul, seem to have been at a loss to conceive how it was to have been disposed of, had there been no redemption from Adam's curse. They were persuaded, that for his sin the souls of his posterity did not deserve eternal punishment; and as eternal life is everywhere in the New Testament represented as the gift of God through Jesus Christ, they thus expressed themselves concerning the death incurred by the fall of Adam. "It is well to be observed, that the death wherewith God threatened man as his punishment if he broke the covenant, is not in reason to be understood of eternal death, any farther than as by eternal death may be signified only the eternal separation of the soul from the body, and also the eternal exclusion of the soul from God, or heavenly bless." That the death threatened implied the annihilation of the soul, seems never to have occurred to them, though the apostle expressly says, that if there be no resurrection, "then they who are fallen asleep in Christ are perished, and are lost." They supposed that the sin of Adam would have separated the soul from the body, and excluded the former both from heaven and from hell; but what would have become of it in that state of exclusion, both from future happiness and future misery, we do not remember at present that any one of them has hazarded a conjecture. See Dr Wells's Help for the Right Understanding of the Several Divine Laws and Covenants; and bishop Bull's Harmonica Apologetica, with its several defences.

ture was sufficient, why should this original taint infect men rather than the sins of their immediate parents †?"

The more violent Arminians, on the other hand, deny that we inherit any moral taint whatever from Adam, or that the rational powers of our minds are naturally weaker than his were. Of that wonderful degree of perfection which is usually attributed to the first pair, they find no evidence in scripture. All that we learn of them, say they, is, that they fell from a state of exquisite happiness by yielding to a temptation less powerful by far than some others which many of their degenerate sons have successfully resisted.

"I leave you to judge (says Dr Taylor †), whether Joseph, when he resisted the solicitations of his mistress, and Moses when he refused to be called the son of Pharaoh's daughter, choosing rather to suffer affliction with the people of God than to enjoy the pleasures of sin for a season, esteeming the reproach of true religion greater riches than the treasures of Egypt, did not exhibit proofs of regularity of passions and appetites equal at least to what Adam displayed in the garden of Eden. When the three young men mentioned in the book of Daniel submitted to be burnt alive in a fiery furnace rather than worship Nebuchadnezzar's golden image; when Daniel himself resolved, rather than conceal the worship of God for one month only of his life, to be torn in pieces by hungry lions; and, to come nearer to our own times, when numbers of men and women, during the reign of Mary Queen of England, chose rather to be burnt at a stake than renounce the reformed religion and embrace the errors of popery—surely all these persons exhibited a virtue, a faith in God, and a steady adherence to what they believed to be the truth, far superior to what Adam displayed, when his wife gave him of the forbidden fruit, and he did eat." If it be said that these persons were supported under their trials by the grace of God strengthening them, the same will be said of Adam. He was undoubtedly supplied with every aid from the spirit of grace which was necessary to enable him to fulfil his duty; for being designed for more than mere animal life, even for the refined enjoyments of heaven, there is every reason to believe, as we have already observed, that he was put under the guidance of the Holy Ghost, to train him for that supernatural state of felicity. These communications of the spirit would of course be withdrawn when he forfeited his right to those privileges, on account of which they were originally vouchsafed to him; but that any positive malignity or taint was infused into his nature, that his mere rational powers were weakened, or his appetites inflamed by the forbidden fruit, there is no evidence to be found in scripture, or in the known constitution of things. The attributing of this supposed hereditary taint to the noxious qualities of the forbidden fruit, is a whimsical hypothesis, which receives no countenance from any well authenticated fact in natural history. After the numberless falsehoods that have been told of the poison tree of Java (see *Poison Tree*), something more would be requisite than the common evidence of a lying voyager to give credit to the qualities of the Indian tree, of which the fruit instantly turns

129
And deem
the physical
illustration
of it whimsical.

the wisest man into an idiot:—and yet for this singular story our ingenious author vouchsafes not even that evidence, slight as it generally is. The inference drawn from the covering used by our first parents is contradicted by every thing that we know of human nature; for surely no man, inflamed to the utmost by the fire of animal love, ever turned his eyes from a naked beauty ready and eager to receive him to her embrace. Yet this, it seems, was the behaviour of Adam and Eve in such a state! According to our author, the juice of the forbidden fruit had rendered their carnal appetites violent and independent of reason; according to the scripture, they were both naked; and as they were husband and wife, there was no law prohibiting them from gratifying these inflamed appetites. In such circumstances, how did they conduct themselves? One would naturally imagine that they immediately retired to some shady grove, and pleased themselves in all the soft dalliances of wedded love. Their conduct, however, was very different. We are told, that "they sewed fig-leaves together, and made themselves aprons to cover their nakedness;" And this transaction is brought as a proof of the impetuosity of their carnal appetites (R). The truth is, that the carnal appetite appears not to be naturally more violent than is necessary to answer the end for which it was implanted in the human constitution. Among savages the desires of animal love are generally very moderate; and even in society they have not often, unless inflamed by the luxurious arts of civil life, greater strength than is requisite to make mankind attend to the continuation of their species. In the decline of empires highly polished, where the difference of rank and opulence is great, and where every man is ambitious of emulating the expense of his immediate superiors, early marriages are prevented by the inability of most people to provide for a family in a way suitable to what each is pleased to consider as his proper station; and in that state of things the violence of animal love will indeed frequently produce great irregularities. But for that state of things, as it was not intended by the Author of nature, it is perhaps unreasonable to suppose that provision should be made; and yet we believe it will be found, upon due consideration, that if the desires of animal love were less violent than they are, the general consequences would be more pernicious to society than all the irregularities and vices which these desires now accidentally produce; for there would then be no intercourse between the sexes whatever except in the very highest stations of life. That our constitution is attended with many sensual appetites and passions, which, if suffered to grow excessive or irregular, become sinful, is true; and that there is great danger of their becoming excessive and irregular in a world so full of temptation as ours is, is also true; but there is no evidence that all this is the consequence of Adam's fall, and far less that it amounts to a *natural propensity* to sin. "For I presume (says Dr Taylor), that by a natural propensity is meant a necessary inclination to sin, or that we are necessarily sinful from the original bent and bias of our natural powers. But this must be false; for then we should not be

(R) We have never met with a satisfactory reason for the expedient of these fig-leave coverings. To us the following has sometimes occurred as an account of the matter, at least more plausible than that which has been assigned by Dr Delany. Persons under the agonies of remorse, or with the prospect of immediate death before them, have no relish for the pleasures of love; and as our first parents, upon eating the forbidden fruit, must have been in the one or other of these situations, they might think of sewing fig-leaves together, and making themselves aprons, as a mean of subduing an appetite, of which, at that instant, they must have abhorred the gratification. If they had any hope of a reprieve from death, and yet knew all the consequence of their sin, their most ardent wish would be to have no children; and not being acquainted as we are with the effects of dress, they would naturally imagine that their proposed coverings would diminish the force of the sexual appetite.

A. dit. ion. in. no. men. the. its. mi. ne. nd. by. tra.

D. b. ra. m. iam. d. Cen.

be sinful at all because that which is necessary, or which we cannot help, is not sin. That we are weak and liable to temptation, is the will of God holy and good, and for glorious purposes to ourselves; but if we are wicked, it must be through our own fault, and cannot proceed from any constraint, or necessity, or taint in our constitution."

Thus have we given as full and comprehensive a view as our limits will permit of the different opinions of the Calvinists and Arminians respecting the consequences of Adam's fall. If we have dwelt longer upon the scheme of the latter than of the former, it is because every Arminian argument is built upon criticism, and appeals to the original text; whilst the Calvinists rest their faith upon the plain words of scripture as read in our translation. If we might hazard our own opinion, we should say that the truth lies between them, and that it has been found by the moderate men of both parties, who, while they make use of different language, seem to us to have the same sentiments. That all mankind really sinned in Adam, and are on that account liable to most grievous torments in soul and body, without intermission, in hell fire for ever, is a doctrine which cannot be reconciled to our natural notions of God. On the other hand, if human nature was not somehow debased by the fall of our first parents, it is not easy to account for the numberless phrases in scripture which certainly seem to speak that language, or for the very general opinion of the Pagan philosophers and poets respecting the golden age and the degeneracy of man. Cicero, in a quotation preserved by St. Augustine from a work that is now lost, has these remarkable words, "Homo non ut a matre sed ut a noverca natura editus est in vitam corpore nudo, et fragili, et infirmo: animo autem anxio ad molestias, humili ad timores, molli ad labores, prono ad libidines; in quo tamen inest tanquam obrutus quidam divinus ignis ingenii et mentis †." Nor do we readily perceive what should induce the more zealous Arminians to oppose so vehemently this general opinion of the corruption of human nature. Their desire to vindicate the justice and goodness of God does them honour; but the doctrine of inherent corruption militates not against these attributes; for what we have lost in the first Adam has been amply supplied to us in the second; and we know from the highest authority that the duties required of us are in proportion to our ability, since we are told, that "unto whomsoever much is given, of him shall much be required."

SECT. IV. *View of Theology from the fall of Adam to the coming of Christ.*

WE have dwelt long on the original state of man, his introduction into the terrestrial paradise, the privileges to which he was there admitted, his forfeiture of those privileges, and the state to which he was reduced by transgressing the law of his Maker; but the importance of these events renders them worthy of all the attention that we have paid to them. They paved the way for the coming of Christ and the preaching of the gospel; and unless we thoroughly understand the origin of the gospel, we cannot have an adequate conception of its design. By contrasting the first with the second Adam, St. Paul gives us clearly to understand, that one purpose for which Christ came into the world and suffered death upon the cross, was to restore to mankind that life which they had lost by the fall of their original progenitor. The preaching of the gospel therefore commenced with the first hint of such a restoration; and the promise given to Adam and Eve, that "the seed of the woman should bruise the head of the serpent," was as truly evangelical as these words of the apostle, by which we are

taught, that "this is a faithful saying and worthy of all acceptance, that Christ Jesus came into the world to save sinners *." The former text taken by itself is indeed obscure, and the latter is explicit; but both belong to the same system, for the scriptures contain but two covenants or dispensations of God to man, in which the whole race is included.

Christianity therefore is indeed very near as old as the creation; but its principles were at first obscurely revealed, and afterwards gradually developed under different forms as mankind became able to receive them, (see PROPHECY, n. 5, &c.). All that appears to have been at first revealed to Adam and Eve was, that by some means or other one of their posterity should in time redeem the whole race from the curse of the fall; or if they had a distinct view of the means by which that redemption was to be wrought, it was probably communicated to them at the institution of sacrifices, (see SACRIFICE). This promise of a future deliverer served to comfort them under their heavy sentence; and the institution of sacrifices, whilst it impressed upon their minds lively ideas of the punishment due to their transgression, was admirably calculated to prepare both them and their posterity for the great atonement which, in due time, was to take away the sins of the world.

Our first parents, after their fall, were so far from being left to fabricate a mode of worship for themselves by those innate powers of the human mind of which we daily hear so much and feel so little, that God was graciously pleased to manifest himself to their senses, and visibly to conduct them by the angel of his presence in all the rites and duties of religion. This is evident from the different discourses which he held with Cain, as well as from the complaint of that murderer of being hid from his face, and from its being said, that "he went out from the presence of the Lord and dwelt on the east of Eden." Nor does it appear that God wholly withdrew his visible presence, and left mankind to their own inventions, till their wickedness became so very great that his spirit could no longer strive with them. The infant state of the world stood in constant need of his supernatural guidance and protection. The early inhabitants of this globe cannot be supposed to have been able, with Moses *, to look up to him who is invisible, and perform a worship purely rational and spiritual. They were all tillers of the ground, or keepers of cattle; employed in cultivating and replenishing this new world; and, through the curse brought upon it by their forefather, forced, with him, to eat their bread "in the sweat of their brow." Man in such circumstances could have little leisure for speculation; nor has mere speculation, unless furnished with principles from another source, ever generated in the human mind adequate notions of God's nature or providence, or of the means by which he can be acceptably worshipped. Frequent manifestations, therefore, of his presence would be necessary to keep up a tolerable sense of religion among them, and secure obedience to the divine institutions; and that the Almighty did not exhibit such manifestations, cannot be inferred from the silence of that very short history which we have of those early ages. Adam himself continued 930 years a living monument of the justice and mercy of God; of his extreme hatred and abhorrence of sin, as well as of his love and long-suffering towards the sinner. He was very sensible how sin had entered into the world, and he could not but apprise his children of its author. He would at the same time inform them of the unity of God, and his dominion over the evil one; of the means by which he had appointed himself to be worshipped; and of his promise of future deliverance from the curse of the fall. Such information would produce a tolerable idea of the Divine Being,

ing, and afford sufficient motives to obey his will. The effects of it accordingly were apparent in the righteous family of Seth, who soon distinguished themselves from the posterity of Cain, and for their eminent piety were honoured with the appellation of *the sons of God*. Of this family sprang a person so remarkable for virtue and devotion, as to be exempted from Adam's sentence and the common lot of his sons; for after he had walked with God 300 years, and prophesied to his brethren, he was translated that he should not see death. Of this miraculous event there can be no doubt but that his contemporaries had some visible demonstration; and as the fate of Abel was an argument to their reason, so the translation of Enoch was a proof to their senses of another state of life after the present. To Adam himself, if he was then alive (s), it must have been a lively and affecting instance of what he might have enjoyed, had he kept his innocence; it must have been a comfortable earnest of the promised victory over the evil one; and have confirmed his hope, that when the head of the serpent should be completely bruised, he and his posterity would be restored to the favour of their Maker, and behold his presence in blest and immortality.

134. Vice, and probably idolatry, soon became prevalent.

Notwithstanding this watchful care of God over his fallen creature man, vice, and probably idolatry, spread through the world with a rapid pace. The family of Seth married into that of Cain, and adopted the manners of their new relations. Rapine and violence, unbounded lust and impurity of every kind, prevailed universally; and when those giants in wickedness had filled the earth with tyranny, injustice, and oppression; when the whole race was become entirely carnal—God, after raising up another prophet to give them frequent warnings of their fate for the space of 120 years, was at length obliged, in mercy to themselves as well as to the succeeding generations of men, to cut them off by a general deluge. See DELUGE.

135. Pure religion for some time after the flood;

Thus did God, by the spirit of prophecy, which is by some supposed to have been hereditary in the heads of families; by frequent manifestations of his own presence; and by uninterrupted tradition—make ample provision for the instruction and improvement of the world for the first 1600 years. After the deluge he was pleased to converse again with Noah, and make in his person a new and extensive covenant with mankind, (see PROPHECY, n^o 11.). Of his power, justice, and goodness; of his supreme dominion over the earth and the heavens; of his abhorrence of sin, and his determination not to let it go unpunished—that patriarch and his family had been most awfully convinced; nor could they or their children, for some time, want any other argument to enforce obedience, fear, and worship. The sons of Noah were an 100 years old when the deluge overwhelmed the earth. They had long conversed with their ancestors of the old world, had frequented the religious assemblies, observed every Sabbath day, and been instructed by those who had seen Adam. It is therefore impossible that they could be ignorant of the creation of the world, of the fall of man, or of the promise of future deliverance from the consequences of that fall; or that they could offer their sacrifices, and perform the other rites of the instituted worship, without looking forward with the eye of faith to that deliverance seen, perhaps obscurely, through their typical oblations.

In this state of things, with the awful remembrance of the deluge continually present to their minds, religion might

for some time be safely propagated by tradition. But when by degrees mankind corrupted that tradition in its most essential parts; when, instead of the one Supreme God, they set up several orders of inferior deities, and worshipped all the host of heaven; when, at the same time they were uniting under one head, and forming a universal empire under the patronage of the Sun their chief divinity (see BABEL)—God saw it necessary to disperse them into distinct colonies, by causing such discord among them as rendered it impossible for any one species of idolatry to be at once universally established.

After this dispersion, there is reason to believe that particular revelations were vouchsafed wherever men were disposed to regard them. Peleg had his name prophetically given him from the dispersion which was to happen in his days; and not only his father Eber, but all the heads of families mentioned from Noah to Abraham, are with much plausibility supposed to have had the spirit of prophecy on many occasions. Noah was undoubtedly both priest and prophet; and living till within two years of the birth of Abraham, or, according to others, till that patriarch was near 60 years old, he would surely be able to keep up a tolerable sense of true religion among such of his descendants as sojourned within the influence of his doctrine and example. His religious son Shem, who lived till after the birth of Isaac, could not but preserve in tolerable purity the faith and worship of the true God among such of his own descendants as lived in his neighbourhood.

But though the remains of true religion were thus preserved among a few righteous men, idolatry, with its inseparable attendants, unnatural lusts and cruel superstition (τ), had in a short time prevailed so far among the sons of Noah, that God, in his infinite wisdom, saw it expedient not only to shorten the lives of men, but also to withdraw his presence from the generality, who had thus rendered themselves unworthy of such communications; and to select a particular family, in which his worship might be preserved pure amidst the various corruptions that were overspreading the world. With this view Abraham was called; and after many remarkable trials of his faith and constancy, admitted to a particular intimacy and friendship with his Maker. God entered into a peculiar covenant with him, engaging to be his present guide, protector, and defender; to bestow all temporal blessings upon him and his seed; and to make some of those seed the instruments of conveying blessings of a higher kind to all the nations of the earth.

It was doubtless for his singular piety that Abraham was fixed upon to be the parent of that people, who should preserve the knowledge of the unity of God in the midst of an idolatrous and polytheistic world; but we are not to imagine that it was for his sake only that all this was done, or that his less worthy descendants were by the equal Lord of all treated with partial fondness for the virtues of their ancestor; it was for the benefit of mankind in general that he was called from his country, and from his father's house, that he might preserve the doctrine of the Divine unity in his own family, and be an instrument in the hand of Providence (and a fit one he was) to convey the same faith to the nations around him. Accordingly, we find him distinguished among the neighbouring princes, and kings reproved for his sake; who being made acquainted with his prophetic character, desire his intercession with God. History tells us of his conversing on the subject of religion with the most learn-

(s) According to the Samaritan chronology, he was alive; according to the Hebrew, he had been dead 57 years.

ed Egyptians, who appear to have derived from him or some of his descendants the rite of circumcision, and to have been for a while stopt in their progress towards the last stage of that degrading idolatry which afterwards rendered their national worship the opprobrium of the whole earth, (see POLYTHEISM, n^o 28). We are informed that his name was had in the greatest veneration all over the East; that the Magians, Sabians, Persians, and Indians, all glory in him as the great reformer of their respective religions: and to us it appears extremely probable, that not only the Brachmans, but likewise the Hindoo god Brahma*, derive their names from the father of the faithful. As he was let into the various counsels of the Almighty, and taught to reason and reflect upon them; as he was fully apprised of the overthrow of Sodom and Gomorrah, with the particular circumstances of that miraculous event; and as he had frequent revelations of the promised Redeemer, whose day he longed earnestly to see, and seeing it was glad—there can be no doubt but that he and his family took care to propagate these important doctrines in every nation which they visited; for the only reason which we can conceive for his being made to wander from place to place was, that different people might be induced to inquire after his profession, his religion, and his hopes.

All this was indeed little enough to keep alive even in the mind of Jacob a tolerable sense of duty and dependence on his Creator. After the first vision he is surprised, and hesitates, seeming inclined to make a kind of stipulation with his Maker. "If (says he) God will be with me, and will keep me in this way that I go, and will give me bread to eat, and raiment to put on, so that I come again to my father's house in peace, then shall the Lord be my God &c." It appears not to have been till after many such revelations, blessings, and deliverances, and being reminded of the vow which on this occasion he had vowed, that he set himself in good earnest to reform the religion of his own family, and to drive out from it all strange gods*. So little able, in that age, were the boasted powers of the human mind to preserve in the world just notions of the unity of the Godhead, that we see there was a necessity for very frequent revelations, to prevent even the best men from running headlong into polytheism and idolatry.

Thus was God obliged to treat even with the patriarchs themselves, by way of positive covenant and express compact; to promise to be their God if they would be his people; to give them a portion of temporal blessings as introductory to future and spiritual ones; and to engage them in his service by immediate rewards, till they could be led on to higher views, and prepared by the bringing in of a better hope to worship him in spirit and in truth. With regard to what may be called the theory of religion, mankind were yet scarcely got out of their childhood. Some extraordinary persons indeed occasionally appeared in different countries, such as Enoch, Noah, Abraham, and Job, with many others, who had a more enlarged prospect of things, and entertained more worthy sentiments of the divine dispensations and of the ultimate end of man; but these were far superior to the times in which they lived, and appear to have been providentially raised up to prevent the savage state and savage idolatry from becoming universal among men. See SAVAGE.

The worship which was practised by those holy men appears to have consisted principally of the three kinds of sacrifice mentioned elsewhere (see SACRIFICE); to which were doubtless added prayers and praises, with the more valuable oblation of pure hands and devout hearts. Such of them as looked forward to a future redemption, and had any tolerable notion of the means by which it was to be effected, as Abraham certainly had, must have been sensible that the blood of bulls and of goats could never take away sin, and that their sacrifices were therefore valuable only when they were offered in faith of that great promise, "which they,

(u) There are great disputes among the learned respecting the antiquity and the author of the book of Job, and whether it be a history of events, or a poem which has its foundation in history. All sober men, however, are agreed, that there really was such a person as Job, eminent for patience under uncommon sufferings; and that he was of very remote antiquity. The LXX. give us the names of his father and mother, and say that he was the fifth from Abraham.

460

Theology from the fall of Adam to the coming of Christ.

having seen it afar off, were persuaded of, and embraced; and confessed that they were strangers and pilgrims upon earth."

That such persons looked for "a better country, even a heavenly one," in a future state, cannot be questioned; for they knew well how sin and death had entered into the world, and they must have understood the promise made to their original progenitor, and repeatedly renewed to themselves, to include in it a deliverance at some period from every consequence of the first transgression. They were to all intents and purposes Christians as well as we. They indeed placed their confidence in a Redeemer, who in the fulness of time was to appear upon earth, while we place ours in a Redeemer that has been already manifested; they expressed that confidence by one mode of worship, we express it by another; but the patriarchal worship had the same end in view with the Christian—the attainment of everlasting life in heaven.

142 Of a future Redeemer;

143 Such faith, however, not general.

The generality of men, however, appear not, in the early age of which we now write, to have extended their views beyond the present life. From the confused remains of ancient tradition, they acknowledged indeed some superior power or powers, to whom they frequently applied for direction in their affairs; but in all probability it was only for direction in temporal affairs, such as the cultivation of the ground, or their transactions with each other. In the then state of things, when no part of the world was overstocked with inhabitants, and when luxury with its consequences were everywhere unknown, virtue and vice must have produced their natural effects; and the good man being happy here, and the wicked man miserable, reason had no data from which to infer the reality of a future state of rewards and punishments. Those who were blessed with the light of revelation undoubtedly looked forward to that state with a holy joy; but the rest worshipped superior powers from worldly motives. How many of those powers there might be, or how far their influence might reach, they knew not. Uncertain whether there be one Supreme Governor of the whole world, or many co-ordinate powers presiding each over a particular country, climate, or place—gods of the hills and of the valleys, as they were afterwards distinguished—they thought that the more of these they could engage in their interest the better. Like the Samaritans therefore, in after times, they sought, wherever they came, the "manners of the god of the land," and served him, together with their own gods.

144 The purpose for which the Israelites were made to sojourn in Egypt.

Thus was the world ready to lose all knowledge of the true God and his worship, had not he been graciously pleased to interpose, and take effectual care to preserve that knowledge in one nation, from which it might be conveyed to the rest of mankind at different times, and in greater or less degrees, as they should be capable of receiving it. To this purpose he made way for the removal of Jacob and his family to one of the most improved and polished countries of the world; and introduced them into it in a manner so advantageous, as to give them an opportunity of imparting much religious knowledge to the natives. The natives, however, were gross idolaters; and that his chosen people might be as far as possible from the contagion of their example, he placed them upon the borders of Egypt, where, though they multiplied exceedingly, they were by their very occupation † still kept a separate people, and must have been rendered, by a long and severe oppression, in a great degree averse from the manners and religion of their neighbours. This aversion, however, seems to have gradually become less and less; and before they were miraculously redeemed from their house of bondage, they had certainly lost all correct notions of the unity of God, and the nature of his worship,

† Gen. xlvi. 33: 34.

and had adopted the greater part of the superstitious of their task-masters. Of this we need no other proof than what is implied in the words of Moses*, when he laid unto God, "Behold, when I come unto the children of Israel, and say unto them, the God of your fathers hath sent me unto you; and they shall say unto me, WHAT IS HIS NAME? what shall I say unto them?" Had not the destined lawgiver of the Hebrews been aware that his countrymen had adopted a plurality of gods, this difficulty could not have occurred to him; for names are never thought of but to distinguish from each other beings of the same kind; and he must have remembered, that in Egypt, where the multitude of gods was marshalled into various classes, the knowledge of their names was deemed of great importance. This we learn likewise from Herodotus, who informs us*, that the Pelasgi, after settling in Greece, thought it necessary to consult the oracle of Dodona, whether it would be proper to give to their own gods the names of the Egyptian divinities? and that the oracle, as might have been supposed, assured them that it would. Indeed the Hebrews during their residence in Egypt had acquired such an attachment to the idolatrous worship of the country, that it appears never to have left them entirely till many ages afterwards, when they were carried captive into Babylon, and severely punished for their repeated apostacies; and so completely were they infatuated by these superstitious at the era of their exodus, that, as the prophet Ezekiel informs us*, they rebelled against God, and would not cast away their abominations, or forsake the idols of Egypt, even in the very day that the hand of Omnipotence was lifted up to bring them forth of that land in which they had been so long and so cruelly oppressed. In such a state of things, to have suffered them to remain longer in Egypt, could have served no good purpose; and therefore to fulfil the promise which he had given to Abraham, God determined to deliver them out of the hand of the Egyptians by means which should convince both them and their offspring of his own supremacy over heaven and earth.

As Moses was the person appointed to deliver God's message to Pharaoh, and to demand of him leave for the Israelites to go three days journey into the wilderness to serve the God of their fathers, it was necessary that he should be endowed with the power of making miracles to evince the reality of his divine mission. Without a conviction that his claims were well-founded, neither Pharaoh nor his own countrymen could reasonably have been expected to listen to the proposals of a man who, though blessed in his youth with a princely education, had come directly on his embassy from the humble employment of a shepherd, which he had for many years exercised in the country of Midian. To prove that he was really sent by God, any visible and undoubted controul of the laws of nature would have been abundantly sufficient; but he was to prove not only this truth, but also the unity of the Divine nature; and the miracles which he was directed to work were executions of judgments against the very gods of Egypt*.

When Pharaoh first turned a deaf ear to his request, tho' enforced by the conversion of a rod into a serpent, at the command of Jehovah he smote with the same rod upon the waters in the river, which were instantly converted into blood, and occasioned the death of all the fishes that swam in them. To any people this miracle would have been a proof of Divine agency; but it was in a particular manner calculated to open the eyes of the blind and infatuated Egyptians, who considered the Nile as one of their greatest gods, and all the fishes that it contained as subordinate divinities. They called that noble river sometimes *Siris*, sometimes *Osiris*, sometimes *Canobus* (see *CANOBUS*), and

146 Moses pointed out of Egypt.

* Exod. 12.

147 The price of the mirror which wrought

not un frequently *θεογονία* (x); and adored it as the parent of all their deities. What then must the people have thought when they found their most revered god, at the command of a servant of Jehovah, converted into blood, and all his sacred offspring into stinking carcases? To conceive their consternation, if it can be conceived, the reader must remember, that the Egyptian priests held blood in the utmost abhorrence, as a thing of which the very touch would deeply pollute them, and require immediate and solemn expiation. The same sacred river was a second time polluted, when it sent forth frogs, which covered all the land of Egypt, and died in the houses, in the villages, and in the fields; thus rendering it impossible for the people to avoid the touch of dead bodies, though from every such contact they believed themselves to contract an impurity, which, in the case before us, must have been the more grievous, that in the whole country there was not left a pool of uninfected water to wash away the stain.

The third plague inflicted upon the Egyptians was, the converting of the dust of the land into lice, upon man and upon beast, throughout the whole kingdom. To see the propriety of this miracle as a judgment upon their idolatry, we must recollect their utter abhorrence of all kinds of vermin, and their extreme attention to external purity above every other people perhaps that has hitherto existed on the face of the earth. Upon this head they were more particularly solicitous when about to enter the temples of their gods; for Herodotus informs us, that their priests wore linen raiment only, and shaved off every hair from their heads and bodies, that there might be no *louse* or other detestable object upon them when performing their duty to the gods. This plague therefore, while it lasted, made it impossible for them to perform their idolatrous worship, without giving such offence to their deities as they imagined could never be forgiven. Hence we find, that on the production of the lice, the priests and magicians perceived immediately from what hand the miracle had come, and exclaimed, "This is the finger of God!" The fourth plague seems to have been likewise acknowledged to be the finger of God, if not by the magicians, at least by Pharaoh; for in a fit of terror he agreed that the Israelites should go and serve the Lord. That he was terrified at the swarms of flies which infested the whole country, except the land of Goshen, will excite no wonder, when it is known that the worship of the fly originated in Egypt; whence it was carried by the Captivity to Palestine; by the Phœnicians to Sidon, Tyre, and Babylon; and from these regions to other parts of the world. The denunciation of this plague was delivered to Pharaoh early in the morning, when he was on the banks of the Nile, probably paying his accustomed devotion to his greatest god; and when he found himself and his people tormented by a swarm of subordinate divinities, who executed the judgment of Jehovah in defiance of the power of the supreme *numen* of Egypt, he must have been convinced, had any candour remained in his mind, that the whole system of his superstition was a mass of absurdities, and that his gods were only humble instruments at the disposal of a Superior Power. He was not, however, convinced; he was only alarmed, and quickly relapsed into his wonted obstinacy. The fifth plague therefore, the murrain among the cattle, brought death and destruction upon his most revered gods themselves. Neither Osiris, nor Isis, nor Ammon, nor Pan, had power to save his brute representatives. The sacred bull, and heifer, and ram, and goat, were

carried off by the same malady which swept away all the other herds of deities, these *dii stercorei*, who lived on grass and hay. The impresson of this punishment must have been awful upon the minds of the Egyptians, but perhaps not equal to that which succeeded it.

In Egypt there were several altars on which human sacrifices were offered; and from the description of the persons qualified to be victims, it appears that those unhappy beings must have been foreigners, as they were required to have bright hair and a particular complexion. The hair of the Israelites was much brighter than that of the Egyptians, and their complexions fairer; and therefore there can be little doubt but that, during their residence in Egypt, they were made to furnish the victims demanded by the bloody gods. These victims being burnt alive on a high altar, and thus sacrificed for the good of the nation, their ashes were gathered together by the priests, and scattered upwards in the air, that a blessing might be entailed on every place to which an atom of this dust should be wafted. Moses too, by the direction of the true God, took ashes of the furnace, probably of one of those very furnaces in which some of his countrymen had been burnt, and sprinkling them towards heaven in the sight of Pharaoh, brought boils and blains upon all the people, of so malignant a nature, that the magicians and the other ministers of the medical gods, with which Egypt abounded beyond all other countries, could not themselves escape the infection.

The powers of darkness were thus foiled; but the heart of the monarch was still hardened. Destruction was therefore next brought upon him and his country by the elements, which were among the earliest idol deities not only of the Egyptians, but of every other polytheistic nation. "The Lord rained hail upon the land of Egypt; so that there was hail, and fire mingled with the hail, such as there was none like it in all the land of Egypt since it became a nation. And the hail smote throughout all the land of Egypt all that was in the field, both man and beast; and the hail smote every herb of the field, and broke every tree of the field." This was a dreadful calamity in itself; and the horror which it excited in the minds of the people must have been greatly aggravated by the well-known fact, that Egypt is blessed with a sky uncommonly serene; that in the greatest part of it rain has never been seen at any other time since the creation of the world; and that a slight and transient shower is the utmost that in the ordinary course of nature falls anywhere throughout the country. The small quantity of vegetables which was left undestroyed by the fire and the hail was afterwards devoured by locusts, which by a strong east wind were brought in such numbers from Arabia, where they abound at all times, that they covered the whole face of the earth, and did eat every herb of the land, and all the fruit of the trees, so that there remained not any green thing in the trees or in the herbs of the field through all the land of Egypt.

The ninth plague which the obstinacy of Pharaoh brought upon his country, whilst it severely punished the Egyptians for their cruelty to the Hebrews, struck at the very foundation of all idolatry. We have elsewhere shown, that the first objects of idolatrous worship were the contending powers of light and darkness (see *POLYTHEISM*); and that the benevolent principle, or the power of light, was everywhere believed to maintain a constant superiority over the power of darkness. Such was the faith of the ancient Persians; and such, as a very learned writer has lately proved, was like-

The glory
from the
fall of A-
dam to the
coming of
Christ.

wife the faith of the earlier Egyptians. It was therefore with wisdom truly divine, that God, to show the vanity of their imaginations, brought upon those votaries of light, who fancied themselves the offspring of the sun, a preternatural darkness, which, for three days, all the powers of their supreme deity and his subordinate agents could not dispel.

The tenth and last plague brought upon this idolatrous people was more universally and severely felt than any which had preceded it. It was likewise, in some sense, an instance of the *lex talionis*, which requires an eye for an eye, and a tooth for a tooth, &c. Moses was commanded, at his first interview with Pharaoh, to say, "Thus saith the Lord, Israel is my son, even my first-born. Let my son go that he may serve me: and if thou refuse to let him go, behold, I will slay thy son, even thy first-born." Before this threat was put in execution, every attempt was made to soften the hardened heart of the obdurate tyrant. The waters of his sacred river were turned into blood, and all the fishes that it contained slain; frogs were brought over all the land to pollute the people; the ministers of religion were rendered so impure by vermin, that they could not discharge their wonted offices; the animals most revered as gods, or emblems of gods, were cut off by a murrain; the elements, that were everywhere worshipped as divinities, carried through the land a devastation, which was completed by swarms of locusts; the ashes from the sacred furnace, which were thought to convey blessings whithersoever they were wafted, were made to communicate incurable diseases; a thick and preternatural darkness was spread over the kingdom, in defiance of the power of the great Osiris; and when the hearts of the people and their sovereign continued still obdurate, the eldest son in each family was slain, because they refused to let go Israel, God's first-born. From this universal pestilence the Israelites were preserved by sprinkling the doorposts of their houses with the blood of one of the animals adored in Egypt; a fact which, as it could not be unknown to Pharaoh or his subjects, ought to have convinced that people of the extreme absurdity of their impious superstitions. This effect it seems not to have had; but the death of the first-born produced the deliverance of the Hebrews; for when it was found that there was not a house where there was not one dead, "Pharaoh called for Moses and Aaron by night, and said, Rise up, and get you forth from among my people, both you and the children of Israel; and bless me also. And the Egyptians were urgent upon the people, that they might send them out of the land in haste; for they said, We be all dead men (v)." The wonted obliquity of the monarch indeed very soon returned; and his subjects, forgetting the loss of their children, joined with him in a vain attempt to bring back to bondage the very people whom they had been thus urgent to send out of the land; but their attempt was defeated by Jehovah, and all who engaged in it drowned in the Red Sea.

The God of Israel having thus magnified himself over the Egyptians and their gods, and rescued his people from bondage by such means as must not only have struck terror and astonishment into the whole land, but also have spread his name through all the countries which had any communica-

tion with that far-famed nation, proceeded to instruct and exercise the Hebrews for many years in the wilderness. He inculcated upon them the unity of the Godhead; gave them statutes and judgments more righteous than those of any other nation; and by every method consistent with the freedom of moral agency guarded them against the contagion of idolatry and polytheism. He sent his angel before them to keep them in the way, took upon himself the office of their supreme civil governor, and by his presence directed them in all their undertakings. He led them with repeated signs and wonders through the neighbouring nations, continued to try and discipline them till they were tolerably attached to his government and established in his worship, and introduced them into the Promised Land when its inhabitants were ripe for destruction. At their entrance into it, he gave them a summary repetition of their former laws, with more such ordinances, both of a ceremonial and moral kind, as were both suited to their temper and circumstances, as well as to prefigure, and by degrees to prepare them for, a more perfect dispensation under the Messiah.

The Jewish law had two great objects in view; of which the first was to preserve among them the knowledge of the true God, a rational worship springing from that knowledge, and the regular practice of moral virtue; and the second was to fit them for receiving the accomplishment of the great promise made to their ancestors, by means analogous to those which a schoolmaster employs to fit his pupils for discharging the duties of maturer years. Every thing in that law peculiar to itself, its various ceremonies, modes of sacrificing, the sanctions by which it was enforced, and the theocratic government by which it was administered, had a direct tendency to promote one or other of these ends; and keeping these ends in view, even the minutest laws, at which impious ignorance has affected to make itself merry, will be discovered by those who shall study the whole system, and are at the same time acquainted with the genius of ancient polytheism, to have been enacted with the most consummate wisdom.

It is not easy for us, who have been long blessed with the light of revelation, and who have cultivated our minds by the study of the sciences, to conceive the propensity of all nations, in that early age of the world, to the worship of false gods, of which they were daily adding to the number. It is indeed probable, from many passages of Scripture, as well as from profane authors of the greatest antiquity, that one supreme *numen* was everywhere acknowledged; but he was considered as an extramundane being, too highly exalted to concern himself with the affairs of this world, the government of which, it was believed, he had delegated to various orders of subordinate deities. Of those deities, some were supposed to have the charge of one nation and some of another. Hence it is, that we read of the gods of Egypt, the gods of the Amorites, and the gods of the different nations round about Palestine. None of those nations denied the existence of their neighbour's gods; but all agreed, that while the Egyptians were the peculiar care of Osiris and Isis, the Amorites might be the favourites of Moloch, the Phœnicians of Cronus, and the Philistines of Dagon; and they

(v) For this account of the plagues of Egypt, we are indebted to the very valuable *Observations* on the subject lately published by *Mr Bryant*. We have not quoted the authorities by which the learned and pious author supports his opinions; because it is to be hoped, that for a fuller account of these important transactions the reader will have recourse to his work, of which we have given only a very brief abstract. For much of the preceding parts of this section, we acknowledge our obligations to the late Bishop Law's admirable discourse on the *Several Dispensations of Revealed Religion*.

they had no objection occasionally to join with each other in the worship of their respective tutelary deities. Nay, it was thought impious in foreigners, while they sojourned in a strange country, not to sacrifice to the gods of the place. Thus Sophocles makes Antigone say to her father, that a stranger should both venerate and abhor those things which are venerated and abhorred in the city where he resides; and another author *, who, though comparatively late, drew much of his information from ancient writings, which are now lost, assures us, that this complaisance proceeded from the belief that the "several parts of the world were from the beginning distributed to several powers, of which each had his peculiar allotment and residence."

From this notion of local divinities, whose power or partial fondness was confined to one people, the Israelites, at their exodus from Egypt, appear not to have been free (z). Hence it is, that when the true God first tells them, by their leader Moses *, that if they would obey his voice indeed and keep his covenant, then they should be a PECULIAR TREASURE to him above all people: to prevent them from supposing that he shared the earth with the idols of the heathen, and had from partial fondness chosen them for his portion, he immediately adds, FOR ALL THE EARTH IS MINE. By this addition he gave them plainly to understand that they were chosen to be his peculiar treasure for some purpose of general importance; and the very first article of the covenant which they were to keep was, that they should have no other gods but him. So inveterate, however, was the principle which led to an intercommunity of the objects of worship, that they could not have kept this article of the covenant but in a state of separation from the rest of mankind †; and that separation could neither have been effected nor continued without the visible providence of the Almighty watching over them as his peculiar treasure. This we learn from Moses himself, who, when interceding for the people after their idolatrous worship of the golden calf, and intreating that the presence of God would still accompany them, adds these words †: "For wherein shall it be known here that I and thy people have found grace in thy sight? Is it not in that THOU GOEST WITH US? So shall we be SEPARATED, I and thy people, from all the people that are upon the face of the earth." Upon this separation every thing depended: and therefore to render it the more secure, Jehovah, who in compliance with their prejudices had already assumed the appellation of their tutelary God, was graciously pleased to become likewise their supreme Magistrate, making them a "kingdom of priests and a holy nation," and delivering to them a digest as well of their civil as of their religious laws.

The Almighty thus becoming their King, the government of the Israelites was properly a THEOCRACY, in which the two societies, civil and religious, were of course incorporated. They had indeed after their settlement in the Promised Land, at first, temporary judges occasionally raised up; and afterwards permanent magistrates called kings, to

lead their armies in war, and to give vigour to the administration of justice in peace: but neither those judges nor those kings could abrogate a single law of the original code, or make the smallest addition to it but by the spirit of prophecy. They cannot therefore be considered as supreme magistrates, by whatever title they may have been known; for they were to go out and come in at the word of the priests, who were to ask counsel for them of the Lord, and with whom they were even associated in all judicial proceedings, as well of a civil as of a spiritual nature *. Under any other than a theocratic government the Hebrews could not have been kept separate from the nations around them; or if they could, that separation would not have answered the great purpose for which it was established. "The people, on their leaving Egypt, were sunk into the lowest practices of idolatry. To recover them by the discipline of a separation, it was necessary that the idea of God and his attributes should be impressed upon them in the most sensible manner. But this could not be commodiously done under his character of God of the universe: under his character of King of Israel, it well might. Hence it is, that we find him in the Old Testament so frequently represented with affections analogous to human passions. The civil relation in which he stood to the Israelites made such a representation natural; the grossness of their conceptions made the representation necessary; and the guarded manner in which it was always qualified prevented it from being mischievous." † Hence too it is, that under the Mosaic dispensation, idolatry was a crime of state, punishable by the civil magistrate. It was indeed high treason, against which laws were enacted upon the justest principles, and carried into effect without danger of error. Nothing less indeed than penal laws of the severest kind could have restrained the violent propensity of that headstrong people to worship, together with their own God, the gods of the Heathen. But penal laws enacted by human authority for errors in religion are manifestly unjust; and therefore a theocratic government seems to have been absolutely necessary to obtain the end for which the Israelites were separated from the surrounding nations.

It was for the same purpose of guarding them against idolatry, and preventing all undue communications with their Heathen neighbours, that the ritual law was given, after their presumptuous rebellions in the wilderness. Before the business of the golden calf, and their frequent attempts to return into Egypt, it seems not to have been the Divine intention to lay upon them a yoke of ordinances; but to make his covenant depend entirely upon their duty practising the rite of circumcision; observing the festivals instituted in commemoration of their deliverance from bondage, and other signal services vouchsafed them; and keeping inviolate all the precepts of the decalogue (A), which, if they had done, they should have even lived in them *. But after their repeated apostacies, and impious wishes to mix with the surrounding nations, it was necessary to subject them

Theology from the Fall of Adam to the coming of Christ.

153 And of the ritual law.

* Dicine sec. 6.

(z) It is not indeed evident that they had got entirely quit of this absurd opinion at a much later period. Jephtha, one of their judges, who, though half paganized (as Warburton observes) by a bad education, had probably as correct notions of religion as an ordinary Israelite, certainly talked to the king of Ammon as if he had believed the different nations of the earth to be under the immediate protection of different deities: "Wilt not thou (says he) possess that which Chemosh thy God riveth thee to possess? So whomsoever the Lord our God shall drive out from before us, them will we possess. (Judges xi. 24).

(A) Of these precepts we think it not necessary, in an abstract so short as this, to waste the reader's time with a formal and laboured defence. To the decalogue no objection can be made by any man who admits the obligations of natural religion; for, except the observation of the Sabbath-day, it enjoins not a single duty which does not by the confession of all men result from our relations to God, ourselves, and our fellow-creatures.

them to a multifarious ritual, of which the ceremonial parts were solemn and splendid, fitted to engage and fix the attention of a people whose hearts were gross; to inspire them with awful reverence, and to withdraw their affections from the pomp and pageantry of those idle superstitions which they had so long witnessed in the land of Egypt. To keep them warmly attached to their public worship, that worship was loaded with operose and magnificent rites, and so completely incorporated with their civil polity as to make the same things at once duties of religion and acts of state. The service of God was indeed so ordered as to be the constant business as well as entertainment of their lives, supplying the place of all other entertainments; and the sacrifices which they were commanded to offer on the most solemn occasions, were of such animals as the Egyptians and other Heathens deemed sacred.

154
Influenced
in their
sacrifices.

Thus a heifer without blemish was in Egypt held sacred to the goddess Isis, and actually worshipped as the representative of that divinity; but the same kind of heifer was by the ritual law of the Hebrews commanded to be burnt without the camp, as the vilest animal, and the water of separation to be prepared from her ashes †. The goat was by the Egyptians held in great veneration as emblematical of their ancient god Pan, and sacrifices of the most abominable kind were offered to the impure animal (see PAN); but God, by his servant Moses, enjoined the Israelites to offer goats themselves as sacrifices for sin, and on one occasion to sacrifice the live animal loaded with maledictions into the wilderness *. The Egyptians, with singular zeal, worshipped a calf without blemish as the symbol of Apis, or the god of fertility; and it appears from the book of Exodus, that the Israelites themselves had been infected with that superstition. They were, however, so far from being permitted by their Divine lawgiver to consider that animal as in any respect sacred, that their priests were commanded to offer for themselves a young calf as a sin offering †. No animal was in Egypt held in greater veneration than the ram, the symbol of their god Ammon, one of the heavenly constellations. It was therefore with wisdom truly divine, that Jehovah, at the institution of the passover, ordered his people to kill and eat a young ram on the very day that the Egyptians began their annual solemnities § in honour of that animal as one of their greatest gods; and that he enjoined the blood of this divinity to be sprinkled as a sign upon the two side-posts and upper door-post of the house in which he was eaten. Surely it is not in the power of imagination to conceive a ritual better calculated to cure the Israelites of their propensity to idol worship, or to keep them separate from the people who had first given them that propensity, than one which enjoined them to offer in sacrifice the very creatures which their superstitious masters had worshipped as gods. "Shall we (said Moses) sacrifice the abominations of the Egyptians before their eyes, and will they not stone us?"

But it was not against Egyptian idolatry only that the ritual law was framed: the nations of Syria, in the midst of whom the Israelites were to dwell, were addicted to many cruel and absurd superstitions, against which it was as necessary to guard the people of God as against the bruteworship of Egypt. We need not inform any reader of the books of Moses that these nations worshipped the sun and moon and all the host of heaven; or that it was part of their religion to propitiate their offended gods by occasionally sacrificing their sons and their daughters. From such worship and such sacrifices the Israelites were prohibited under the severest penalties; but we cannot consider that prohibition as making part of the ritual law, since it relates to practices impious and immoral in themselves, and therefore de-

clared to be abominations to the Lord. The Phœnicians, however, and the Canaanites, entertained an opinion that every child came into the world with a polluted nature, and that this pollution could be removed only by a *lystral fire*. Hence they took their new-born infants, and with particular ceremonies made them pass through the flame of a pile sacred to Baal or Moloch, the symbols of their great god the sun. Sometimes this purgation was delayed till the children had arrived at their tenth or twelfth year, when they were made either to leap through the flame, or run several times backwards and forwards between two contiguous sacred fires; and this lustration was supposed to free them from every natural pollution, and to make them through life the peculiar care of the deity in whose honour it was performed *. The true God, however, who would have no fellowship with idols, forbade all such purgations among his people, whether done by fires consecrated to himself or to the bloody deities of the Syrian nations. "There shall not be found (says he) among you any one that maketh his son or his daughter to pass through the fire †."

There are, in the Jewish law, few precepts more frequently repeated than that which prohibits the seething of a kid in its mother's milk †; and there being no moral fitness in this precept when considered absolutely and without regard to the circumstances under which it was given, infidel ignorance has frequently thought fit to make it the subject of profane ridicule. But the ridicule will be borne by those who know that, among the nations round Judea, the feasting upon a kid boiled in its mother's milk was an essential part of the impious and magical ceremonies celebrated in honour of one of their gods, who was supposed to have been suckled by a she-goat. Hence, in the Samaritan Pentateuch, the text runs thus; "Thou shalt not seeth a kid in its mother's milk; for whoever does so, is as one who sacrifices an abominable thing, which offends the God of Jacob §." Another precept, apparently of very little importance, is given in these words: "Ye shall not round the corners of your heads, neither shalt thou mar the corners of thy beard." But its wisdom is seen at once, when we know that at funerals it was the practice of many of the heathens, in that early period, to round the corners of their heads, and mar their beards, that by throwing the hairs they had cut off upon the dead body, or the funeral pile, they might propitiate the shade of the departed hero; and that in other nations, particularly in Phœnicia, it was customary to cut off all the hair of their heads except what grew upon the crown, which, with great solemnity, was consecrated either to the sun or to Saturn †. The unlearned Christian, if he be a man of reflection, must read with some degree of wonder such laws as these: "Thou shalt not sow thy vineyard with divers seeds, lest the fruit of thy seed which thou hast sown and the fruits of thy vineyard be defiled. Thou shalt not plow with an ox and an ass together. Thou shalt not wear a garment of divers sorts, or of woollen and linen together †." But his wonder will cease when he knows that all these were practices from which the Sabian idolaters of the east expected the greatest advantages. Their belief in magic and judicial astrology led them to imagine, that by sowing different kinds of corn among their vines they should propitiate the gods which were afterwards known in Rome by the names of Bacchus and Ceres; that, by yoking animals so heterogeneous as the ox and the ass in the same plough, they should by a charm secure the favour of the deities who presided over the affairs of husbandry; and that a garment composed of linen and woollen, worn under certain conjunctions of the stars, would protect its owner, his flocks, his herds, and his field, from all malign influences, and render him in the highest

degree prosperous through the whole course of his life. But magical ceremonies, of which the very essence seems to have consisted in uniting in one group or jumble things never brought together by nature, were always performed in order to render propitious good or evil demons (see MAGIC); and therefore such ceremonies, however unimportant in themselves, were in that age most wisely prohibited in the Mosaic law, as they naturally led those who were addicted to them to the worship of idols and impure spirits.

If the whole ritual of the Jewish economy be examined in this manner, every precept in it will be found to be directed against some idolatrous practice of the age in which it was given. It was therefore admirably calculated to keep the Israelites a separate people, and to prevent too close an intercourse between them and their Gentile neighbours. And their civil institutes, even those which appear the most trifling, were all contrived with the most consummate wisdom to promote the same end. The distinction made by their law between clean and unclean animals (see SLAVERY, n^o 33.) rendered it impossible for them, without a breach of that law, to eat and drink with their idolatrous neighbours; their sacred and civil ceremonies being directly levelled against the Egyptian, Zabian, and Canaanitish superstitions, had a tendency to generate in their minds a keen contempt of those superstitions; and that contempt must have been greatly increased by their yearly, monthly, and daily sacrifices, of the very animals which their Egyptian masters had worshipped as gods.

That these laws might have the fuller effect upon minds gross and carnal, they were all enforced by temporal sanctions. This was indeed the natural and even necessary consequence of the theocratic government established in Israel; for when God condescended to become their supreme civil magistrate, he of course engaged to execute, either immediately by himself, or by the medium of his vicegerents the judges and the kings, all the offices included in such magistracy. Hence it is that Moses assured them, that if they would hearken to God's judgments, and keep them, and do them, they should be blessed above all people; threatening them at the same time with utter destruction if they should at all walk after other gods, and serve them, and worship them. Nor were these temporal rewards and punishments held out only to the nation as a collective body; they were promised and threatened to every individual in his private capacity as the certain consequences of his obedience or disobedience. Every particular Hebrew was commanded to honour his father and mother, that it might go well with him, and that his days might be prolonged; whilst he who cursed his father or his mother was surely to be put to death. Against every idolater, and even against the wilful transgressor of the ceremonial law, God repeatedly declared that he would set his face, and would cut off that man from among his people: and that individuals, as well as the nation, were in this life actually rewarded and punished according to their deserts, has been proved by bishop Warburton with a force of evidence which must carry conviction to every mind which his lordship's rude railings at some favourite system have not filled with prejudices against all his works. Indeed the Mosaic law, taken in its literal sense, holds out no other prospects to the Israelites than temporal happiness; such as, health, long life, peace, plenty, and dominion, if they should keep the covenant; and temporal misery, viz. disease, immature death, war, famine, want, subjection, and captivity, if they should break it. "See (says Moses), I have set before thee this day life and good, death and evil; in that I command thee this day to love the Lord thy God, to walk in his ways, and to keep his commandments, and his statutes, and his judgments, that

thou mayest live and multiply; and the Lord thy God shall bless thee in the land whither thou goest to possess it. But if thine heart turn away, so that thou wilt not hear, but shalt be drawn away, and worship other gods, and serve them; I denounce unto you this day, that ye shall surely perish, and that ye shall not prolong your days upon the land whither thou passest over Jordan to possess it." And elsewhere, having informed them that, upon their apostacy, their land should be rendered like Sodom and Gomorrah, he adds, that all men should know the reason of such barrenness being brought upon it, and should say, "Because they have forsaken the covenant of the Lord God of their fathers, which he made with them when he brought them forth out of the land of Egypt, the anger of the Lord was kindled against this land, to bring upon it all the curses that are written in this book." †

From this notorious fact, which hardly any man of letters will now dare to deny, some divines have concluded, we think rashly, that the ancient Israelites had no hope whatever beyond the grave; and that in the whole Old Testament there is not a single intimation of a future state. That many of the lowest vulgar, who could neither read nor write, were in this state of darkness, may be true; but it is impossible that such of them as understood the book of Genesis could be ignorant that death came into the world by the transgression of their first parents, and that God had repeatedly promised to redeem mankind from every consequence of that transgression. They must likewise have known that, before the deluge, Enoch was translated into heaven without tasting death; that afterwards Elijah had the same exemption from the common lot of humanity; and that, as God is no respecter of persons, every one who served him with the zeal and fidelity of these two prophets would, by some means or other, be made capable of enjoying the same rewards. The God of Abraham, Isaac, and Jacob, was not the God of the dead, but of the living.

In the earliest periods of their commonwealth, the Israelites could, indeed, only infer, from different passages of their sacred books, that there would be a general resurrection of the dead, and a future state of rewards and punishments; but from the writings of the prophets it appears, that before the Babylonish captivity that doctrine must have been very generally received. We shall not, in support of our opinion, quote the famous passage in the book of Job, because it is not determined at what period that beautiful and sublime poem was admitted into the Jewish canon; but in the Psalms, and in the prophecies of Isaiah, Daniel, and Ezekiel, there are several texts which seem to us to prove, incontrovertibly, that, at the time when these inspired books were written, every Israelite who could read the scriptures must have had some hopes of a resurrection from the dead. We shall consider two of these texts, because they have been quoted by a very learned and valuable writer in support of an opinion the reverse of ours.

In a sublime song, composed with a view to incite the people to confidence in God, the prophet Isaiah has these remarkable words; "Thy dead men shall live; together with my dead body shall they arise. Awake and sing, ye that dwell in the dust; for thy dew is as the dew of herbs, and the earth shall cast out the dead." We agree with bishop Warburton that these words are figurative, and that they were uttered to give the Israelites consolation in very disastrous times. The purpose of the prophet was to assure them, that though their community should, in Babylon, be as completely dissolved as a dead body reduced to dust, yet God would restore them to their own land, and raise that community again to life. This was indeed a prophecy only of a temporal deliverance; but as it is expressed in terms

Theology from the fall of Adam to the coming of Christ.

† Deut. xxx. 15-19. xxxix. 25. 157. Whence it has been rashly inferred that the ancient Hebrews had no hope beyond the grave.

Chap. xix. verse 25, &c.

158. This opinion confuted.

† Chap. xxvi. 19.

Th-ory from the full of dan-ty of Chrif. relating to the death and refurre&tion of man, the doctrine of a refurre&tion mu&ft then have been well known, and generally received. or fuch language would have been altogether unintelligible. No (fays the bifhop ; that the language might be intelligible, it was only neceffary that the Ifraelites fhould have diftinct ideas of a refurre&tion from the dead, without knowing that the natural body is indeed to rife again; and as he thinks that fuch metaphorical expreffions as this would have the greateft force where the doctrine of the refurre&tion was unknown, he concludes that it mu&ft have been unknown among the Ifraelites in the days of Ifaiah *.

Had there been no facred books among the Ifraelites before this prophecy was uttered, his lordfhip's reasoning would have been at leaft plausible, if not conclufive; but that a people who knew how death had entered into the world, who believed that they were by fome means or other to be freed from its fting, who, it is natural to fuppofe, often mediated upon the bruifing of the ferpent's head, and the nature of the bleffing which all nations were to derive from the feed of Abraham, fhould form diftinct ideas of a refurre&tion, and read this prophecy without believing that the natural body is indeed to rife again, we cannot poffibly conceive. The very fuppofition is one of his lordfhip's mo&ft irreconcilable paradoxes; and it is a paradox which his fyftem did not require him to fupport.

The prophet Ezekiel, when the ftate of things was mo&ft desperate, is carried by the Spirit into a valley full of dry bones, and afked this queftion; "Son of man, can thefe bones live?" To which he answers; "O Lord God, thou knoweft †;" an answer which the fame learned prelate thinks the prophet could not have made, had he been brought up in the knowledge and belief of a refurre&tion from the dead. Our opinion is directly the reverfe of that of his lordfhip, who feems to have miftaken the nature of this fcenical representation. The prophet was not afked if all the dead would rife at the la&ft day; but only if the particular bones then prefented to him could live at that time, and while other bones were mouldering in corruption: and to fuch a queftion we cannot conceive any answer that a man brought up in the belief of a general refurre&tion could have given, but—"O Lord God, thou knoweft." Had Ezekiel been a ft ranger to the doctrine of a general refurre&tion, or had he not believed that doctrine, he would doubtlefs have answered the queftion that was put to him in the negative; but convinced that all men are at fome period to rife from the dead, "that every one may receive the things done in his body, according to that he hath done, whether it be good or bad," he very naturally faid, that God alone knew whether the bones then exhibited to him in the valley would rife before the general refurre&tion.

But though the more intelligent and righteous Ifraelites certainly "all died in faith, and not having received the promifes, but having feen them afar off, were perfuaded of them and embraced them, confeffing that they were ft rangers and pilgrims on earth, who defired a better country, that is, a heavenly one †," we are not to fuppofe that this heavenly defire arofe from any thing taught in the law of Mofes. That law, when taken by itfelf, as unconnected with prior and fubfequent revelations, makes no mention whatever of a heavenly inheritance, which St Paul affures us † was given 430 years before to Abraham by a promife which may be traced back to the firft ray of comfort vouchsafed to fallen man in the fentence paffed on the original deceiver. "Wherefore then ferved the law? It was added (fays the apoftle), becaufe of tranfgreffions, till the feed fhould come to whom the promife was made." The tranfgreffions here alluded to were polytheifm and idolatry, which, with their never-failing train of cruel and deteftable vices, had overfpread the whole world; and the primary intention of the law was to ft em the torrent of thefe corruptions, for which we have feen it was admirably calculated; and, like a fchoolmafter, to intru&ct the Ifraelites in the unity and worfhip of Jehovah, and thus by degrees bring them to Chri&ft.

But though it is apparent that a future ftate of rewards and punifhments made no part of the Mofaic difpenfation, yet the law had certainly a fpiritual meaning to be understood when the funnels of time fhould come. Every Chri&ftian fees a ft riking refemblance between the facrifice of the pafchal lamb, which delivered the Ifraelites from the deftroying angel in Egypt, and the facrifice of the Lamb of God, which taketh away the fin of the world. Indeed the whole ritual of facrifice mu&ft have led the more intelligent of them to faith in a future facrifice; by which, while the heel of the feed of the woman fhould be bruifed, the head of the ferpent fhould be completely cru&fted (fee SACRIFICE); and as prophets were raifed up from time to time, to prepare them for the coming of the Mefiah, and to foretel the nature of his kingdom, there can be no doubt but that thofe infpired teachers would lay open to them, as far as was expedient, the temporary duration of the Mofaic law, and convince them that it was only the fhadow of better things to come. From the nature of their ritual, and the different prophecies vouchsafed them, which became more and more explicit as the time approached for their accomplifhment, they mu&ft furely have been led to expect redemption from the curfe of the fall by the fufferings of their Mefiah; but that any one of them knew precifely the manner in which they were to be redeemed, and the nature of that religion which was to fupervene their own, is wholly incredible (B). Such knowledge would have

(B) This doctrine is ftated in fo clear a light by bifhop Bull, whom, as a divine, we think the glory of the church of England, and who has had few inferiors in any church, that the learned reader will be pleafed to have his opinions in his own words. "An igitur, inquires, fuerunt fub lege, qui vitam æternam fperarent? Refp. Qui meliores erant et peripicaciores in populo Judaico, verofimile eft eos feu generalium promiffionum vi, feu temporalium bonorum levi æ&ftimatione, feu divine bonitatis intuitu, feu animæ fux, melioris quam caduci boni appetentis, confideratione, feu Enochi exemplo (cui fequiori ævo accellit Eliæ raptus) feu Patriarcharum traditione, quibus Deus multis indicis fpem futuorum bonorum fecerat, in quorum indiciorum genere non minimum erat et illud, quod multi eximie boni terre&tris felicitatis expertes vixerint, quod argumentum late exequitur Scriptor ad Hebræos cap. 11.) feu aliis rationibus adducto credidiffe, Deum, præter fpecialia ifta bona ad hanc vitam pertinentia, et legibus Mofaicis comprehenfa, etiam alia po&ft mortem cultoribus fuis fidis largiri velle. Imo ftatuendum illud omnino eft, ne viros fãctos eximio&que in populo Dei fuum inftar tum vixiffe, tum devixiffe credatur. Nec refert, quod hujus fidei vix ac ne vix quidem ulla in Canonici V. T. Scripturis mentio fiat. Nam certum eft, Abrahamum filium promiffionis, mactare juffum non recu&faffe, hac ratiocinatione luftentatum, Deum potentia tanta præditiim efte, ut filium jam mortuum in vitam revocare, eumque ei redivivum reftituere poffet. Certum, inquam, illud eft, quia divinus Autor Epiftole ad Hebræos id diferte teftatur,

have made them impatient under the yoke of ordinances to which they were subjected; for after the Christian faith came into full splendour, mankind could be no longer under the tuition of such a schoolmaster as the law, which "had only a shadow of good things; and so far from their reality, not even the very image of them †." Through these shadows, however, the Jews, aided by the clearer light of prophecy, though it too shone in a dark place, might have seen enough of God's plan of redemption to make them acknowledge Jesus of Nazareth, when he came among them working miracles of mercy, for the Messiah so long promised to their forefathers, and in whom it was repeatedly said, that all the nations of the earth should be blessed.

While such care was taken to prepare the descendants of Abraham for the coming of the Prince of Peace, we must not suppose that God was a respecter of persons, and that the rest of the world was totally neglected. The dispersion of the ten tribes certainly contributed to spread the knowledge of the true God among the eastern nations. The subsequent captivity of the tribes of Judah and Benjamin must have confirmed that knowledge in the great empires of Babylon and Persia; and that particular providence of God which afterwards led Ptolemy Philadelphus to have the Jewish scriptures translated into the Greek language, laid the divine oracles open to the study of every accomplished scholar. At last, when the arms of Rome had conquered the civilized world, and rendered Judea a province of the empire; when Augustus had given peace to that empire, and men were at leisure to cultivate the arts and sciences; when the different sects of philosophers had by their disputations whetted each others understandings so that none of them was disposed to submit to an imposture; and when the police of the Roman government was such that intelligence of every thing important was quickly transmitted from the most distant provinces to the capital of the empire; "when that fulness of time was come, God sent forth his Son made of a woman, made under the law, to redeem them that were under the law, that we might receive the adoption of sons," and be restored to that inheritance of which the forfeiture introduced the several dispensations of revealed religion into the world.

SECT. V. *View of Theology, more peculiarly Christian.*

MANKIND being trained by various dispensations of providence for the reception of that seed of Abraham, in whom all the nations of the earth were to be blessed, and the time fixed by the Jewish prophets for his coming being arrived, "a messenger was sent before his face to prepare his way before him by preaching the baptism of repentance for the remission

of sins." This messenger was John the Baptist, a very extraordinary man, and the greatest of all the prophets. His birth was miraculous, the scene of his ministry the wilderness, his manners austere, and his preaching upright, without respect of persons. He frankly told his audience that he was not the Messiah, that the Messiah would soon appear among them, that "he was mightier than himself, and that he would baptise them with the Holy Ghost and with fire."

Mightier indeed he was; for though born of a woman the Messiah was not the son of a human father; and though living for the first thirty years of his life in obscurity and poverty, he was the lineal descendant of David, and heir to the throne of Israel. But the dignity of his human descent, great as it was, vanishes from consideration when compared with the glory which he had with his Father before the world was. The Jewish dispensation was given by the ministry of Moses, and illustrated by subsequent revelations vouchsafed to the prophets; the immediate author of the Christian religion is the *Word* or second person of the blessed Trinity, of whom St John declares, that "he was in the beginning with God, and was God; that all things were made by him; and that without him was not any thing made that was made." We have already proved that in the one Godhead there is a Trinity of persons; and that the *Word* is one of the three, is apparent from these words of the apostle, and from many other passages of sacred scripture. Thus he is called *the Lord of his own himself; the first and the last, besides whom there is no God; the most high God; God blessed for ever; the mighty God, the everlasting Father, Jehovah our righteousness; and the only wise God our Saviour* (c). This great Being, as the same apostle assures us, was made flesh, and dwelt among men; not that the divine nature was or could be changed into humanity; for God is immutable, the same Almighty and incomprehensible Spirit yesterday, to day, and forever; but the word or second person in the godhead, assuming a human soul and body into a personal union with himself, dwelt upon earth as a man, veiling his divinity under mortal flesh. Hence he is said elsewhere to have been "manifested in the flesh," and "to have taken upon him the nature of man;" phrases of the same import with that which asserts "the *WORD* to have been made flesh."

This incarnation of the Son of God is perhaps the greatest mystery of the Christian faith, and that to which ancient and modern heretics have urged the most plausible objections. The doctrine of the Trinity is indeed equally incomprehensible; but the nature of God and the mode of his subsistence, as revealed in scripture, no man, who thinks, can be surprised that he does not comprehend; for a revelation which should teach nothing mysterious on such a subject would be as incredible and as useless as another which

The law, peculiarly Christian.
162 Christ the divine Word incarnate.

162 Objections to the incarnation of the word

cap. 11. 19. Hujus tamen vere admirandæ fidei, atque Evangelicæ supparis, in historia Abrahami nec volam, nec vestigium reperias. Præterea floruerunt singulis sæculis in populo Judaico Viri Dei ac Prophetæ cælestis edocæi, quos, inter tot arcana ipsis patefacta, mylticum hunc legis sensum penitus ignorasse, nihilque de futura vita intellexisse, nemo prudens suspicabitur. Cum autem nefas sit vel cogitasse, Viros optimos sapientiam, qua ipsi pollebant, aliis invidisse, credendum omnino est, eos, sicubi idoneos invenerint Auditores, evoluisse iis oblecta in lege mysteria, singulisque tantum aperuisse, quantum captus ipsorum et utilitatis ratio serebat. In publicis autem concionibus Prophetæ ac Sapientes ita loquebantur, ut nec in contemptum adducerent arcana sanctioris disciplinæ, et tamen Auditorem attentum ad investigandi sollicitudinem excitarent. Atque hinc natum arbitratu maximo Grotius discrimen antiquitatis inter Judæos celebratum, scriptæ legis, et legis oralis, quam et קבלה i. e. παράδοσις seu Traditionem vocant; utramque dicentes a Mose profectam: non quod res aliæ fuerint in traditione quam in lege scripta; sed quod ea quæ in lege scripta occultius continebantur, studiosis indagatoribus enodaret accuratior interpretatio. *Harmonia Apostolica*, Dissert. post. cap. 10.

Theology. contained nothing but *mystery*. The difficulty respecting the incarnation, which forces itself upon the mind, is not more peculiarly Christian. low two natures so different as the divine and human can be so intimately united as to become one person; for this union in itself is not more inconceivable than that of the soul and body in one man: but that which at first is apt to stagger the faith of the reflecting Christian is the infinite distance between the two natures in Christ, and the comparatively small importance of the object, for the attainment of which the eternal Son of God is said to have taken upon him our nature.

164
Obviated.

Upon mature reflection, however, much of this difficulty will vanish to him who considers the ways of Providence, and attends to the meaning of the words in which this mystery is taught. The importance of the object for which the word condescended to be made flesh, we cannot adequately know. The oracles of truth indeed inform us, that Christ Jesus came into the world to save sinners; but there are passages scattered through the New Testament * which indicate, not obscurely, that the influence of his sufferings extends to other worlds besides this: and if so, who can take upon him to say, that the quantity of good which they may have produced was not of sufficient importance to move even to this condescension a Being who is emphatically styled LOVE ?

* Eph. i.
10. Col. i.
12, 20.

But let us suppose that every thing which he did and taught and suffered was intended only for the benefit of man, we shall, in the daily administration of providence, find other instances of the divine condescension; which, though they cannot be compared with the incarnation of the second person in the blessed Trinity, are yet sufficient to reconcile our understandings to that mystery when revealed to us by the Spirit of God. That in Christ there should have dwelt on earth "all the fulness of the Godhead bodily ||," is indeed a truth by which the devout mind is overwhelmed with astonishment; but it is little less astonishing that the omnipotent Creator should be intimately present at every instant of time to the meanest of his creatures, "upholding all things, the vilest reptile as well as the most glorious angel, by the word of his power †." Yet it is a truth self-evident, that without this constant presence of the Creator, nothing which had a beginning could continue one moment in being; that the visible universe would not only crumble into chaos, but vanish into nothing; and that the souls of men, and even the most exalted spirits of creation, would instantly lose that existence, which, as it was not of itself, and is not necessary, must depend wholly on the will of him from whom it was originally derived. See METAPHYSICS, n^o 272—276, and PROVIDENCE, n^o 3.

Col. ii.

† II. b.
i. 3.

In what particular way God is present to his works, we cannot know. He is not diffused through the universe like the *anima mundi* of the ancient Platonists, or that modern idol termed the *substratum of space* (METAPHYSICS, n^o 309, 310.); but that he is in power as intimately present now to every atom of matter as when he first brought it into existence, is equally the dictate of sound philosophy and of divine revelation; for "in him we live and move and have our being;" and power without substance is inconceivable. If then the divine nature be not debased, if it cannot be debased by being constantly present with the vilest reptile on which we tread, why should our minds recoil from the idea of a still closer union between the second person of the ever blessed Trinity and the body and soul of Jesus Christ? The one union is indeed different from the other, but we are in truth equally ignorant of the nature of both. Reason and revelation assure us that God must be present to his works to preserve them in existence; and revelation informs us farther, that one of the persons in the Godhead

assumed human nature into a personal union with himself, to redeem myriads of rational creatures from the miserable consequences of their own folly and wickedness. The importance of this object is such, that, for the attainment of it, we may easily conceive that he who condescends to be potentially present with the worms of the earth and the grass of the field, would condescend still farther to be personally present with the spotless soul and body of a man. Jesus Christ lived indeed a life of poverty and suffering upon earth, but his divine nature was not affected by his sufferings. At the very time when, as a man, he had not a place where to lay his head; as God, he was in heaven as well as upon earth *, dwelling in light inaccessible; and while, as a man, he was increasing in wisdom and stature, his divinity was the fulness of him who filleth all in all, and from whom nothing can be hid.

Perhaps the very improper appellation of *mother of God*, which at an early period of the church was given to the Virgin Mary, may have been one cause of the reluctance with which the incarnation has been admitted; for as we have elsewhere observed (see NESTORIUS), such language, in the proper sense of the words, implies what those, by whom it is used, cannot possibly believe to be true; but it is not the language of scripture. We are there taught, that "Christ being in the form of God, thought it no robbery to be equal with God; but made himself of no reputation, and took upon him the form of a servant, and was made in the likeness of man †;" that "God sent forth his Son made ‡ of a woman, made under the law, to redeem them that were under the law, that we might receive the adoption of sons ||;" and that "the word who was in the beginning with God, and was God, by whom all things were made, was made flesh, and dwelt among men (who beheld his glory, the glory as of the only begotten of the Father), full of grace and truth †:" but we are nowhere taught that, as God, he had a mother! It was indeed the doctrine of the primitive church ||, that the very principle of personality and individual existence in Mary's son, was union with the uncreated word; and this doctrine is thought to imply the miraculous conception, which is recorded in the plainest terms by two of the evangelists; for he was conceived by the Holy Ghost and born of a virgin §; but, as God, he had been begotten from all eternity of the Father. and in order of nature was prior to the Holy Ghost. This is evident from the appellation of *ὁ ἀγίος* given to him by St John; for the term being used in that age, both by the Jewish Rabbies and the heathen philosophers, to denote the second divine subsistence, which they considered as an eternal and necessary emanation from the first, sometimes called *ἄγαθόν* and sometimes *τοῦ*; and the apostle giving no intimation of his using the word in any uncommon sense, we must necessarily conclude, that he meant to inform us that the divinity of Christ is of eternal generation. That the term *λόγος* was used in this sense by the later Platonists, and in all probability by Plato himself, we have sufficiently shewn in another place (see PLATONISM); and that a similar mode of expression prevailed among the Jews in the time of St John, is apparent from the Chaldee paraphrase; which, in the 110th psalm, instead of the words "the Lord said unto my Lord," has, "the Lord said unto his word." Again, where we are told in the Hebrew that Jehovah said to Abraham §. "I am thy shield and thy exceeding great reward," we read in the Chaldee, "my word is thy shield, and thy exceeding great reward." Where it is said, "your new moons and your appointed feasts my soul hateth *," the paraphrast hath it, "my word hateth;" and where it is said, that "Israel shall be saved in the Lord with an everlasting salvation †," in the same paraphrast it is, "If

ology. rael shall be saved by the word of the Lord with everlasting salvation." But there is a passage in the Jerusalem Targum which puts it beyond a doubt, that by the Jews understood a divine person begotten of his Father before all worlds; for commenting on Genesis iii. 22. the authors of that work thus express themselves: "The word of the Lord said, behold Adam, whom I created, is the only begotten upon earth, as I AM THE ONLY BEGOTTEN IN HEAVEN:" in conformity with which, Philo introduces † the Logos speaking thus of himself; *Kai yap oute ayemllo us bios ar, oute; oute; us ou is. I am neither unbegotten, as God, nor begotten after the same manner as you are.*

From these quotations we may justly conclude, that the Nicene fathers expressed themselves properly when they declared that the only begotten Son of God was begotten of his Father before all worlds, and is God of God; for if St John had believed the word to be unbegotten, contrary to the belief of all who made use of the phrase at the time when he wrote, he would surely have expressed his descent from the generally received opinion. This however he is so far from doing, that he gives the amplest confirmation of that opinion, by declaring, that "he beheld the glory of the word incarnate as the glory of the only begotten of the Father;" for this declaration is true only of the divinity of Christ, his human nature not being begotten of the Father, but conceived by the Holy Ghost of the Virgin Mary. Hence our blessed Lord assures us, that "as the Father HATH life in HIMSELF, so hath he GIVEN the Son to have life in himself;" that "the Son can do nothing of himself, but what he seeth the Father do;" and that "he knew the Father, because he was from him and sent by him †." We must therefore agree with bishop Pearson (D), that "though the Father and Son are both truly God, and therefore equal in respect of nature, yet the one is greater than the other, as being the fountain of the Godhead. The Father is God, but not of God; Light, but not of Light. Christ is God, but of God; Light, but of Light. There is no difference or inequality in the nature or essence, because the same in both; but the Father of our Lord Jesus Christ hath that essence of himself, from none; Christ hath the same essence, not of himself, but from him."

The great purpose for which this divine person was sent into the world, and born of a woman, was to bruise the head of the serpent, and restore mankind to the inheritance which had been forfeited by Adam's transgression. Every dispensation of Providence from the fall had been preparatory to this restoration. Prophets had been raised from time to time to preserve in the early ages of the world the knowledge and worship of the true God: the children of Abraham, as we have seen, had been separated from the surrounding nations for the same purpose; and by the dispersion of the ten tribes, the captivity of the other two in

Babylon, and the translation of the Hebrew scriptures into the Greek language, much of the knowledge which had been revealed to the Israelites was gradually diffused over the eastern world.

But while the Jews were thus rendered the instruments of enlightening the heathen nations of antiquity, their intercourse with those nations made them almost unavoidably acquainted with the philosophy which was cultivated among the Chaldeans, the Persians, and the Egyptian Greeks; and in raising many of the opinions derived from those schools upon the doctrines of Moses and the prophets, they corrupted their own religion while they improved that of their neighbours. Hence, by the time that Christ came among them, they had made the word of God of none effect through a number of idle fancies which they inculcated on the people as the traditions of the elders; and as they had attached themselves to different masters in philosophy, their unauthorized opinions were of course different according to the different sources whence they were drawn. The peculiar tenets of the *ESSENES* seem to have been a species of mystic Platonism. The *PHARISEES* are thought to have derived their origin from a Jewish philosopher of the Peripatetic school; and the resemblance between the doctrines of the *SADDUCEES* and the philosophy of Epicurus has escaped no man's observation.

Though these sects maintained mutual communion in public worship, they abhorred each other's distinguishing tenets; and their eternal wranglings had well nigh banished from them every sentiment of true religion. They agreed, however, in the general expectation of the Messiah promised to their fathers; but, unhappily for themselves, expected him as a great and temporal prince. To this mistake several circumstances contributed: some of their prophets had foretold his coming in lofty terms, borrowed from the ritual law, and the splendour of earthly monarchs. The necessity of casting this veil over those living oracles we have shewn in another place (see PROPHECY, n^o 17.). At the time when the predictions were made, the Mosaic system had not run out half its course, and was therefore not to be exposed to popular contempt by an information that it was only the harsh rudiment of one more easy and perfect. To prevent, however, all mistakes in the candid and impartial, when the Messiah should arrive with the credentials of miraculous powers, other prophets had described him in the clearest terms as having no form nor comeliness, as a sheep dumb before his shearers, and as a lamb brought to the slaughter; but the Jews had suffered too much from the Chaldeans, the Greeks, and other nations by whom they had been conquered, and were then suffering so much from their masters the Romans, that their carnal minds could think of no deliverance greater than that which should rescue their nation from every foreign yoke.

What men earnestly wish to be true, they very readily believe.

167 purpose which Christ was intended to world.

Theology, more peculiarly Early Christianity.

168 Corruption of the Jews at the time of his coming.

(3) We beg leave to recommend to our readers this author's excellent exposition of the apostle's creed, as a work which will render them great assistance in acquiring just notions of the fundamental articles of the Christian faith. They will find it, we think, a complete antidote against the poison of modern Unitarians and modern Trinitarians; of whom the former teach that Jesus Christ was a mere man, the son of Joseph as well as of Mary; while the latter, running to the other extreme, maintain, that, with respect to his divinity, he is in no sense subordinate to the Father, but might have been the Father, the Son, or the Holy Ghost, according to the good pleasure of the eternal three. We have been at some pains to prove his divinity, and likewise his eternal generation; but in such a short compend as we must give, it seems not to be worth while to prove his miraculous conception. That miracle is plainly asserted in the New Testament in words void of all ambiguity; and as it is surely as easy for God to make a man of the substance of a woman as of the dust of the earth, we cannot conceive what should have induced any person professing Christianity to call it in question. The natural generation of Christ is a groundless fancy, which can serve no purpose whatever, even to the Unitarians.

Theology, more precisely
lawyer's Christian.

believe. Hence that people, losing sight of the yoke under which they and the whole human race were brought by the fall of Adam, mistaking the sense of the blessing promised to all nations through the seed of Abraham, and devoting their whole attention to the most magnificent descriptions of the Messiah's kingdom, expected in him a prince who should conquer the Romans, and establish on earth a universal monarchy, of which Jerusalem was to be the metropolis.

160
The objects of his preaching.

As our Saviour came for a very different purpose, the first object of his mission was to rectify the notions of his erring countrymen, in order to fit them for the deliverance which they were to obtain through him. Accordingly, when he entered upon his office as a preacher of righteousness, he embraced every opportunity of inveighing with becoming frankness against the false doctrines taught as traditions of the elders; and by his knowledge of the secrets of all hearts, he exposed the vile hypocrisy of those who made a gain of godliness. The Jews had been led, by their separation from the rest of the world, to consider themselves as the peculiar favourites of Jehovah; and the consequence was, that, contrary to the spirit of their own law, and the explicit doctrines of some of their prophets, they looked upon all other nations with abhorrence, as upon people physically impure. These prejudices the blessed Jesus laboured to eradicate. Having desired a lawyer, by whom he was tempted, to read that part of the law of Moses which commanded the Israelites to love their neighbours as themselves, he compelled him, by means of a parabolical account of a compassionate Samaritan, to acknowledge, that under the denomination of neighbour the divine lawgiver had comprehended all mankind as the objects of love.

|| St Luke
x. 25—38.

The importance in which Moses held the ritual law, and to which, as the means of preserving its votaries from the contagion of idolatry, it was justly intitled, had led the Jews to consider every ceremony of it as of intrinsic value and perpetual obligation: but Jesus brought to their recollection God's declared preference of mercy to sacrifice; shewed them that the weightier matters of the law, judgement, mercy, and faith, claimed their regard in the first place, and its ceremonial observances only in the second; and taught them, in conformity with the predictions of their own prophets †, that the hour was about to come when the worship of God should not be confined to Jerusalem, but that "true worshippers should everywhere worship the Father in spirit and in truth. ‡"

† Jeremiah
xxxi. 31,
&c.

‡ John iv.
25—27.

It being the design of Christ's coming into the world to break down the middle wall of partition between the Jews and Gentiles, and to introduce a new dispensation of religion which should unite all mankind as brethren in the worship of the true God, and fit them for the enjoyment of heaven; he did not content himself with merely restoring the moral part of the Mosaic law to its primitive purity, disencumbered of the corrupt glosses of the Scribes and Pharisees, but added to it many renewed and spiritual precepts, which, till they were taught by him, had never occurred either to Jew or Gentile. The Hebrew lawgiver had prohibited murder under the penalty of death; but Christ extended the prohibition to causeless anger, and to contemptuous treatment of our brethren, commanding his followers, as they valued their everlasting salvation, to forgive their enemies, and to love all mankind. Adultery was forbidden by the law of Moses as a crime of the deepest dye; but Jesus said to his disciples, "that whosoever looketh on a woman to lust after her, hath committed adultery with her already in his heart," and is of course liable to the Divine vengeance. The *lex talionis* was in force among the Jews, so that the man who had deprived his neighbour of an eye or a tooth, was to suffer the

loss of an eye or a tooth himself; but this mode of punishment, which inflicted *Ulexijb* for *Ulexijb*, though suited to the hardness of Jewish hearts, being inconsistent with the mild spirit of Christianity, was abolished by our blessed Lord, who severely prohibited the indulgence of revenge, and commanded his followers to love even their enemies. Perjury has in every civilized nation been justly considered as a crime of the highest atrocity, and the Mosaic law doomed the false witness to bear the punishment, whatever it might be, which he intended by swearing falsely to bring upon his brother; but the Author of the Christian religion forbade not only false swearing, but swearing at all, except on solemn occasions, and when an oath should be required by legal authority. See OATH

Theology more precisely
lawyer's Christian.

By thus restoring the law to its original purity, and in many cases extending its sense, the blessed Jesus executed the office of a PROPHET to the lost sheep of the house of Israel; but had he not been more than an ordinary prophet, he could not have abrogated the most trivial ceremony of it, nor even extended the sense of any of its moral precepts; for their great lawgiver had told them, that "the Lord their God would raise up unto them but one Prophet, like unto him, to whom they should hearken †." That Prophet was by themselves understood to be the Messiah, whom they expected to tell them all things. It was necessary therefore that Jesus, as he taught some new doctrines, and plainly indicated that greater changes would soon be introduced, should vindicate his claim to that exalted character which alone could authorize him to propose innovations. This he did in the amplest manner, by fulfilling prophecies and working miracles (see MIRACLE and PROPHECY); so that the unprejudiced part of the people readily acknowledged him to be of a truth "that prophet which should come into the world—the Son of God, and the King of Israel." He did not, however, make any change in the national worship, or assume to himself the smallest civil authority. He had submitted to the rite of circumcision, and strictly performed every duty, ceremonial as well as moral, which that covenant made incumbent upon other Jews; thus fulfilling all righteousness. Though the religion which he came to propagate was in many respects contrary to the ritual law, it could not be established, or that law abrogated, but in consequence of his death, which the system of sacrifices was appointed to prefigure; and as his kingdom, which was not of this world, could not commence till after his resurrection, he yielded during the whole course of his life a cheerful obedience to the civil magistrate, and wrought a miracle to obtain money to pay the tribute that was exacted of him. Being thus circumstanced, he chose from the lowest and least corrupted of the people certain followers, whom he treated with the most endearing familiarity for three years, and commissioned at his departure to promulgate such doctrines as, consistently with the order of the divine dispensations, he could not personally preach himself. With these men, during the course of his ministry on earth, he went about continually doing good, healing the sick, casting out devils, raising the dead, reproving vice, preaching righteousness, and instructing his countrymen, by the most perfect example which was ever exhibited in the world, of whatsoever things are true, or honest, or just, or pure, or lovely, or of good report. The Scribes and Pharisees, however, finding him not that conqueror whom they vainly expected, becoming envious of his reputation among the people, and being filled with rancour against him for detecting their hypocritical arts, delivered him up to the Roman governor, who, though convinced of his innocence, yielded to the popular clamour, and crucified him between two thieves, as an enemy to Cæsar.

170
In which he executed the office of a prophet.

Deut. viii. 15.

171
His strict obedience to the law.

Just before he expired, he said, It is finished, intimating that the purpose was now fulfilled for which he had come into the world, and which, as he had formerly told his disciples, "was not to be ministered unto but to minister, and to give his life a ransom for many." For his blood, as he assured them at the institution of the Eucharist, "was to be shed for the remission of sins." That Christ died voluntarily for us, the just for the unjust, and that "there is none other name under heaven given among men whereby we must be saved;" is the uniform doctrine of the prophets who foretold his coming, of John the Baptist who was his immediate harbinger, and of the apostles and evangelists who preached the gospel after his ascension into heaven. Thus Isaiah says of the Messiah †, that "he was wounded for our transgressions, and bruised for our iniquities; that the chastisement of our peace was upon him, and that with his stripes we are healed; that we had all like sheep gone astray, turning every one to his own way, and that the Lord laid on him the iniquity of us all; that he was cut off out of the land of the living, and stricken for the transgression of God's people; that his soul or life was made an offering for sin; and that he bore the sin of many, and made intercession for the transgressors." The Baptist, "when he saw Jesus coming unto him, said to the people, Behold the Lamb of God, which taketh away the sin of the world;" plainly intimating that his death was to be a sacrifice, since it was only as a sacrifice that the Jews could form any conception of a lamb taking away sin. The epistles of St Paul are so full of the doctrine of Christ's satisfaction, that it is needless from his writings to quote particular texts in proof of it. He tells the Romans, that Jesus Christ was set forth to be a propitiation through faith in his blood; that he was delivered for our offences, and "raised again for our justification; that he died for the ungodly; and that God commendeth his love towards us, in that while we were yet sinners Christ died for us." He assures the Corinthians that Christ died for all; that they who live should not henceforth live unto themselves, but to him who died for them and rose again; and that God made him to be sin for us who knew no sin, that we might be made the righteousness of God in him. He informs the Galatians, that Christ "gave himself for our sins, that he might deliver us from this present evil world, according to the will of God and our Father; and that he redeemed us from the curse of the law, being made a curse for us." St Peter and St John talk the very same language; the former teaching us, that "Christ suffered for us, and bare our sins in his own body on the tree †; the latter, that the blood of Jesus Christ cleanseth us from all sin, and that he is the propitiation for our sins: and not for our's only, but also for the sins of the whole world †." That he came into the world for the purpose of suffering, appears from his own words: for "no man (said he †) taketh my life from me, but I lay it down of myself: I have power to lay it down, and I have power to take it again. This commandment have I received from my Father." And that he voluntarily laid it down for mankind, is evident from his calling himself the Good Shepherd, and adding, that "the Good Shepherd giveth his life for the sheep *."

That Christ died for the benefit of the human race, is a truth so apparent from these texts, and from many others which might be quoted, that no man professing Christianity has hitherto called it in question. Very different opinions have been formed indeed concerning the nature and extent of that benefit, and the means by which it is applied; but that the passion and death of the blessed Jesus were essential parts of his ministry on earth, has never been controverted, unless perhaps by those modern Unitarians who have cor-

rected the errors of the apostles and evangelists, and with whose writings we acknowledge ourselves to be very little acquainted. That on the cross he made satisfaction to his Father for the sins of the world, is the general belief of Christians; but presumptuous men, aiming at being wise beyond what is written, have started a thousand idle questions concerning the necessity of such satisfaction, and the manner in which it was made. Some limiting the power and mercy of the Omnipotent, have dared to affirm that God could not have pardoned man without receiving full satisfaction for his offences; that nothing but the shedding of the blood of Christ could make that satisfaction; that his death was indeed sufficient to atone for a thousand worlds; that, however, he did not die for all mankind, but only for a chosen few, ordained to eternal life by a secret decree before the foundation of the world; and that the rest of the race are passed by, and doomed to eternal perdition, for the glory of God's justice. Others, convinced by every thing around them that the Creator and Governor of the universe is a being of infinite benevolence, whose only end in giving life must have been to communicate happiness, have contended, that no atonement whatever could be necessary to obtain from him the forgiveness of sin upon sincere repentance; that it is contrary to all our notions of justice to punish the innocent for the guilty; and that therefore the death of Christ, though an essential part of his ministry, could not be necessary, but at the most expedient.

We enter not into these invidious debates. The Scriptures have nowhere said what God could or could not do; and on this subject we can know nothing but what they have taught us. That "we are reconciled to God by the death of his Son," is the principal doctrine of the New Testament; and without presuming to limit the power, the mercy, or the wisdom, of him who created and sustains the universe, we shall endeavour to show that it is a doctrine worthy of all acceptance. In doing this, we shall state impartially the opinions which men really pious have held respecting the form or manner in which Christ by his death made satisfaction to God for the sins of the world; and we hope that our readers, disregarding what may be prejudices in us, will embrace that opinion which shall appear to them most consonant to the general sense of sacred Scripture.

The strictest adherents to the theological system of Calvin, interpreting literally such texts of Scripture as speak of his being *made sin* for us, of his *bearing our sins in his own body on the tree*, and of the Lord's *laying on him the iniquity of us all*, contend, that the sins of the elect were lifted off from them and laid upon Christ by *imputation*, much in the same way as they think the sin of Adam is imputed to his posterity. "By bearing the sins of his people (says Dr Gill *), he took them off from them, and took them upon himself, bearing or carrying them as a man bears or carries a burden on his shoulders. There was no sin in him inherently, for if there had, he could not have been a fit person to make satisfaction for it; but sin was put upon him by his Divine Father, as the sins of the Israelites were put upon the scape-goat by Aaron. No creature (continues he) could have done this; but the Lord hath laid on him, or made to meet on him, the iniquity of us all, not a single iniquity, but a whole mass and lump of sins collected together, and laid as a common burden upon him; even the sins of all the elect of God. This phrase of laying sin on Christ is expressive of the *imputation* of it to him; for it was the will of God not to impute the transgressions of his elect to themselves, but to Christ, which was done by an act of his own; for he hath made him to be sin for us; that is, by *imputation*, in which way we are made the righteousness of God in him; that

That being imputed to us by him as our sins were to Christ. The sense (says our author) is, a charge of sin was brought against him as the surety of his people. He was numbered with the transgressors; for bearing the sins of many, he was reckoned as if he had been a sinner himself, sin being imputed to him; and was dealt with as such. Sin being found upon him by imputation, a demand of satisfaction for sin was made, and he answered it to the full. All this was with his own consent. He agreed to have sin laid upon him, and imputed to him, and a charge of it brought against him, to which he engaged to be responsible; yea, he himself took the sins of his people upon him; so the evangelist Matthew has it, 'Himself took our infirmities, and bore our sicknesses †.' As he took the nature of men, so he took their sins, which made his flesh to have *the likeness of sinful flesh*, though it really was not sinful. What Christ bore being laid upon him, and imputed to him, were *sins* of all sorts, original and actual; sins of every kind, open and secret, of heart, lip, and life; all acts of sin committed by his people, for he has redeemed them from all their iniquities; and God, for Christ's sake, *for-gives* all trespasses, his blood cleanses from all sin, and his righteousness justifies from all; all being imputed to him as that is to them. Bearing sin supposes it to be a burden; and indeed it is a burden too heavy to bear by a sensible sinner (†). When sin is charged home upon the conscience, and a faint groans, being burdened with it, what must that burden be, and how heavy the load which Christ bore, consisting of all the sins of all the elect from the beginning of the world to the end of it? and yet he sunk not, but stood up under it; failed not, nor was he discouraged, being the mighty God, and the Man of God's right hand, made strong for himself.

† Chap. viii. 17.

175 Objected to.

To the Arminians or Remonstrants, this doctrine of the imputation of the sins of men to the Son of God appears as absurd as the similar doctrine of the imputation of the sin of Adam to his unborn posterity; and it is certainly attended with consequences which have alarmed serious Christians of other denominations.

Were it possible in the nature of things, says the Arminian, to transfer the guilt of one person to another, and to lay it upon him as a burden, it could not be done without violating those laws of equity which are established in the scripture and engraven on the human heart. But this is not possible. To talk of lifting lumps of sin or transferring them like burdens from the guilty to the innocent, is to utter jargon, says he, which has no meaning: and we might with as much propriety speak of lifting a scarlet colour from a piece of cloth and laying it on the sound of a trumpet, as of literally lifting the sins of the elect from them and laying them on Christ. Guilt is seated in the mind; and no man can become a sinner but by an act of volition. If Christ there'ore *really* took upon him the sins of his people, he must have deliberately formed a wish to have actually committed all those sins; but such a wish, though it would have made him inherently guilty, and therefore incapable of satisfying for sin, could not have cancelled deeds that were done before he was born, or have made those innocent who had really been sinners. A deed once done cannot be undone; a volition which has been formed cannot be annihilated. By sincere repentance, the habitual dispositions are indeed changed, and those who have been sinners become objects of mercy; but no power can recal the hours that are past, or make those actions which have been performed to have been not

performed. To remove guilt from the sinner and lay it upon the innocent may therefore be safely pronounced impossible even for Omnipotence itself, for it implies that a thing may be and not be at the same instant of time; and the doctrine which teaches that this removal was made from the elect to Christ, is an imagination of yesterday, which has no countenance from scripture, and is contrary to the established constitution of things. Those who imagine that guilt may be propagated from father to son, have something like an argument to urge for the imputation of Adam's sin to his numberless posterity; for all the men and women who have by ordinary generation been introduced into the world, have undoubtedly derived their nature from the primeval pair. But Christ did not derive his nature from the elect, that their sins should be communicated to him; nor, as he was miraculously conceived by the Holy Ghost, can we attribute to him any degree of that *stain* which is supposed to have been conveyed from Adam to all the other generations of men.

Nothing more, therefore, can be meant by "Christ's bearing made sin for us," and "bearing our sins in his own body on the tree," or by God's "laying upon him the iniquity of us all," than that by his sufferings we are freed from the punishment of our sins; it being in scripture a common figure of speech, as even Dr Gill has somewhere acknowledged, to denote by the word *sin* the *consequencers* of sin. That this figure is used in those texts from which he infers that Christ took the sins of the elect upon himself, is evident from the verse which he quotes from the gospel of St Matthew; in which it is said, that "himself took our infirmities and bore our sicknesses." The sicknesses and infirmities there alluded to are the leprosy, the palsy, the fever, and demoniacal possessions: but when our blessed Lord cured these diseases, surely he did not by his omnipotent word lift them off from the patients and take them on himself, so as actually to become a leper, a paralytic, and a demoniac, or even to be reckoned as such either by the multitude, or by the priests whose duty it was to take cognizance of every legal uncleanness*. And if his inveterate enemies did not *impute* to him the leprosy when he removed that plague from others, why should it be supposed that his own Father, to whom he was at all times well-pleasing, *imputed* to him those sins of which, by his sufferings, he removed the punishment from those who were guilty? To impute to a person any action, whether virtuous or vicious, which he did not perform, can proceed only from ignorance, or malice, or partiality; but God is no respecter of persons, and from ignorance and malice he is removed to an infinite distance. It is indeed an undoubted truth, that "the Lord Jesus, by his perfect obedience and sacrifice of himself, which he through the eternal spirit once offered up unto God, hath fully satisfied the justice of his Father; and purchased not only reconciliation, but an everlasting inheritance in the kingdom of heaven for all those whom the Father hath given him †;" but that he actually took upon himself the sins of mankind, or that those sins were imputed to him by God, who punished him as a person whom he considered as guilty, is a doctrine equally injurious to the justice of the Father and to the immaculate purity of the Son.

The earnestness with which this doctrine was inculcated by some of the earliest reformers, and the impossibility of admitting it, which every reflecting and unprejudiced mind must feel, was probably one of the causes which drove So-

Theo' more than Cl' sian.

177 They probably consented to make a society of the doctrine of redemption.

(†) By the phrase a *sensible sinner*, the learned author means a sinner who is not past feeling, but has a conscience alive to the sense of remorse.

II. cians as this followers to the other extreme of denying Christ's satisfaction altogether, and considering his death as nothing more than that of an ordinary martyr, permitted for the purpose of attesting the truth of his doctrine, and paving the way for his resurrection, to confirm the great promise of immortality. According to these men, forgiveness is freely dispensed to those who repent, by the essential goodness of God, without regard to the merit or sufferings of any other being; and the gospel is said to save from sin, because it is the most perfect lesson of righteousness. The great objection of *Cressius* to the doctrine of the satisfaction is, that it is a hinderance to piety; for if Christ has paid the whole debt, he thinks that we must have nothing to do, as nothing more can be required of us. And if it were indeed true that our sins are imputed to Christ, and his righteousness imputed to us, this objection would be insurmountable; for God could not justly exact a double punishment for the same sin, or inflict misery upon those to whom he imputes perfect righteousness. But as to this imaginary transferring of virtues and vices from one person to another, the Christian scriptures give no countenance; so they nowhere call the death of Christ a *satisfaction* for the sins of men. The term has indeed been long in use among divines, and when properly explained it may be retained without any danger; but in treating of this subject, it would perhaps be more prudent to restrict ourselves to the use of scripture language, as the word *satisfaction* carries in it the ideas of a debt paid and accepted; whereas it is said by St Paul, that "eternal life is the gift of God through Jesus Christ our Lord; and that we are justified freely by his grace through the redemption that is in Jesus Christ, whom God hath set forth to be a propitiation through faith in his blood."

To clear up this matter, and attain adequate notions of redemption and justification, it will be necessary to look back to the fall of our first parents; for the great purpose for which Christ was promised, and for which he came into the world, was, by bruising the head of the serpent, to restore mankind to the inheritance which they had lost through the transgression of Adam. This is apparent not only from the original promise made to the woman, but also from different passages in the epistles of St Paul, who expressly calls Christ the second Adam, and says, that, "as by the offence of one, judgment came upon all men to condemnation; even so by the righteousness of one, the free-gift came upon all men unto justification of life;" that "as by one man's disobedience many were made sinners, so by the obedience of one shall many be made righteous;" and that, "as in Adam all die, even so in Christ shall all be made alive." Hence it was that John the Baptist, when he saw Jesus coming to him, said to his disciples †, "Behold the Lamb of God which taketh away, not the sins, but the sin of the world," evidently alluding to Adam's sin and its consequences, since no other sin was ever committed of which the consequences extend to the whole world.

This being the case, it is undeniable, that whatever we lost in the first Adam is restored to us by the second; and therefore they who believe that the punishment denounced against eating the forbidden fruit was death *corporal*, *spiritual*, and *eternal*, must believe that we are redeemed from all these by Christ; who having "appeared once in the end of the world to put away sin by the sacrifice of himself, died for us, that whether we wake or sleep we should live together with him *." If the image of God in which man was created was lost by the breach of the first covenant, it is more than restored to us "by the Mediator of a better covenant, which is established upon better promises;" if by the sin of Adam we were utterly indisposed, disabled,

and made opposite to all that is spiritually good, and wholly inclined to all evil, and that continually, we are freed from that dreadful curse by "our Saviour Jesus Christ, who gave himself for us, that he might redeem us from all iniquity, and purify to himself a peculiar people zealous of good works †;" and it for our share in the first transgression we be justly liable to all punishments in this world and in that which is to come, the apostle assures us, that "when we were enemies we were reconciled to God by the death of his Son, because that God was in Christ reconciling the world to himself, not imputing their trespasses unto them †." As Jesus is "the Lamb slain in the divine decree from the foundation of the world," these beneficial consequences of his death have been extended by a retrospective view to all in every age whose names are written in the book of life, though it is absurd to suppose that he literally took their sins upon him, and impious to imagine that he suffered under the imputation of sin.

Such is the general doctrine of redemption, as it is taught by the more moderate Calvinists and more moderate Remonstrants; for moderate Christians of all denominations, though they express themselves differently, have nearly the same views of the fundamental articles of their common faith. It must not, however, be concealed, that many divines of great learning and piety, though removed to an infinite distance from the school of Socinus, contend strenuously against the doctrine of vicarious atonement for actual transgressions of the moral law. These are the more zealous Arminians, who deny that we inherit any moral taint or intellectual weakness from our first parents, whom they believe never to have been in a state of greater perfection than many of their posterity who are called *degenerate*. According to them, we lost nothing by the fall of Adam but our title to eternal life or perpetual existence, together with those graces of the Holy Spirit which were bestowed under the first covenant to train mankind for the society of heaven; and as eternal life and supernatural grace constituted one free-gift, not due to the nature of man, or indeed of any created being, they might, when forfeited, be restored by any means or upon any condition which should seem expedient to the all-wise Donor. These means, and that condition, human reason cannot indeed discover; but it seems very fit that they should be different from the means by which moral agents under the law of nature can secure to themselves the favour of their Creator, or recover it when occasionally lost. The former depends on arbitrary will and pleasure, or at least upon no other principles discoverable by us; while the latter ariseth out of the established and well-known constitution of things. Thus moral virtue, comprehending piety, was the condition of that favour and protection which the creature man, in his original state, could claim from his Maker; but obedience to a positive command was the condition of the free gift of immortality conferred upon Adam on his introduction into paradise. The claim arising from the relation between the creature and the Creator is indissoluble, because that relation cannot be dissolved: so that the man who, by a transgression of the moral law, or of any part of that system which is called the *religion of nature*, has forfeited the favour of God, may reasonably hope to recover it by sincere repentance and a return to his duty; and nothing but such repentance and reformation can recover it; because, in a moral agent, nothing can be agreeable to God but moral dispositions, which cannot be transferred from one person to another, and for the want of which nothing can atone. Our virtues are not required nor our vices prohibited, as if the one could profit and the other injure him who created us; for "is it any pleasure to the Almighty that we are righteous? or is it

Theology, gain to him that we make our ways perfect? Will he re-
more pec- prove us for fear of us?" No! He commands us to be
liar, Chri- virtuous, and forbids us to be vicious, only because virtue is
stian. necessary to our own happiness, and vice productive of ever-
lasting misery.

Were an immoral man to be introduced into the society of angels and just men made perfect, he would not experience in that society what we are taught to expect from the joys of heaven; because to such joys his acquired dispositions would be wholly repugnant. Nor could the sufferings of any person whatever, or the imputation of any extrinsic righteousness, make that mind which had long been immersed in the grossest sensuality relish the intellectual and refined enjoyments of heaven; or the man who had been the habitual slave of envy, malice, and duplicity, a fit inhabitant of that place where all are actuated by mutual love. On the other hand, say the divines whose doctrine we are now detailing, it is impossible to suppose that the Father of mercies, who knows whereof we are made, should have doomed to eternal misery any moral agent who had laboured through life to serve him in sincerity and in truth; or that any atonement could be necessary to redeem from the pains of hell the man whose pious and virtuous dispositions have through penitence and prayer become suited to the society of heaven. Unsinning perfection never was nor ever could be expected in man. He is brought into the world free indeed from vice, but equally destitute of virtue; and the great business of his life is to guard his mind from being polluted by the former, and to acquire dispositions habitually leading to the practice of the latter. Till these habits be fairly formed, it seems impossible that he should not sometimes deviate from the paths of rectitude, and thereby incur a temporary forfeiture of the divine favour; but the very constitution of his mind, and the purpose for which he is placed in a state of probation, show that the divine favour thus forfeited can be recovered only by repentance and reformation.

Widely different, however, is the case with respect to the forfeiture and recovery of a free gift, to which man has no natural claim. When the condition is broken on which such a gift was bestowed, repentance can be of no avail; it must be either irrecoverably lost, or restored by the mere good pleasure of the giver. Immortality or perpetual existence is a gift which upon certain terms was freely bestowed upon the human race, and forfeited by the transgression of their first parent violating those terms. It was restored by the free grace of God, who was pleased to ordain, that "since by man came death, by man should also come the resurrection of the dead; for as in Adam all die, even so in Christ shall all be made alive." Hence the apostle, writing to the Romans of the benefits of being the children of God, and joint-heirs with Christ, summeth up those benefits with the resurrection from the dead." For the creature, *i. e.* mankind, was made subject (says he *) to vanity or death, not willingly, but by reason of him who hath subjected the same in hope: because the creature itself also shall be delivered from the bondage of corruption into the glorious liberty of the children of God. For we know that the whole creation groaneth, and travaileth in pain together until now: and not only *they*, but *ourselves* also, who have

the first fruits of the spirit, even we ourselves, groan within ourselves, waiting for the adoption, viz. the redemption of our body (v). That this redemption of our body is the consequence of the sacrifice of Christ, is taught in the most explicit terms in the epistle to the Hebrews; of which the inspired author informs us, that "forasmuch as the children are partakers of flesh and blood, he also himself likewise took part of the same; that through death he might destroy him that had the power of death, that is the devil; and deliver them, who through fear of death were all their life-time subject to bondage †." A vicarious atonement made with this view, the divines, whose theory we are now considering, acknowledge to be perfectly rational and consistent with the strictest justice. "The law of nature (say they §) allows not of vicarious atonements; but ordains that the man who transgresseth shall himself bear the punishment of his iniquity; a punishment which no man deserves for the faults of another, unless he be partaker of the guilt by joining in the transgression." And in proof of this their opinion, they appeal to the words of God himself, declaring to Moses, — "Whosoever hath sinned against me, him will I blot out of my book *." But when the free gift of immortality was lost, it was with great wisdom, say they, that God restored it through a Mediator who should make atonement by his blood for the breach of the first covenant; since such a mediation implies that the gift restored is merely of grace, to the attainment of which man could no further co-operate than by his hopes and wishes.

To this view of redemption, and indeed to every view of it which we have yet taken, an objection forces itself upon the mind. Throughout the New Testament LIFE AND IMMORTALITY are considered as a FREE gift, and called so in express words by St Paul *. To the scheme under consideration it is essential to consider them as such; and yet we know that a large price was paid for them, as St Paul likewise acknowledges, when he twice tells the Corinthians that they were bought with a price §.

"To clear up this matter (says bishop Warburton), and to reconcile the apostle to himself, who certainly was not defective either in natural sense or artificial logic, let us once again remind the reader, that life and immortality bestowed on Adam in paradise was a FREE gift, as appears from the history of his creation. As a free gift, it was taken back by the Donor when Adam fell; to which resumption our original natural rights are not subject, since natural religion teacheth, that sincere repentance alone will reinstate us in the possession of those rights which our crimes had suspended. So that when this tree gift, forfeited by the first Adam, was recovered by the second, its nature continuing the same, it must still remain a free gift—a gift to which man, by and at his creation, had no claim; a gift which natural religion did not bestow. But if misled by measuring this revealed mystery of human redemption by the scant idea of human transactions, where a free gift and purchased benefit are commonly opposed to one another, yet even here we may be able to set ourselves right, since, with regard to man, the character of a free gift remains to immortality restored. For the price paid for forfeited man was not paid by him, but by a Redeemer of divine extraction, who was pleased, by participating

§ 1 Cor. x. vii. 2. 183 Obviated

(F) That by the words *creature* and *creation* the apostle here means all mankind, and by *vanity* and *corruption*, death, the reader will find proved by Dr Whitby, in his note on the place, with a strength of argument which cannot be shaken; and that the whole creation, the Gentiles as well as the Jews, groaned and travailed in pain together under the apprehension of death, is apparent from the writings of Cicero, who always seems doubtful whether death be a good or an evil; and from the lamentation of Hezekiah, when desired by the prophet to set his house in order because he should die and not live.

icipating of man's nature, to stand in his stead. Hence the sacred writers seeing, in this case, the perfect agreement between a *FREE GIFT* and a *PURCHASED POSSESSION*, call it sometimes by the one and sometimes by the other name *."

A restoration to life and immortality from that state of unconsciouness or extinction as living agents, to which all mankind were doomed in consequence of the fall of Adam, is that great salvation which we have obtained through the blood of our Redeemer; and according to the theologians whose theory we are now considering, it was the only thing in the divine intention when the promise was given to the first mother that the seed of the woman should bruise the head of the serpent. But though they contend thus earnestly that the death of Christ does not operate *directly* as an atonement for the *actual* sins of men, they admit that it does so *indirectly* and by necessary consequence, since it gives opportunities for repentance and newness of life, which under the first covenant they did not enjoy. Had a man under that covenant transgressed any moral precept, he would of course have forfeited the favour of his God, and either been subjected to punishment or to a long course of repentance; but supposing the efficacy of repentance under the law of nature to be what they suppose it to be, he might before it was perfected have lost his existence by the eating of the forbidden fruit; and thus his penitence or punishment have ended in everlasting death. This can never be the issue of things under the new covenant, which, by the death of Christ, secures immortality to man, and gives to him opportunities, as long as he shall be in a state of probation, of recovering the divine favour when forfeited, whether by a moral transgression or a temporary violation of the peculiar condition of the covenant. Hence they admit the truth of the apostle's doctrine, that we are gainers by the fall of Adam and the redemption wrought by Christ; which will appear when we come to consider their notions of Christian justification. In the mean time it may be proper to observe, that they consider it as no small confirmation of their opinion, that it tends to put an end to the long agitated disputes concerning the *extent* of redemption, and to reconcile passages of scripture which, on the commonly received theories both of Calvinists and Arminians, seem to be at variance with each other.

It is well known to be one of the fundamental doctrines of the Calvinistic school, that "none are redeemed by Christ, effectually called, justified, adopted, sanctified, and saved, but the elect only †;" and if the notions of redemption, which, in the end of the last century, were very generally embraced, be admitted as just, it will not be easy to overturn the arguments by which that doctrine is supported. Such of them as are connected with the great question of election and reprobation, and enter into the decision of it, we have stated in another place (see *PREDESTINATION*, n^o 14); but it is farther argued ‡, that the doctrine of *universal* redemption reflects on the wisdom, the justice, and the power of God, and robs him of his glory.

The scriptures assure us that all men shall not be saved; but how can this be, if Christ died for all, and the scheme of salvation by his death was formed by infinite wisdom? The Arminians indeed say, that those who fail of salvation, fail through their own fault in not performing the conditions required of them; but God either *knew* or *knew not* that such men would not perform those conditions. If he knew it not, his knowledge is limited; if he did know it, where was his wisdom in providing a scheme of redemption for men to whom he was aware that it would be of no benefit? "God, we are told, is righteous in all his ways and holy in all his works;" but there is no righteousness in making Christ bear the sins of *all* men, and suffer the punish-

men due to them, if any one of those men shall be afterwards punished everlastingly. If Christ has already paid the debts of the whole world, it cannot be just to cast a single inhabitant of the world into the prison of hell, there to be detained till he shall again have paid the uttermost farthing. "The Lord's hand is not shortened that it cannot save;" for he is and always will be the same Almighty power that he was from eternity; but if by the divine decree Christ died for all men, and yet all men shall not be saved, it would appear that man is mightier than his Maker! The ultimate end of God in the redemption of man is admitted to have been his own glory; but if any individual of the human race, who was redeemed by Christ, shall not be saved, God will so far lose his end, and be deprived of his glory. For, if this were the case, where would be the glory of God the Father in forming a scheme which, with respect to multitudes, does not succeed? and where would be the glory of the Son of God, the Redeemer, in working out the redemption of men who are yet not to be saved by him? and where would be the glory of the spirit of God, if redemption were not by him effectually applied to every individual for whom it was wrought? By such arguments as these do the Calvinists oppose the scheme of universal redemption, and contend that Christ died only for the *elect*, or such as shall be placed on his right hand at the day of judgment. This notion of a limited redemption, as they think it more worthy of the sovereignty of God, they believe to be taught by our Saviour himself, when he saith *, "All that the Father *giveth* me shall come to me; and him that cometh to me, I will in nowise cast out. For I came down from heaven, not to do mine own will, but the will of him that sent me. And this is the Father's will who hath sent me, that of all which he hath *given* me I should lose nothing, but should raise it up again at the last day."

The Arminians, on the other hand, contend, that it is impious to limit the effects of Christ's death to a chosen few, since it appears from scripture, that by the decree and intention of his Father he tasted death for every man, and all without exception, might through him obtain remission of their sins. Thus our Lord himself told Nicodemus †, that "as Moses lifted up the serpent in the wilderness, even so must the Son of Man be lifted up; that *whosoever* believeth in him, should not perish, but have everlasting life. For God so loved the *world*, that he gave his only begotten Son, that whosoever believeth in him should not perish, but have everlasting life. For God sent not his Son into the world to condemn the world, but that the *world* through him might be saved." In perfect conformity with the doctrine of his divine Master, St Paul teaches ‡, that "Christ died for *all*;" that God was in Christ reconciling the *world* to himself, not imputing their trespasses unto them;" that "he will have *all* men to be saved, and to come unto the knowledge of the truth;" that "Christ gave himself a ransom for *all*;" and that "Jesus was made a little lower than the angels, that by the grace of God he should taste death for *every man*." The very same thing is taught by St Peter and St John, when the former says §, that "the Lord is not willing that *any* should perish, but that *all* should come to repentance;" and the latter ||, that "Jesus Christ the righteous is the propitiation for our sins; and not for our's only, but for *the whole world*."

Upon these texts, without any commentary, the Arminians are willing to rest their doctrine of universal redemption; though they think that a very strong additional argument for its truth arises from the numberless absurdities which flow from the contrary opinion. Thus, say they *, the apostles were commanded by our Saviour † to "go in to *all* the world and preach the gospel to *every creature*;" ‡ St Mark

Theology, more particularly Christian.

and all who hear it preached are required to believe it: but no man, as the Calvinists themselves confess, can believe the gospel as a Christian, without believing that Christ died for him; and therefore, if it be true that Christ died only for the elect, a great part of mankind are required to believe a lie, and a falsity is made the object of divine faith! Again, if Christ did not die for all, then no man can be sure that he is bound to believe in Christ when preached to him; nor can any man be justly condemned for infidelity: which is not only absurd in itself, but directly contrary to what we are taught by our blessed Lord, who assures us *, that unbelief is the cause of condemnation. Lastly, if Christ died not for all, then is it certain that he cannot claim dominion over all in consequence of his death and resurrection; but St Paul says expressly †, that "to this end Christ both died, and rose, and revived, that he might be the Lord both of the dead and living." The Arminians acknowledge, that though Christ died for all, there are many who will not be saved; for, say they ‡, the death of Christ did not literally pay the debts incurred by sinners, but only obtained for them the gracious covenant of the gospel, by which all who believe in him, and sincerely endeavour to work out their own salvation with fear and trembling, are entitled to forgiveness of sins and eternal life.

157 Difficulties removed by the modern Arminians.

Such is the state of this controversy as it was agitated between the Calvinists and Arminians of the last century; but the present leaders of this latter school are of opinion, that it never could have been started, had not both parties mistaken the purpose for which Christ died. It is not conceivable, say they, that any thing for which the eternal Son of God took upon him human nature, and in that nature suffered a cruel and ignominious death, shall not be fully accomplished; and therefore, if in the divine intention he died to make atonement for the sins of man actual as well as original, we must of necessity conclude that those for whom he died shall certainly be saved. Yet we learn from scripture that many shall go away into everlasting punishment, though the same scripture repeatedly assures us that Christ gave his life a ransom for all, and that he is the propitiation for the whole world. To reconcile these different passages of scripture is impossible, if we suppose that he laid down his life to atone for the actual transgressions of men; but if the direct purpose of the Godhead in forming this stupendous plan of redemption was, that the death of Christ should be the ransom of all from the grave or utter extinction, every difficulty is removed; for we know that all, the wicked as well as the righteous, shall through him be raised to life at the last day. That this was the purpose for which he died, they think apparent from the very words quoted by the Calvinists to prove that redemption was not universal; for he declares that it was his Father's will, "that of all which had been given him he should lose nothing," not that he should save it all from future punishment, but only that he "should raise it up at the last day." When St John calls him a propitiation for our sins, which, as we have seen, the divines whose doctrine we are now stating hold him to be indirectly, he does not add, as in our translation, for the sins of the whole world, but τῆς ἁλώτου του κόσμου, for the whole world, which, by his death, he redeemed from that vanity

and corruption under which, according to St Paul, it had groaned from the fall till the preaching of the gospel. Hence it is that our blessed Lord calls himself "the resurrection and the life," and always promises to those who should believe in him that though they were dead, yet should they live, and that he would raise them up at the last day.

Among these various opinions respecting the destination of the death of Christ, it belongs not to us to decide. The serious reader, divesting himself of prejudice in favour of the system in which he has been educated, will search the scriptures, and adopt the theory which he shall find most explicitly taught in that sacred volume; but as in every system it is admitted, that one purpose for which Christ died was to redeem mankind from the everlasting power of the grave, and bring to light life and immortality, it is of the utmost importance to know whether that purpose has been fully attained. Death we see still triumphing over all the generations of men; and as the scriptures give us no hopes of being rescued from its dominion but through the medium of a resurrection, some sensible evidence seems necessary to evince that a general resurrection shall actually take place. This we are promised as one great benefit purchased for us by the sufferings of Christ sacrificed on the cross. And since the price has been paid, and paid thus visibly, the nature of the covenant requires that the benefit should be as visibly enjoyed by the person whose sufferings obtained it for his brethren. "If the Redeemer himself had not been seen to enjoy the fruits of the redemption procured, what hopes could have remained for the rest of mankind? Would not the natural conclusion have been, that the expedient of redemption, by the death and sacrifice of Jesus, had proved ineffectual?" This is the conclusion which St Paul himself draws: "If Christ be not risen (says he *), then is our preaching vain, and your faith is also vain; ye are yet in your sins. Then they also, who are fallen asleep in Christ, are perished—ἀπώλοιο—are lost, as if they had never existed. But now (adds he) is Christ risen from the dead, and become the first fruits of them that slept. For since by man came death, by man came also the resurrection of the dead: For as in Adam all die, even so in Christ shall all be made alive."—So necessarily connected, in the opinion of the apostle, is the resurrection of Christ with the very essence of Christianity †.

Though we have in another place (see RESURRECTION, n° 50.) stated such arguments for the truth of this fundamental article of our common faith, as must carry conviction to every mind capable of estimating the force of evidence; yet as attempts are daily made, sometimes openly and sometimes with the most insidious art, to propagate in this nation the French doctrine concerning the eternal sleep of death (G), we trust that we shall not trespass on the serious reader's patience if we here resume the subject, and endeavour to show that it was absolutely impossible for the apostles to persuade the world, or to think of persuading the world, that their Master rose from the dead, if his resurrection was not real.

In the article MIRACLE *, we have said, that "the very resolution of the apostles to propagate the belief of false miracles in support of such a religion as that which is taught in

(G) Once we intended (see Vol. XVI. page 140. note A) to notice in this place some of the most recent of those attempts, and to expose them to that indignation with which, we trust, the good sense of our countrymen shall always treat such sophistical reasonings as have no other object than to diminish the sum of human happiness. On maturer reflection, however, it seems more expedient to state one decisive argument for the resurrection of Christ, which may be safely opposed to any new sophisms of our minute philosophers, when those which are at present in fashion shall have sunk through their own weakness into oblivion, or quietly retired with their authors to that place "Where Sinala dictates and Silenus lazes." Dunciad.

Theology, more peculiarly Christian.

in the New Testament, is itself as great a miracle as human imagination can easily conceive." We shall illustrate this position by the resurrection of Jesus, which we are to suppose the apostles resolving to publish as an unquestionable fact, whilst they were conscious that they themselves stole the body from the sepulchre, and saw it in their custody under the dominion of death. On such an enterprise they could not enter without much deliberation; and we may conceive him, to whom the thought of propagating this fable first occurred, addressing his companions in some such terms as the following:—

39
The Master whom we served is now no more, and the magnificent hopes which we had formed with respect to him and to ourselves are blasted by his death. The time which he fixed for his resurrection is passed; and it is folly to cherish any expectation of that event, as we see his body which we stole a prey to corruption. We must therefore either separate and return to our former professions, the obscurity of which will screen us from the disgrace of having been deceived; or, remaining united, take the generous resolution of supporting our glory, by saying to every body, that our Master is risen from the dead, and is the true Messiah expected by our nation, and foretold by the prophets. To return to our professions would be cowardly and mean; to propagate the story of the resurrection will be attended with infinite difficulty and danger; but to despise danger and to conquer difficulties, is worthy of great souls such as ours; and therefore I take it for granted that this is the part which you have all resolved to act.

40
To succeed in our glorious enterprise, it will be absolutely necessary to admit into our most secret counsels, not only the seventy disciples whom our Lord sent before him, in pairs, into every city and place which he visited*, but also that crowd of women† who followed him from Galilee, were present at his crucifixion, and visited his sepulchre; for all these persons are so intimately acquainted with every circumstance of his life and death, that they have it in their power completely to defeat our project in spite of our utmost art; and that power, it cannot be doubted, they will exert, unless admitted to share with us the glory of deceiving the world. The task which they and we have to perform is no ordinary one; for we must all speak the same things, and things which each of us knows to be false. Yet we must advance them with an air so intrepid as to remove suspicion, and be able to bury in profound secrecy the resolutions which in concert we take to-day.

41
No truth can be so deeply impressed upon our minds as that our Master continues under the dominion of death; and we all know that truth stands so ready at the door of the lips, that the greatest liar among us has hitherto uttered a thousand truths for one falsehood (H); but henceforth, on this most interesting subject, we must never let a single truth escape us either in our most unguarded moments or when put to the torture; for all will be lost, if any one person in whom we may place confidence shall reveal to our enemies what should be known to ourselves alone. It is therefore necessary to foresee all that is capable of extorting secrets from such persons as are not like us proof against every thing. We shall be exposed to much bad treatment, to prisons, to severe examinations, to death itself, and even to the most cruel and lingering kinds of death, sufficient to shake any but the most invincible resolutions. All this

should be foreseen, and must be despised by every person among us, men and women!

42
"But I must forewarn you, that under the greatest tortures we are not to hope for the smallest support from the testimony of a good conscience and the prospect of a future reward; for the very cruellest of our sufferings will arise from the remorse of conscience, unless we fortify ourselves against it by the most determined resolution. Others have indeed been wonderfully supported under violent and tedious sufferings, by the internal persuasion that they suffered for truth and righteousness sake; but as we are called upon to give new proofs of courage by suffering for what we know to be an impious falsehood, every reflection which tended to support them will torment us, and tempt us, in the most forcible manner, to betray our cause. From him, for whom we are to suffer and be sacrificed, we have nothing to expect; for since he could neither rescue himself from the violence of his enemies, nor fulfil his promise of rising from the dead, it would be madness to suppose that he will deliver us from our persecutors, or afford us the smallest consolation when sinking under the cruellest tortures which malicious ingenuity can invent. He was a deceiver, and has deceived us. He promised, a few hours before he was taken, that he would rise from the dead and go before us into Galilee; but God has ordered things otherwise; and as he is supreme Lord, we are not to sound his judgments, or even to think too much of them.

43
"You seem astonished at this counsel! It is new indeed, but necessary; and necessary to such a degree, that all our designs will prove abortive if we suffer the fear of God to get possession of our minds, and make us timid and pusillanimous in the testimony which we are determined to give against him, by maintaining that he raised from the dead a man whom he has without doubt condemned as an usurper of the glory which was not his due. Such assertions in favour of falsehood will no doubt cost us something in the beginning; but we must endeavour to make ourselves as easy as we can, by imprinting strongly on our minds how glorious and disinterested it will be to suffer without hope either from God or man, and even with the certainty of being punished both by God and man, not only in this life, but eternally in the next, if there be another. For let me not attempt to conceal from you, that present and future misery must be our inevitable portion; and that we must therefore become inaccessible to fear, even to such fear as religion itself ought to inspire, or return ignobly to our nets and boats; there is absolutely no other alternative. He whom we lament has not only assumed openly the character of the Messiah, but has dared even to call himself the Son of God; and though we have seen him ready to be stoned for these pretensions, and cannot doubt but that God was highly provoked at them, we must, in defiance of the divine vengeance, undertake to make them good, or at least cause him to be worshipped as the Son of God; whom to our own knowledge God has expressly disfavoured. This might frighten timid and vulgar souls; but we must have none such among us. All the men and women of our company must be capable of braving Omnipotence, and of deriving new vigour and resolution from the prospect of uninterrupted misery.

44
"Let us now consider how this great design is to be carried into execution; for it would be the excess of folly to enter upon

Luke —18.
Matth. i. 35.
St. Luke i. 35.
xxiv. 1 2.

(H) To the most illiterate fisherman of Galilee this must have been known as a fact; for no man can speak an intelligible sentence without uttering a truth or a falsehood, and surely every man speaks a thousand sentences for one in which he either utters or intends to utter a falsehood. How he must necessarily do so, we have shown in another place. See METAPHYSICS, n° 135, &c.

upon it without preparing the means of success. First of all, we will draw up together a list of the pretended appropriations of our common Master. Those who have the best inventions shall be employed in it; the rest of us shall revise and correct the work; and all must strongly imprint on their memories the pretended facts and discoveries which shall be agreed upon; because we must never think of retracting, and the least contradiction in our evidence would be of fatal consequence (1). To this labour we must join another, which requires more knowledge of the Scriptures than we possess; but we will supply our deficiencies by study. Our rulers, and indeed our countrymen in general, expect that the Messiah shall be a great and invincible hero; that he shall deliver his country from the dominion of the Romans; that he shall conquer all nations, and establish on earth an universal monarchy, of which Jerusalem is to be the capital. As such (they say) he is foretold by the prophets; but the person whom we mean to impose upon them as the Messiah, expressly disclaimed all worldly greatness, and made the sufferings of himself and his followers one test of the truth of his pretensions to the character which he assumed. Some of the most subtle among us therefore must carefully examine the books of Moses, the Psalms, and the Prophets, and wrest all the prophecies of the true Messiah in favour of him whom we know to be an impostor. The enterprise, as it is directly opposed, not only by truth, but also by all the prejudices and hopes of the nation, is indeed bold: but what is the whole of our design but the excess of boldness?

"We have hitherto believed that the religion of our forefathers is true, and was given by God to Moses. It is certainly the most ancient, the most authorized, the purest religion in the world; and the only one founded on divine revelation, or that boasts of such a foundation. But if we are to preach to the whole world, that our Master, whom we know to be an impostor, is the true and only Messiah; and if we are to apply to him prophecies which have another object, we must necessarily despise this most ancient religion, which our fathers and we have hitherto deemed divine and incontrovertible; and this is the ultimate point to which it has been my aim to bring you. I desire not that you should consent immediately, for to abandon one's religion is a thing which should not be done without maturely weighing the consequences; but what I desire is, that you will diligently compare all the parts of the plan which I have suggested to you, examine their strict and necessary union, and satisfy yourselves completely, that we must *adopt* the whole or *reject* the whole; for it is obvious that modifications and exceptions are here absolutely impossible.

"I hope you will not deliberate long on my proposal; for we shall have much to do after your resolution is formed, and the time in which I propose to concert and finish the whole scheme is very short. We have but the interval betwixt the present moment and the feast of Pentecost in which to prepare the order of false apparitions, and fix it in the memories of our numerous coadjutors, male and female; to study in the Scripture all that relates to the Messiah; to form the plan and adjust the parts of a new religion;

(1) Deistical writers have laboured strenuously, though in vain, to find such contradictions in the different accounts of the circumstances attending the resurrection as may discredit the evidence of the evangelists to the principal fact.—This gave occasion to Mr West's admirable *Observations on the Resurrection*; and were there any candour or modesty among our minute philosophers, the appearance of that book would have silenced them for ever. This, however, it has not done. The old cavils have, without the least notice of Mr West, been again brought forward by Thomas Paine, and again obviated by the Bishop of Landaff in his masterly *Apology for the Bible*. "If the writers of the Gospels (says Paine) had gone into any court of justice to prove an *alibi* (for it is of the nature of an *alibi* that is here attempted to be proved, namely, the absence of a dead body by supernatural means), and had given their evidence in the same contradictory manner as it is here given, they would have been in danger of having their ears cropt for perjury, and would have justly deserved it." In reply to this impious sarcasm, the right reverend apologist thus addresses its author: "As we cannot have this *viva voce* examination of all the witnesses, let us call up and question the evangelists as witnesses to a supernatural *alibi*.—Did you find the sepulchre of Jesus empty? One of us actually saw it empty, and the rest heard from eye-witnesses that it was empty.—Did you, or any of the followers of Jesus, take away the dead body from the sepulchre? All answer, No.—Did the soldiers, or the Jews, take away the body? No.—How are you certain of that? Because we saw the body when it was dead, and we saw it afterwards when it was alive.—How do you know that what you saw was the body of Jesus? We had been long and intimately acquainted with Jesus, and knew his person perfectly.—Were you not affrighted, and mistook a spirit for a body? No; the body had flesh and bones; we are sure that it was the very body which hung upon the cross, for we saw the wound in the side, and the print of the nails in the hands and feet.—And all this you are ready to swear? We are; and we are ready to die also, sooner than we will deny any part of it.—This is the testimony which all the evangelists would give, in whatever court of justice they were examined; and this, I apprehend, would sufficiently establish the *alibi* of the dead body from the sepulchre by supernatural means."

"The book of Matthew (says Paine) continues its account, that at the end of the Sabbath, as it began to dawn, towards the first day of the week, came *Mary Magdalene* and the other *Mary* to see the sepulchre. Mark says it was sun-rising, and John says it was dark. Luke says it was *Mary Magdalene*, and *Joanna*, and *Mary the mother of James*, and other women, that came to the sepulchre. And John says that *Mary Magdalene* came alone. So well do they agree about their first evidence! they all appear, however, to have known most about *Mary Magdalene*; she was a woman of a large acquaintance; and it was not an ill conjecture that she might be upon the stroll."

"This (replies the Bishop) is a long paragraph, and I will answer it distinctly: First, There is no disagreement of evidence with respect to the time when the women went to the sepulchre; all the evangelists agree as to the day on which they went; and as to the time of the day, it was early in the morning: what court of justice in the world would set aside this evidence as insufficient to substantiate the act of the women having gone to the sepulchre, because the witnesses differed as to the degree of twilight which lighted them on their way? Secondly, There is no disagreement of evidence with respect to the persons who went to the sepulchre. John states that *Mary Magdalene* went to the sepulchre; but he does not state, as you make him state, that *Mary Magdalene* went alone; she might, for any thing you have proved or can prove to the contrary, have been accompanied by all the women mentioned by Luke. Is it an unusual thing to distinguish by name a principal person going on a visit or an embassy, without mentioning his subordinate attendants?

liarly Chri-
stian.

gion; to efface in our mind all traces and ideas of the ancient one; and to fortify ourselves against our prejudices, our fears, and our worldly interests: for we must get quit of all these, since we are going most generously to renounce all the goods of this life, and all the hopes of the next.— What makes me choose the feast of Pentecost for our first public appearance in our new capacity, is the great concourse of people from all nations which will be then at Jerusalem; for it will be a favourable opportunity to preach to them the resurrection of him whom our rulers have crucified, and by their means to spread the news quickly over the whole world. We are ignorant indeed of foreign tongues, and we are without interpreters; but our pretence will suffice. Some will comprehend by signs what we would say to them, and others, who hear and understand our language, will assist them. We cannot, it is true, work a miracle; but was there ever such a miracle thought of as our daring to resist all that is mighty and respectable in our nation? There would perhaps be more prudence in not appearing altogether; and as we have nothing extraordinary or divine to command respect, nor any protection to hope from God or man, in not exposing ourselves in a body on the first day of our enterprise; but in a design like ours, singular in its whole nature, and contrary to common rules, of what use would prudence be? I am sure that with our Galilean pronunciation, and with the goodly appearance that we shall make in our fishermen's garments, we shall persuade a multitude of people. Nay, so confident am I of our success, that I include in my design not only Judea but all the nations upon earth. Nor shall I be discouraged by the diversity of religions, manners, and tongues, which prevail in the world; be affrighted by the hostile power of all mankind; or have my zeal in the least abated for him who hath deceived us, by the improbability of being able to make the Gentiles, who know nothing of the Scriptures or the Messiah, adore as the Son of God the man whom the Jews have crucified as an impostor.

“ In the mean time, it will be proper to accustom ourselves to the most inhuman spectacles, in order to arrive by degrees at such a hardness of heart as nothing can be sup-

posed to move. You may depend upon it, that we shall see multitudes of people, seduced by our discourses, proscribed, banished, thrown into dark prisons, torn in pieces by engines of torture, condemned to wild beasts, to the fire, and to the most shameful and insupportable punishments, for preaching with us the resurrection of Jesus.— Now, as we are all by nature inclined to compassion, we might be tempted to relieve them from such exquisite misery, since we could effectually do it by a single word; but this word, which would discover the whole mystery, must never slip from our mouths. There must not be so much as one sigh or one groan to betray us. Instead of unseasonably reproaching ourselves with our imposture by which we deceived them, we must applaud ourselves for their seduction; we must place our own joy in their wretchedness; and we must not be afraid to honour, and cause them to be honoured, as illustrious witnesses of the truth, though we know them to be only martyrs to our hypocrisy, and to their own facility in believing falsehood *.”

This is a faithful view of the outlines of that plan which must have been formed by the apostles, if they intended to deceive the world with respect to the resurrection of their Master. It is of no consequence to the argument whether it grow gradually out of the joint deliberations of the whole body, or was completely digested, as we have supposed, by one of the number, and implicitly adopted by the rest: it is enough that every circumstance which we have mentioned must have occurred to them, and that every resolution must have been unanimously adopted which we have made to flow from the mouth of this daring orator. But surely the bare recital of such an oration is sufficient to show the impossibility of carrying into effect so absurd, so horrible, and so impious a measure—a measure diametrically opposite to all the principles and motives of human actions.

Archbishop King has supposed **, that the human will is a faculty distinct from the understanding and the appetites; that activity is essential to it; and that previous to an election formed, it is equally indifferent to all objects. He thence infers, that a man may choose, and even take delight in, a what is not naturally agreeable to any of his appetites; be-

* See the Principles of the Christian Religion translated by Mr Lally.

** Origin of Evil, 316 edit. ch. 5. sect. 1. 1. 1. 3. and caust.

dants? Thirdly. In opposition to your insinuation, that Mary Magdalene was a common woman, I wish it to be considered whether there is any scriptural authority for that imputation; and whether there be or not, I must contend, that a repentant and reformed woman ought not to be esteemed an improper witness of a fact. The conjecture which you adopt concerning her is nothing less than an illiberal, indecent, unfounded calumny, not excusable in the mouth of a libertine, and intolerable in yours.

“ The book of Matthew (continues Paine) goes on to say: ‘ And behold there was an earthquake, for the angel of the Lord descended from heaven, and came and rolled back the stone from the door, and sat upon it;—but the other books say nothing about any earthquake.’—What then? does their silence prove that there was none?—‘ Nor about the angel rolling back the stone and sitting upon it.’—What then? does their silence prove that the stone was not rolled back by an angel, and that he did not sit upon it?—‘ And according to their accounts there was no angel sitting there.’—I his conclusion (says his Lordship) I must deny; their accounts do not say there was no angel sitting there at the time that Matthew says he sat upon the stone. They do not deny the fact, they simply omit the mention of it; and they all take notice that the women, when they arrived at the sepulchre, found the stone rolled away: hence it is evident that the stone was rolled away before the women arrived at the sepulchre; and the other evangelists, giving an account of what happened to the women when they reached the sepulchre, have merely omitted giving an account of a transaction previous to their arrival. Where is the contradiction? What space of time intervened between the rolling away the stone and the arrival of the women at the sepulchre, is nowhere mentioned; but it certainly was long enough for the angel to have changed his position; from sitting on the outside he might have entered into the sepulchre; and another angel might have made his appearance, or, from the first, there might have been two. one on the outside rolling away the stone, and the other within. Luke, you tell us, ‘ says there were two, and they were both standing; and John says there were two, and both sitting.’—It is impossible, I grant, even for an angel to be sitting and standing at the same instant of time; but Luke and John do not speak of the same instant, nor of the same appearance.—Luke speaks of the appearance to all the women; and John of the appearance to Mary Magdalene alone, who turned weeping at the sepulchre after Peter and John had left it. But I forbear making any more minute remarks on still minuter objections, all of which are grounded on this mistake—that the angels were seen at one particular time, in one particular place, and by the same individuals.”

case when the choice is made, a relation is formed between the will and the object of choice, which, from being originally indifferent, now becomes a favourite object. But neither his Grace, nor any other asserter of human liberty, has ever affirmed or supposed, that any man or body of men could deliberately choose evil for its own sake, or enter zealously upon a tedious and difficult enterprise, from which no good could possibly arise, and from which unmixed misery was clearly to be seen as the necessary result of every step of the progress. Such, however, must have been the choice and the conduct of the apostles, when they resolved to preach a new religion founded on the resurrection of Jesus, if they did not certainly know that Jesus had risen from the dead. And this conduct must have been adopted, and in opposition to every motive which can influence the human mind; have been persevered in by a great number of men and women, without the smallest contradiction having ever appeared in the various testimonies, which at different times, and under the cruellest tortures, they all gave to a variety of circumstances, of which not one had its foundation in truth. He who can admit this supposition, will not surely object to the incredibility of miracles. The resurrection of a man from the dead is an event so different indeed from the common course of things, that nothing but the most complete evidence can make it an object of rational belief; but as the resurrection of Jesus has always been said to have had God for its Author, it is an effect which does not exceed the power of the cause assigned, and is therefore an event possible in itself and capable of proof. It is a deviation from the laws of nature, but it is not contradictory to any one of those laws.

That a great number of men and women should deliberately form a plan of ruin and misery to themselves, without a prospect of the smallest advantage either in this world or in the next, is as different from the common course of things as the resurrection from the dead; and therefore in itself at least as great a miracle: but that they should persist in prosecuting this plan in the midst of torments; that they should spread themselves over the whole world, and everywhere publish a number of falsehoods, without any one of them contradicting the rest; that truth should never escape them either in an unguarded moment, or when lingering on the rack, and yet that all their lies should be in perfect agreement with each other; that they should every one of them court sufferings for a person whom they knew to be an impostor; that not one of the number—not even a single woman—should have to much compassion for a fellow-creature, as to rescue him from the flames by confessing a truth which could injure nobody—not even the suffering deceivers themselves:—all this is not only different from the common course of things, but directly contrary to the most known laws of nature, and is therefore not miraculous, but may be pronounced impossible. Yet this impossibility we must admit, or acknowledge, that as “Christ died for our sins, according to the Scriptures, and was buried; so he rose again the third day according to the Scriptures; that he was seen of Cephas, then of the twelve; after that of above five hundred brethren at once; after that of James; then of all the apostles; and that he was last of all seen of St Paul.” who was converted by the vision to preach the faith which till then he had persecuted.

Thus are we assured, that “those who have fallen asleep in Christ are not lost, since he is risen from the dead, and become the first fruits of them that slept. For since by man came death, by man came also the resurrection of the dead. For as in Adam all die, even so in Christ shall all be made alive. But every man in his own order: Christ the first-fruits, afterwards they that are Christ’s at his coming; for

all that are in the graves shall hear his voice, and shall come forth; they that have done good unto the resurrection of life, and they that have done evil to the resurrection of damnation.”

Our blessed Lord having conversed familiarly with the eleven apostles for forty days after his resurrection, instructing them in the things pertaining to the kingdom of God; having extended their authority as his ministers, by giving them a commission to teach all nations, and make them his disciples, by baptizing them in the name of the Father, and of the Son, and of the Holy Ghost; and having promised them power from on high to enable them to discharge the duties of so laborious an office—led them out as far as Bethany, that they might be witnesses of his ascension into heaven. “When they therefore were come together, they asked of him, saying, Lord, wilt thou at this time restore again the kingdom to Israel? And he said, it is not for you to know the times and the seasons, which the Father hath put in his own power. But ye shall receive power after that the Holy Ghost is come upon you; and ye shall be witnesses unto me, both in Jerusalem, and in all Judæa, and in Samaria, and unto the uttermost parts of the earth. But tarry ye in the city of Jerusalem, until ye be endued with power from on high; and he lit up his hands and blessed them; and it came to pass while he blessed them, he was parted from them, and a cloud received him out of their sight. And while they looked stedfastly towards heaven, as he went up, behold, two men stood by them in white apparel; who also said, ye men of Galilee, why stand ye gazing up into heaven? This same Jesus, who is taken up from you into heaven, shall so come, in like manner as ye have seen him go into heaven. And they worshipped him, and returned to Jerusalem with great joy.”

That our blessed Lord ascended into heaven, will hardly be denied in the present age by any one who admits that he rose from the dead. The ascension was indeed the natural consequence of the resurrection; for we cannot suppose that a man would be called back from the grave to live for ever in a world where all other men fall in succession a prey to death. The purpose for which he died was to recover for the descendants of Adam every privilege which they had forfeited through his transgression; and if, as has been generally believed, mankind were by the terms of the first covenant to enjoy eternal life in heaven, some proof was necessary that Christ by his death and resurrection had opened the kingdom of heaven to all faithful observers of the terms of the second. Hence it was prophesied of the Messiah, in whom all the nations of the earth were to be blessed, that “he should ascend on high, lead captivity captive, and sit on the right hand of God until his enemies should be made his footstool.” It was therefore of the greatest importance to the apostles to have sufficient proof of their Master’s exaltation to the right hand of the Majesty on high; for otherwise they could neither have looked for an entrance into heaven themselves, by a new and living way, as the author of the epistle to the Hebrews expresses it, nor have preached Jesus as the Messiah promised to their fathers, since they could not have known that in him these prophecies were fulfilled. But the proof vouchsafed them was the most complete that the nature of the thing would bear. The spectators of the ascension were many; for, according to the history of St Luke*, those who returned from the Mount of Olives to Jerusalem, and prepared themselves for the coming of the Holy Ghost, were in number about six score; and to such a cloud of witnesses the evangelist would not have appealed, had not the fact he was recording been very generally known. Yet these were perhaps but part of the witnesses; for since Christ had told to his disciples that he was to ascend

ascend

send to his Father and their Father, to his God and their God, and that he was going to prepare a place for them, that where he is there they might be likewise; we can hardly doubt but that all who believed in him as the Redeemer of the world would take care to be present, not only to view their Master's triumph over all his enemies, but also to have a sight of that glory which awaited themselves. It was on this occasion probably that he was seen after his resurrection by above five hundred brethren at once, of whom the greater part were alive at the writing of St Paul's first epistle to the Corinthians.

But though such multitudes of people saw Jesus lifted up from the mount, and gradually vanish out of their sight, some other evidence seemed necessary to certify them of the place to which he had gone. Two angels therefore appear, and attest what human eyes could not see, but what was indeed the consequence of what they had seen. They attest that Christ had ascended to heaven, not to descend again till the last day; and surely, with respect to this point, the citizens of heaven were the most unexceptionable witnesses. We must therefore acknowledge and confess, against all the wild heresies of old (κ), that Jesus Christ the Son of God, who died and rose again, did with the same body and soul with which he had lived upon earth ascend up "into heaven, there to appear in the presence of God for us *." Having in the outward tabernacle of this world once offered up himself a pure and perfect sacrifice for the expiation of our sins, he entered within the veil into the most holy place, there to present his blood before God himself, in order to obtain mercy for us, and restore us to the Divine favour. So that, "if any man sin, we have an advocate with the Father, Jesus Christ the righteous, who is the propitiation for our sins, and not for ours only, but also for the sins of the whole world; and he is able to save to the uttermost those that come to God by him, seeing he ever liveth to make intercession for us." "Seeing then that we have a great high-priest, who is passed into the heavens, Jesus the Son of God, we may through him come boldly unto the throne of grace, that we may obtain mercy, and find grace to help in time of need."

But it is not the office of a priest only that our Lord discharges in heaven; he is represented as sitting on the right hand of God, to denote that regal authority with which he is now vested; "angels, and authorities, and powers, being made subject to him †." Hence it is, that after his resurrection, he said of himself †, "all power is given unto me in heaven and in earth;" for, as St Paul informs us ‡, "because he humbled himself and became obedient unto death, even the death of the cross, therefore God hath highly exalted him, and given him a name which is above every name; that at the name of Jesus every knee should bow, of things in heaven, and things in earth, and things under the earth." And this submission is due to him, because "God raised him from the dead, and set him at his own right hand in the heavenly places, far above all principalities and powers, and might, and dominion, and every name that is named, not only in this world, but also in that which is to come; and hath put all things under his feet, and gave him to be head over all things to the

church *." As God, Christ possessed a kingdom, which, as it had not a beginning, can never have an end: but the dominion, of which the apostle is here treating, was conferred upon him as the mediator of the new covenant, and will no longer continue than till his enemies shall be subdued; for we are told, that "he must reign till he hath put all enemies under his feet; and that the last enemy which shall be destroyed is death." "He will ransom his subjects from the power of the grave; he will redeem them from death. O death, he will be thy plague; O grave, he will be thy destruction †." The trumpet shall sound, the graves shall be opened, all the sons and daughters of Adam shall return to life, and death shall be swallowed up in victory. "Then cometh the end, when the office of mediator ceasing, he shall have delivered up the kingdom to God, even the Father, when he shall have put down all rule and all authority and power. For when all things shall be subdued unto him, then shall the Son also himself be subject unto him that put all things under him, that God may be all in all ‡."

The first conspicuous proof which our blessed Lord gave of being vested with supreme power, and made head over all things to the church, was on the day of Pentecost. He had told the apostles that he would pray the Father to give them another comforter, who should abide with them for ever, even the Spirit of truth, which should teach them all things, and bring all things to their remembrance which he had said unto them. He had assured them, that it was expedient for them that he himself should go away; "for if I go not away (said he †), the Comforter will not come unto you; but if I depart, I will send him unto you." At his last interview with them, just before his ascension, he had desired them to tarry at Jerusalem till they should be endued with power from on high, before they entered upon their great work of converting the nations. These promises were amply fulfilled; for "when the day of Pentecost was fully come, they were all with one accord in one place. And suddenly there came a sound from heaven as of a rushing mighty wind, and it filled all the house where they were sitting. And there appeared unto them cloven tongues, like as of fire, and it sat upon each of them. And they were all filled with the Holy Ghost, and began to speak with other tongues, as the Spirit gave them utterance. And there were dwelling at Jerusalem Jews, devout men, out of every nation under heaven. Now when this was noised abroad, the multitude came together, and were confounded, because that every man heard them speak in his own language. And they were all amazed, and marvelled, saying one to another, Behold, are not all these who speak Galileans? And how hear we every man in our own tongue, wherein we were born? Parthians, and Medes, and Elanites, and the dwellers in Mesopotamia, and in Judea, and Cappadocia, in Pontus and Asia, Phrygia and Pamphylia, in Egypt and in the parts of Libya about Cyrene, and strangers of Rome, Jews and proselytes, Cretes and Arabians—we do hear them speak in our tongues the wonderful works of God. And they were all amazed, and were in doubt, saying one to another, What meaneth this *?"

That those who heard the apostles speak so many dif-

(κ) There was one Apelles in the primitive church, who was condemned as a heretic for teaching that Christ's body was dissolved in the air, and that he ascended to heaven without it. The opinions of this man and his followers are stated at large and confuted by Tertullian, Gregory Nazianzen, and Epiphanius; and the reader who thinks such ridiculous notions worthy of his notice, will find enough said of them in the Notes to the sixth article of Pearson's Exposition of the Creed. Perhaps it may be from a hint communicated in these Notes, that our great modern corrector of the evangelists has discovered, if it be indeed true that he pretends to have discovered, that Jesus Christ is still upon earth.

Theology, more peculiarly Christian.
Early Christian.
Certainty of that miracle.

ferent languages were amazed, is what we should naturally suppose; but that a single individual among them remained unconvinced, is astonishing: for the gift of tongues on the day of Pentecost is one of the most palpable miracles that was ever wrought. It is likewise one of the best authenticated miracles; for the book entitled *the Acts of the Apostles* was written not more than 30 years after the event took place (see *SCRIPTURE*, n^o 168.); and it is not conceivable that, within so short a period, St Luke, or any man of common sense, would have appealed for the truth of what he recorded to so many inveterate enemies of the Christian name, had he not been aware that the miraculous gift of tongues was a fact incontrovertible. We all know how desirous the Jewish rulers were to stop the progress of the faith, by whatever means, whether of fraud or force; but if this miracle was not really performed, they had now an opportunity of doing it effectually by means to which truth and honour would give their approbation. Thousands must have been alive in the city of Jerusalem who were men and women at the time when the apostles were said to have been thus suddenly inspired with the tongues of the Parthians, Medes, and Elanites, &c.; and as these foreigners were themselves either Jews by descent, or at least proselytes to the Jewish religion, surely the chief priests would have found multitudes ready, both at home and abroad, to contradict this confident appeal of St Luke's, if contradiction had been possible. We read however of no objection whatever being made to this miracle. Some of the audience, indeed, when the apostles addressed people of so many nations in all their respective languages, not understanding what was said, and taking it for jargon which had no meaning, concluded, not unaturally, that the speakers were full of new wine, and mocked them for being drunk so early in the day; but this is a circumstance which, so far from rendering the miracle doubtful, adds much to the credit of the historian, as it would hardly have occurred to the writer of a narrative wholly false, and would certainly not have been mentioned, had he known that the apostles really attempted to impose upon the multitude unmeaning sounds for foreign languages.

196
The gift of tongues permanent with the apostles.

As it is thus certain that the apostles were miraculously furnished with the gift of tongues, so the elegance and propriety of that miracle to attest the real descent of the Spirit of truth, who was to teach them all things, and endue them with power from on high to convert the nations, can never be enough admired by the pious Christian; for words being the vehicle of knowledge, an ability to speak the different languages of the earth was absolutely necessary to enable those who had been originally fishermen to go into all the world and preach the gospel to every creature. Yet there have been writers †, who, though unable to call in question the reality of the gift of tongues on the day of Pentecost, have contended, that it was a gift "not lasting, but instantaneous and transitory; not bestowed upon them for the constant work of the ministry, but as an occasional sign only, that the person endowed with it was a chosen minister of the gospel; which sign, according to them, ceased and totally vanished as soon as it had served that particular purpose." The chief argument upon which this opinion is attempted to be built, is drawn from the scripture Greek, which is said to be "utterly rude and barbarous, and abounding with every fault which can possibly deform a language; whereas we should naturally expect to find an inspired language pure, clear, noble, and affecting, even beyond the force of common speech; since nothing can come from God but what is perfect in its kind. In short, we should expect, says the objector, the purity of Plato and the eloquence of Cicero *."

† Dr Middleton and Lord Shaftesbury.

197
Objections * Middleton's Essay on the Gift of Tongues.

In reply to this objection, it has been well observed †, that it supposes what is called the purity, elegance, and sublimity, of language, to be something natural and essential to human speech, and inherent in the constitution of things. "But the matter is far otherwise. These qualities are accidental and arbitrary, and depend on custom and fashion; modes of humanity as various as the differing climates of the earth; and as inconstant as the tempers, genius, and circumstances, of its inhabitants. For what is *purity*, but the use of such terms and their combinations as the caprice of a writer or speaker of authority hath preferred to their equals? what is *elegance*, but such a turn of idiom as a fashionable fancy hath brought into credit? and what is *sublimity*, but the application of such images as arbitrary and casual connections, rather than their own native grandeur, have dignified and ennobled? The consequence of this is, that the mode of composition which is a model of perfection to one nation or people, has always appeared either extravagant or mean to another. Asiatic and Indian eloquence was esteemed hyperbolical and unnatural by the Greeks and Romans, and is so esteemed by us; whilst the Greek and Roman eloquence in its turn appeared cold and insipid to the warm inhabitants of the east; and ours would appear perhaps still colder. But the New Testament was designed for the rule of life to all mankind. Such a rule required inspiration; and inspiration, say the objectors, implies the most perfect eloquence. What human model then was the Holy Ghost to follow? for a human model it must have been, because there was no other; and if there had, no other would have answered the purpose, which was to make a due impression on the mind and affections. Should the eastern eloquence have been employed? But it would have been too swelling and animated for the west. Should the western? This would have been too still and inactive for the east. Or suppose us only solicitous for what we best understand; which species of this latter genus should the sacred writers have preferred? The dissolute softness of the Asiatic Greeks, or the dry conciseness of the Spartans? The flowing exuberances of Attic eloquence, or the grave severity of the Roman?

† Warburton's Doctrine of Grace. 198 Answered.

"But are there not some general principles of eloquence in common to all the species? I here are. Why then should not these have been employed to credit the apostolic inspiration? Because the end even of these (replies our author) is to mislead reason, and inflame the passions; which being abhorrent to the truth and purity of our holy religion, were very fitly rejected by the inspired penman. Besides, it might easily be known to have been the purpose of Providence, though such purpose had not been expressly declared, that the gospel should bear all possible marks of its divine original, as well in the course of its progress as in the circumstances of its promulgation. To this end, the human instruments of its conveyance were mean and illiterate, and chosen from among the lowest of the people, that when the world saw itself converted by the *foolishness of preaching*, as the only learned apostle thinks fit to call it; unbelievers might have no pretence to ascribe its success to the parts, or stations, or authority, of the preachers. Now had the language inspired into these illiterate men been the eloquence of Plato or Tully, Providence would have appeared to counteract its own measures, and to defeat the purpose best calculated to advance its glory. But God is wise, though man is a fool. The course of Providence was uniform and constant: It not only chose the weakest instruments, but carefully kept out of their hands that powerful weapon of words which their adversaries might so easily have wrested to the dishonour of the gospel. Common sense tells us, that the style of an universal law should re-

tain what is common to all languages, and neglect what is peculiar to each. It should retain nothing but CLEARNESS and PRECISION, by which the mind and sentiments of the writer are intelligibly conveyed to the reader. This quality is essential, invariably the same, and independent of custom and fashion. It is the consequence of syntax, the very thing in language which is least positive, as being formed on the principles of philosophy and logic: whereas all besides, from the very power of the elements and signification of the terms to the tropes and figures in composition, are arbitrary; and, as deviating from these principles, frequently vicious. But this quality of clearness and precision eminently distinguishes the writings of the New Testament; inasmuch that it may be easily shown, that whatever difficulties occur in the sacred books do not arise from any imperfect information caused by this local or nominal barbarity of style; but either from the sublime or obscure nature of the things treated of, or from the intentional conciseness of the writers; who, in the casual mention of any thing not essential to the dispensation, always observe a studied brevity."

After much ingenious and sound reasoning on the nature of language in general, our author concludes, that the style of the New Testament, even on the supposition of the truth of what has been said to its discredit, is so far from proving the language not to be divinely inspired, that it bears one certain mark of that original. "Every language consists of two distinct parts, the single terms, and the phrases and idioms. Suppose now a foreign language to be instantaneously introduced into the minds of illiterate men like the apostles; the impression must be made either by fixing in the memory the terms and single words only with their signification, as, for instance, Greek words corresponding to such or such Syriac or Hebrew words; or else, together with that simple impression, by enriching the mind with all the phrases and idioms of the language so inspired. But to enrich the mind with the peculiar phrases and idiom of a foreign language, would require a previous impression to be made of the manners, notions, fashions, and opinions, of the people to whom that language is native; because the idiom and phrases arise from and are dependent on these manners. But this would be a waste of miracles without sufficient cause or occasion; for the Syriac or Hebrew idiom, to which the Jews were of themselves enabled to adapt the Greek or any other words, abundantly served the useful purposes of the gift of tongues, which all centered in those tongues, being so spoken and written as to be CLEARLY UNDERSTOOD. Hence it follows, that if the style of the New Testament were indeed derived from that language which was miraculously impressed upon the apostles on the day of Pentecost, it must be just such a one as in reality we find it to be; that is, it must consist of Greek words in the Syriac or Hebrew idiom."

The immediate author of this gift, so necessary to the propagation of the gospel, was the Spirit of truth, or the Comforter, who is the Holy Ghost and the third person in the blessed Trinity. That there are three persons in the one Godhead, has been shewn at large in a former section of this article; and that the Holy Ghost is one of these three, might be safely concluded from the form of baptism instituted by Christ himself. But as more plausible objections have been urged against his divinity than any that we have met with against the divinity of Christ, it may not be improper to consider these before we proceed to give an account of the graces which he imparted to the infant church, and of the apostles preaching under his influence. By the Arians the Holy Ghost is considered as a creature; by the Socinians and modern Unitarians, as they call themselves, the words *Holy Ghost* are supposed to express, not a

person or spiritual subsistence, but merely an energy or operation, a quality or power, of the Father, whom alone they acknowledge to be God. If this doctrine can be confuted, the Arian hypothesis will fall to the ground of itself; for it is not conceivable that any inspired teacher should command his followers to be baptized in the name of the self-existent God and two creatures.

It is admitted by the Socinians themselves, that in the scriptures many things are spoken of the Holy Ghost which can be properly predicated only of a person; but the inference drawn from this concession they endeavour to invalidate by observing, that in scripture there are likewise expressions in which things are predicated of abstract virtues, which can be literally true only of such persons as practise these virtues. Thus when St Paul says, that "charity suffereth long and is kind, charity envieth not, charity vaunteth not itself, is not puffed up, &c." we cannot suppose his meaning to be, that these actions are performed by charity in the abstract, but that every charitable person, in consequence of that one Christian grace, suffereth long and is kind, envieth not, vaunteth not himself, and is not puffed up, &c. In like manner, say they, personal actions are attributed to the Holy Ghost, which itself is no person, but only the virtue, power, or efficacy, of God the Father; because God the Father, who is a person, performs such actions by that power, virtue, or efficacy, in himself, which is denominated the Holy Ghost. Thus when we read that "the Spirit said unto Peter, Behold three men seek thee; arise therefore and get thee down, and go with them, doubting nothing, for I have sent them;" we must understand that God the Father was the person who spoke these words and sent the three men; but because he did so by that virtue in him which is called the Spirit, therefore the Spirit is said to have spoken the words and sent the men. Again, when "the Holy Ghost said to those at Antioch, Separate me Barnabas and Saul for the work where I have called them;" we are to conceive that it was God the Father who commanded the two apostles to be separated for the work to which he had called them; but because he had done all this by that power within him which is called the Holy Ghost, therefore his words and actions are attributed to the Holy Ghost, just as long-suffering in men is attributed to charity.

This reasoning has a plausible appearance, and would be of much force were all the actions which in scripture are attributed to the Holy Ghost of such a nature as that they could be supposed to have proceeded from the person of God the Father in consequence of any particular power or virtue in him; but this is far from being the case. Thus "the Spirit is said to make intercession for us;" but with whom can we suppose God the Father, the fountain of divinity, to intercede? Our Saviour assured his disciples that the Father would, in his name, send to them the Holy Ghost, who is the Comforter; that he would himself send the Comforter unto them from the Father; that the Comforter should not speak of himself, but speak only what he should hear; and that he should receive of Christ's, and shew it unto them. But we cannot, without blasphemy and absurdity, suppose that the Father would, in the name of Christ, send himself; that the Son would send the Father from the Father; that the Father would not speak of himself, but speak only what he heard; or that either the Father in person, or a quality of the Father, should receive any thing of Christ to shew unto the apostles.

The sagacity of Socinus perceived the force of such objections as these to his notion of the Holy Ghost, being nothing more than the power of the Father personified; and therefore he invented another *profopoeia* to serve his purpose

199 Divinity of the Holy Ghost.

The purpose in the interpretation of those texts to which this one cannot be applied. "The Spirit of God (says he) may be considered either as a property or power in God, or as the things on which that power is working. When taken in the former sense, the Spirit, where any personal attribute is given to it, means God the Father; when taken in the latter sense, it means the man on whom the power of the Father is working; who, as long as he is affected by that power, is therefore called the Spirit of God;" and he quotes, we think most absurdly, the tenth verse of the second chapter of the first epistle to the Corinthians, as a text in which by the Spirit is meant an inspired man who could search all things, yea, even THE DEEP THINGS OF GOD.

§ *Faug.*
Socius in
Ep. ad
Wickam,
(29, 10.

How his modern followers, who deny the plenary inspiration even of Christ, will relish such a degree of inspiration as this, which raises mere man to a temporary equality with God, we know not; but leaving them to settle the dispute with their master as they best can, we shall produce one or two passages in which personal attributes are given to the Spirit of God, when it is impossible to conceive that Spirit either as a power inherent in the Divine Father, or as the person on whom that power is operating. We need not bring new texts into view, as some of those already quoted will serve our purpose. When our Saviour promises that the *Holy Ghost, the Comforter, the Spirit of truth,* should be sent by the Father and the Son to the apostles, we have seen, that by this Spirit he could not mean the Father or a property of the Father; neither could he possibly mean the apostles themselves, unless we are to suppose that the Father and the Son sent St Peter to St Peter, and that St Peter, so sent, came to St Peter! Again, when Christ saith of the Holy Ghost, "he shall receive of mine, and shall shew it unto you," he could not, for the reason already assigned, mean by the Holy Ghost the Father or the power of the Father; and surely his meaning was not, that the apostles, under the influence of the power of the Father, should receive something and shew it each to himself! The Holy Ghost therefore is unquestionably a person; for tho' there are many passages of scripture in which the *gifts* of the Holy Ghost are called the *Holy Ghost*, they are so called by a very common figure of speech, in which the effect receives the name of its cause: and since this person is joined with the Father and the Son in the formula of Christian baptism; since they who lied to the Holy Ghost are said to have lied unto God; since blasphemy against him is a more heinous offence than the same sin against even the Father or the Son; and since it was by the operation of the Holy Ghost that Jesus Christ was conceived of the Virgin Mary, and even on that account called the Son of God—it follows undeniably, that the Holy Ghost is God, of the same substance with the Father and Son.

It was this divine Spirit which, on the day of Pentecost, inspired the apostles with the knowledge of different languages; and as these were given only to enable them to preach the gospel to every creature, it can admit of no

doubt but that he, who so amply provided the means of preaching, would take care that the gospel should be preached in purity. Our Saviour had told his apostles that the Comforter would guide them into all the truth (*ὅτι πᾶσαν ἀλήθειαν*), and bring all things to their remembrance, whatsoever he had said unto them; but if they had not comprehended the meaning of what he said, the bare remembrance of his sayings would have been of little importance. That before this miraculous shedding abroad of the Spirit they had but a very imperfect knowledge of his doctrines, and of the purpose for which he had come into the world, is apparent from that unseasonable question which they put to him when assembled to witness his glorious ascension; "Lord, wilt thou at this time restore again the kingdom to Israel?"

Their minds still cherishing with fondness the vain prospect of temporal power; but after the day of Pentecost they were directed to nobler objects. From the same Spirit they received diversities of gifts besides that of language; for we are assured by St Paul *, when speaking of the early converts to Christianity in general, that "to one was given by the Spirit the word of wisdom; to another the word of knowledge by the same Spirit; to another FAITH by the same Spirit; to another the gifts of HEALING by the same Spirit; to another the working of MIRACLES; to another PROPHECY; to another DISCERNING OF SPIRITS; to another DIVERS KINDS OF TONGUES; to another the INTERPRETATION of tongues;" and these gifts, which were severally divided either among private Christians or among the inferior orders of ministers in the church, we have reason to believe were all bestowed in a greater or less degree upon each of the apostles.

 xii. 8-12

Men thus endowed were well qualified to declare unto the world all the council of God. By the word of wisdom they communicated to the Gentile nations a pure system of what is called *natural religion*; turning them from the vanity of idols to the worship of the living God: by the word of *knowledge*, they preached the great doctrines of revelation both to Jews and Gentiles, shewing them that there is none other name under heaven given unto men whereby they may be saved than the name of Jesus Christ (2); and by their gifts of *healing* and of *miracles*, &c. they were enabled to prove unanswerably that their doctrines were divine. They taught everywhere the unity of God, the creation of the world, the fall of man, the necessity of redemption, the divinity of the Redeemer, his sacrifice on the cross to restore mankind to their forfeited immortality, and the terms of the new covenant into which they had through him been graciously admitted by God.

Such a view as our limits would admit of we have given of all these doctrines, except that which respects the terms of the gospel covenant; but these being explicitly stated only by St Paul and St James, we could not till now investigate them, without violating the historical order into which, for the sake of perspicuity, we have digested the several parts of this short system. Our Saviour himself has indeed taught with great plainness the necessity of faith and baptism

(L) It is not perhaps easy to determine what is here meant by the word of WISDOM and the word of KNOWLEDGE, as distinguished from each other. By the former (*λογος σοφιας*), bishop Warburton understands all the great principles of natural religion. "The ancients (says he) used the word σοφια in this peculiar sense; it is used in the same sense by St Paul in Col. iv. 5.; and we can hardly give it any other in the place before us, where we see the word of wisdom distinguished from the word of knowledge (*λογος γνωσιως*), which evidently means all the great principles of revelation; the term σοφια being as peculiarly applied by Christian writers to revealed religion as σοφια is by the Gentiles to the natural. St Paul uses the word in this sense in 2 Cor. xi. 6. where he says, *Εἰ δὲ καὶ ἰδιαιτὴς τῷ λόγῳ ἂλλ' οὐ τῇ γνώσει*; and St Peter in his first epistle, chap. iii. verse 7. Hence those early heretics, who so much deformed the simplicity and purity of the Christian faith by visionary pretences to superior knowledge of revelation; took from this word the name of Gnostics." See Warburton's Sermon on the Office and Operation of the Holy Ghost.

baptism to the salvation of those who have an opportunity of hearing the gospel preached with power (see BAPTISM); and in his sermon on the mount, which is such a lecture of ethics founded on religion as the Son of God only could have delivered, we learn, that "unless our righteousness shall exceed the righteousness of the Scribes and Pharisees, we shall in no case enter into the kingdom of heaven; that not every one who saith unto Christ, Lord, Lord, shall enter into the kingdom of heaven, but he who doth the will of his Father who is in heaven; and that many will say to him at the day of judgment, Lord, Lord, have we not prophesied in thy name? and in thy name done many wonderful works?" which could not be done without faith; "to whom he will, notwithstanding, say, Depart from me, ye that work iniquity †." St Paul, however, seems to attribute our justification to the bare act of believing; for he repeatedly assures us, "that a man is justified by faith without the deeds of the law;" while St James, on the other hand, affirms, "that by works a man is justified, and not by faith only."

This apparent difference in the language of the two apostles, for we hope to show that it is only apparent, has produced among divines opinions really different respecting the justification of Christians; and the principal of these opinions it is our duty to state. But previous to this, it will be necessary to ascertain the meaning of the word *justification*; for we are sorry to say, that for want of accurate definitions, many theological controversies are nothing better than empty logomachies; and perhaps against no controversy can this charge be brought with greater truth than against that which, in the end of the last century and in the beginning of the present, was so violently agitated concerning the *causes*, the *instruments*, and the *conditions*, of justification.

Between *pardon* of sin and *justification* there is so close a connection, that many writers seem to consider the terms as synonymous, and to infer, that he who is pardoned is *ipso facto* justified. That every Christian, who shall be pardoned at the judgment of the great day, will likewise be justified, is indeed true; but in propriety of speech, *justification* is a word of very different import from *pardon*, and will entitle the Christian to what mere pardon could not lead him to expect. An innocent person, when falsely accused and acquitted, is *justified* but not *pardoned*; and a criminal may be *pardoned*, though he cannot be *justified* or declared innocent. A man whose sins are pardoned is free from punishment; but the justified Christian is entitled to everlasting life, happiness, and glory. If we were only pardoned through Christ, we should indeed escape the pains of hell, but could have no claim to the enjoyments of heaven; for these, being more than the most perfect human virtue can merit, must be, what in the Scriptures they are always said to be, "the gift of God through Jesus Christ our Lord." Hence it is that St Paul, distinguishing, as we have done upon his authority, between mere remission of sins and justification of life, declares †, that "Jesus our Lord was *delivered* for our offences, and *raised* again for our *justification*."

The word justification, as used both by St Paul and St James, has been very generally considered as a forensic term expressing the sentence of a judge. The most eminent reformed divines of all denominations*, and even many of the Romanists themselves, have strenuously contended, that this is its genuine sense, when it is distinguished from mere remission of sins, regeneration, and sanctification; and if so, it will signify God's pronouncing a person *just*, either as being perfectly blameless, or as having fulfilled certain conditions required of him in the Christian covenant. But that "there is not a just man upon earth, who doth good and

finneth not," is made known to us by the most complete evidence possible, the joint dictates of our own consciences and of divine revelation; and therefore whosoever is pronounced just by the Judge of all the earth, must be so, either because, though not absolutely blameless, he has performed the conditions required of him in the covenant of grace, or because Christ has fulfilled all righteousness in his stead.

If this be the Scripture notion of justification, it must be wholly the act of God, and cannot be the effect either of our faith or of our virtue. Accordingly, we are said by the apostle to be justified freely by his grace through the redemption that is in Jesus Christ; whom *God hath set forth* to be a propitiation through faith in his blood †. The act of justification therefore proceeds from the divine philanthropy, and cannot be performed by the instrumentality of faith; for it is not God, but man, who believes; and man is not the justifier of himself. To talk of any kind of *instrument* of justification besides the propitiation set forth by God, is indeed to make use of very improper language: "Omnis causa instrumentalis (says Bishop Bull †), suo modo in effectum inluit, eique effecti productio proprie attribui potest. Jam vero, cum justificatio nihil aliud sit quam gratus Dei actus, quo peccata nostra nobis condonet, ac nos ad salutem acceptet, valde absurdum esset dicere, vel fidem, vel opera nostra, vel quidvis aliud nostrum aut remittere peccata nostra, aut personas nostras acceptare: quod tamen, si instrumentalis causa justificationis fides sit, plane dicendum esset."

In this sentiment of the illustrious Bishop of St David's, some of the most eminent divines both among the Calvinists and Arminians agree; and indeed it is not easy to be conceived how any man can entertain a different sentiment, when considering justification in its proper sense. Many, however, have chosen to treat of justification not only in the active sense, as it is the act of God, for all admit that it is he who justifies; but likewise in a passive sense, as it means our *privilege* or *possession* holden of him, when we are said to be justified by his grace. In this view of the subject they may talk, with sufficient propriety, of an instrument of justification, not as the mean by which it is conveyed, but as the medium through which it is received by the true Christian. And hence it follows, that the Doctors Waterland and Warburton, of whom the former was not a thorough Calvinist, and the latter was a professed Arminian, strenuously maintain the doctrine of the Westminster Confession, that "faith receiving and resting on Christ is the alone instrument of justification; though it cannot be alone in the person justified, but must ever be accompanied with all other saving graces, and be a faith which worketh by love."

But notwithstanding this agreement between the leaders of the rival sects, they have found abundant matter of controversy respecting faith and works, in deciding the great question, "Whether, when God justifies man, he considers him as absolutely righteous on account of Christ's righteousness performed in his stead; or only as just, because he has fulfilled the conditions of the covenant of grace, which does not require of him perfect righteousness?" The former is the doctrine of the more rigid Calvinists, the latter that of the Arminians or Remonstrants.

"A notion (says Dr Gill †) obtained some years ago, that a relaxation of the law and the severities of it has been obtained by Christ; and a new law, a remedial law, a law of milder terms, been introduced by him, which is the gospel; the terms of which are, faith, repentance, and new obedience; and though these be imperfect, yet, being sincere, they are accepted by God in the room of a perfect righteousness. But every article of this scheme (continues he) is wrong; for

for the law is not relaxed, nor any of its severities abated; Christ came not to destroy, but to fulfil it; and therefore it requires the same holy, just, and good things, as ever. Nor is the gospel a new law. There is nothing in it (he says) which looks like a law; for it has no commands in it, but all promises, being a pure declaration of grace and salvation by Christ; nor are faith, repentance, and new obedience, required by it as conditions of man's acceptance with God. Faith and repentance are gospel doctrines, and parts of the gospel ministry; they are graces, and not terms required to be performed by men of themselves. Faith is the gift of God, and repentance is a grant from him. It is not true (continues our author) that God will accept of an imperfect righteousness in the room of a perfect one; nor can any thing more highly reflect upon the justice and truth of God, who is the judge of all the earth, than to suppose that he can ever account that as a righteousness which is not one."

† See his
Private
Thoughts of
Religion.

Having thus proved by arguments which were almost in the same words stated long before by Bishop Beveridge †, that the gospel is no relaxation of the law, he proceeds to lay down his own notions of justification, of which (he says) "the sole matter, or that for the sake of which a sinner is justified before God, is the righteousness of Christ—that which he did and suffered on earth, in our nature, in our stead, and as our representative. This is commonly called his active and passive obedience; and when the purity and holiness of his own nature was added to it, the whole made up the *δικαιοσύνη του νόμου*, the righteousness of the law, which was fulfilled by him as the head and representative of his people *; for whatever the law required is necessary to a sinner's justification before God, and it required of sinners more than it did of man in innocence. Man was created with a pure and holy nature, conformable to the pure and holy law of God; and it was incumbent on him to continue so, and to yield in it perfect and sinless obedience; in the failure whereof he was threatened with death. Man did fail; by which his nature was vitiated and corrupted, and his obedience became faulty and imperfect. He therefore became liable to the penalty of the law, and still perfect obedience was required of him. To the justification of a sinner therefore is required the most complete obedience, active and passive; or, in other words, purity of nature, perfect obedience, and the sufferings of death; all which meet in Christ, the representative of his people, in whom they are justified. There are indeed some divines (continues our author) who exclude the active obedience of Christ from being any part of the righteousness by which men are justified. They allow it to have been a condition requisite in him as a Mediator, qualifying him for his office; but deny that it is the matter of justification, or reckoned for righteousness to man. But without the active obedience of Christ the law would not be satisfied; the language of which is, *Do and live*; and unless its precepts be obeyed, as well as its penalty endured, it cannot be satisfied; and unless it be satisfied, there can be no justification. If therefore men are justified by the righteousness of Christ, it must be by his active obedience imputed and made over to them, so as to become their's, even as David describeth the blessedness of the man unto whom God imputeth righteousness without works *. That this is really the way in which men are justified, our author thinks evident, because they must be justified either by an inherent or by an imputed righteousness; but they cannot be justified by their own inherent righteousness, for that is imperfect, and therefore not justifying. Hence the apostle counts all things but dung, that he may win Christ and be found in him; not having his own righteousness, which is of the law, but that which is through the faith of

* Rom. iv.
6.

Christ, the righteousness which is of God by Faith †. But by such a righteousness as this a man cannot be justified in any other way than by an imputation of it to him. Whence it follows, that 'as by one man's disobedience many were made sinners by imputation, so by the obedience of one shall many be made righteous, by having that obedience placed to their account."

As this author properly considers justification as the act of God, he does not approve of the language in which faith is called the instrument either of conferring or receiving it. "Faith (says he *) is merely the evidence of justification to the person justified; for 'faith is the evidence of things not seen.' The righteousness of God, of the God-man and Mediator Jesus Christ, is revealed from faith to faith in the everlasting gospel †; and therefore must be before it is revealed, and before the faith to which it is revealed. Faith is that grace whereby a soul, having seen its guilt and its want of righteousness, beholds in the light of the Divine Spirit a complete righteousness in Christ, renounces its own, lays hold on that, puts it on as a garment, rejoices in it, and glories of it; the Spirit of God witnessing to his spirit that he is a justified person: and so he is evidently and declaratively 'justified in the name of the Lord Jesus, and by the Spirit of our God †'. Faith adds nothing to the *esse*, only to the *bene esse* of justification; which is a complete act in the eternal mind of God, without the being or consideration of faith, or any foresight of it. In the account of God, a man is as much justified before his faith as after it; and after he does believe, his justification depends not on his acts of faith, for though *we believe not, yet God abides faithful* to his covenant-engagements with his Son, by whose suretyship-righteousness the elect are justified; but by faith men have a comfortable sense, perception, and apprehension, of their justification, and enjoy that peace of soul which results from it. It is by that only, under the testimony of the Divine Spirit, that they know their interest in it, and can claim it, and so have the comfort of it."

Though this language differs from that of the Westminster Confession, the author seems not to teach a different doctrine; for if faith be that grace by which a soul renounces its own righteousness, and lays hold of Christ's, which it puts on as a garment, it must be that very thing which the compilers of the Confession meant by their definition of faith receiving and resting on Christ and his righteousness, when they called it "the alone instrument of justification." Accordingly our author elsewhere * teaches, that "true faith in sensible sinners assents to Christ and embraces him, not merely as a Saviour of man in general, but as a special suitable Saviour for them in particular. It proceeds upon Christ's being revealed in them as well as to them, by the spirit of wisdom and revelation, in the knowledge of him as a Saviour that becomes them. It comes not merely through external teachings by the hearing of the word from men; for no man, saith our blessed Lord, can come to me except the Father draw him; but such souls as are thus drawn, having heard and learned of the Father, believe not only in the doctrine of Christ, but also in himself, trusting in him alone for everlasting life and salvation."

Were it not that this author, in every thing that he writes, has an eye to the doctrine of election and reprobation, which he serews up to a greater height than almost any other divine with whose works we are acquainted, he would differ little in his notions of justification from the more moderate Arminians. "Justification (says Limborch) is the merciful and gracious act of God, whereby he fully absolves from all guilt the truly penitent and believing soul, through and for the sake of Christ apprehended by a true faith: or gratuitously remits sins upon the account of faith in

in Jesus Christ, and graciously imputes that faith for righteousness." Here indeed the imputation of Christ's righteousness is expressly denied; but our countryman Dr Waterland, who can hardly be considered as a Calvinist, seems to contend for the imputation of that righteousness to the finner, as well as for faith being the instrument by which it is received.

"It cannot be for nothing (says that able writer *) that St Paul so often and so emphatically speaks of man's being justified by faith, or through faith in Christ's blood; and that he particularly notes it of Abraham, that he believed, and that his faith was counted to him for justification, when he might as easily have said that Abraham, to whom the gospel was preached, was justified by gospel faith and obedience, had he thought faith and obedience equally instruments of justification. Besides, it is on all hands allowed, that though St Paul did not directly oppose faith to *evangelical works*, yet he comprehended the works of the *moral law* under those which he excluded from the office of *justifying*, in his sense of the word justification. He even used such arguments as extended to all kinds of works; for Abraham's works were excluded, tho' they were undoubtedly evangelical. To prove that he interprets the apostle's doctrine fairly, our author quotes, from the genuine epistle of Clemens of Rome, a passage, in which it appears beyond a doubt that this fellow-labourer of St Paul so understood the doctrine of justifying faith as to oppose it even to evangelical works, however exalted. It is true (continues our author), Clemens elsewhere, and St Paul almost everywhere, insists upon true holiness of heart and obedience of life as indispensable conditions of salvation or justification; and of that, one would think, there could be no question among men of any judgment or probity. But the question about conditions is very distinct from the other question about instruments; and therefore both parts may be true, viz. that faith and obedience are equally conditions, and equally indispensable where opportunities permit; and yet faith over and above is emphatically the instrument both of receiving and holding justification, or a title to salvation.

"To explain this matter more distinctly, let it be remembered, that God may be considered either as a party contracting with man on very gracious terms, or as a Judge to pronounce sentence on him. Man can enter into the covenant, supposing him adult, only by assenting to it, and accepting it, to have and to hold it on such kind of tenure as God proposes: that is to say, upon a self-denying tenure, considering himself as a guilty man standing in need of pardon, and of borrowed merits, and at length resting upon mercy. So here, the previous question is, Whether a person shall consent to hold a privilege upon this submissive kind of tenure or not? Such assent or consent, if he comes into it, is the very thing which St Paul and St Clemens call *faith*. And this previous and general question is the question which both of them determine against any proud claimants who would hold by a more self-admiring tenure.

"Or if we next consider God as sitting in judgment, and man before the tribunal going to plead his cause; here the question is, What kind of plea shall a man resolve to trust his salvation upon? Shall he stand upon his innocence, and rest upon strict law? or shall he plead guilty, and rest in an act of grace? If he chooses the former, he is proud, and sure to be cast: if he chooses the latter, he is free so far in throwing himself upon an act of grace. Now this question also, which St Paul has decided, is previous to the question, What conditions even the act of grace itself finally infill upon? A question which St James in particular, and the general tenure of the whole Scripture, has abundantly latished; and which could never have been made a question by

any confederate or impartial Christian. None of our works are good enough to stand by themselves before him who is of purer eyes than to behold iniquity. Christ only is pure enough for it at first hand, and they that are Christ's at second hand in and through him. Now because it is by faith that we thus interpose, as it were, Christ between God and us, in order to gain acceptance by him; therefore faith is emphatically the instrument whereby we receive the grant of justification. Obedience is equally a condition or qualification, but not an instrument, not being that act of the mind whereby we look up to God and Christ, and whereby we embrace the promises."

But though our author contends that faith is the instrument of justification, he does not, like the Antinomians, teach that it will save men without works. "The covenant of grace (says he) has conditions annexed to it of great importance, for without them no instruments can avail. These are faith and obedience, as St James hath particularly maintained. St Paul had before determined the general and previous question respecting the plea by which we ought to abide; and when some libertines, as is probable, had perverted his doctrine of faith and grace, St James showed that the very faith which rests in a covenant of grace implies a cordial submission to the conditions of that covenant, otherwise it would be nothing but an empty ceremony. The perfect agreement between St Paul and St James in the article of *justification*, appears very clear and certain. St Paul declares, that in order to come at justification, it is necessary to stand upon grace, not upon merit; which St James does not deny, but rather confirms, in what he says of the perfect law of liberty (James i. 25. ii. 12). St Paul makes faith the instrument of receiving that grace; which St James does not dispute, but approves by what he says of Abraham (ii. 23.); only he maintains also, that, in the conditionate sense, justification depends equally upon faith and good works; which St Paul also teaches and inculcates in effect, or, in other words, through all his writings. If St Paul had had precisely the same question before him which St James happened to have, he would have decided just as St James did; and if St James had had precisely the same question before him which St Paul had, he would have determined just as St Paul did. Their principles were exactly the same, but the questions were diverse; and they had different adversaries to deal with, and opposite extremes to encounter, which is a common case.

"It may be noted, that that faith which is here called a *condition*, is of much wider compass than that particular kind of faith which is precisely the instrument of justification. For faith as a condition means the whole complex of Christian belief, as expressed in the creeds; while faith as an instrument means only the laying hold on grace, and resting in Christ's merits in opposition to our own deservings: though this also, if it is a vital and operative principle (and if it is not, it is nothing worth), must of course draw after it an hearty submission to, and observance of, all the necessary conditions of that covenant of grace wherein we repose our whole trust and confidence. So that St Paul might well say, "Do we then make void the law (the moral law) through faith? God forbid: Yea, we establish the law." * R. m. iii. We exempt no man from religious duties; which are duties, still, though they do not merit nor are practicable to such a degree as to be above the need of pardon: they are necessary conditions in their measure of justification, though not sufficient in themselves to justify, nor perfect enough to stand before God or to abide trial: therefore Christ's merits must be taken in to supply their defects: and so our resting in Christ's atonement by an humble self-denying which is our last resort, our anchor of salvation both sure and sted-

The logy, more peculiarly Christian.

209 Faith and obedience its conditions.

Theology. faith, &c. we have otherwise done our utmost towards the more zealous Arminians. fulfilling of God's sacred laws, towards the performing of all the conditions required.

“That good works, internal and external, are according as opportunities offer and circumstances permit, *conditions* properly so called, is clear from the whole tenor of Scripture, as hath been often and abundantly proved by our own divines (M), and is admitted by the most judicious among the foreign Reformed (N). Yet some have been very scrupulous as to this innocent name, even while they allow the absolute necessity of good works as indispensable qualifications for future blessedness. Why not conditions therefore as well as qualifications? Perhaps because that name might appear to strike at absolute predestination, or unconditional election; and there may lie the scruple: otherwise the difference appears to lie rather in words than in things.

“Some will have them called not conditions, but *fruits* or *consequents* of justification. If they mean by justification the same as the grace of the Holy Spirit, and the first grace of faith springing from it, they say true; and then there is nothing more in it than an improper use of the word *justification*, except that from abuse of words very frequently arises some corruption of doctrine. If they mean only, that outward acts of righteousness are fruits of inward habits or dispositions; that also is undoubtedly true: but that is no reason why internal acts, virtues, graces (good works of the mind), should not be called conditions of justification; or why the outward acts should not be justly thought conditions of preserving it. But if they mean that justification is ordinarily given to adults, without any preparative or previous conditions of faith and repentance, that indeed is very new doctrine and dangerous, and opens a wide door to carnal security and to all ungodliness.”

Such is the doctrine of Christian justification as it has been taught by the followers of Calvin, and by some of the most eminent Arminians who flourished in the end of the last and beginning of the present century. They appear not, from this view of their opinions, to differ so widely as some of them have wished the world to believe. It is evident that Dr Waterland, though he rejects some of the distinguishing tenets of Calvinism, lays greater stress upon faith in his scheme of justification than Dr Gill himself; and that they both consider it as the *instrument* by which the adult Christian must receive the imputed righteousness of Christ. The greater part of modern Arminians, however, exclaim against the imputation of Christ's righteousness, as a doctrine false in itself, and fraught with the most pernicious consequences; and they would be ready to tell Dr Gill, in his own words, that of his scheme every article is wrong. It is not true (say they) that God exacts of man, or ever did exact of him, an obedience absolutely perfect; for under every dispensation man was in a state of discipline, and had habits of virtue and piety to acquire; and it is probable that his progress in piety, virtue, and wisdom, will continue for ever, as none but God is perfect and stationary, and incapable of deviating from the line of rectitude. Most of them, after Bishop Bull, dislike the use of such unscriptural phrases as *the instrument of justification*, applied either to faith or to works; and think, that by considering God as the sole justifier of man, upon certain conditions, they can more precisely ascertain the distinct provinces of faith and obedience in the scheme of justification, than either their brethren of the old school of Arminius, or their rivals of the school of Calvin.

By the very constitution of man, piety and virtue are duties which, if he do not sincerely perform, he must of course forfeit the favour of his Maker; but the most perfect performance of his natural duties would not entitle him to a supernatural and eternal reward. Eternal life is the gift of God through Jesus Christ; and it is surely reasonable that we should acknowledge it to be so, and not claim it as a debt due to our merits. The pious and virtuous man has a natural claim to more happiness than misery during the period of his existence, a claim founded on the attributes of that God who called him into being; but he has no natural claim to a future life, and still less to a perpetuity of existence. This is a truth not more clearly taught in the holy scripture than consonant to the soundest philosophy: and yet, by not attending to it, have St Paul and St James been set at variance, and the most opposite doctrines taught respecting the justification of Christians.

Because faith in Christ cannot entitle a wicked man to eternal happiness, one class of divines seem to infer that such faith is not necessary to Christian *justification*, and that “his faith cannot be wrong whose life is in the right.” They proceed upon the supposition that man is naturally immortal; that piety and virtue are entitled to reward; and that therefore the pious and virtuous man whatever be his belief, must undoubtedly inherit an eternal reward. But this is very fallacious reasoning. That piety and virtue are through the divine justice and benevolence entitled to reward, is indeed a truth incontrovertible; but that man who is of yesterday is naturally immortal; that a being who began to exist by the mere good will of his Maker, has in himself a principle of perpetual existence independent of that will—is a direct contradiction. Whatever began to be, can be continued in being only by the power, and according to the pleasure, of the infinite Creator; but it pleased the Creator of his free grace at first to promise mankind eternal life, on the single condition of their first father's observing one positive precept. That precept was violated, and the free gift lost: but the covenant was renewed in Christ, who “by his death hath abolished death, and by his resurrection hath brought to light life and immortality.” The condition annexed to the gift thus restored was faith; for “being justified by faith, we have peace with God through our Lord Jesus Christ; by whom also we have access by faith into this grace wherein we stand, and rejoice in the hope of eternal life, and the glory of God.” Faith therefore in the Son of God and Saviour of the world, is not only a condition, but the *sole* condition, of that justification which is peculiarly Christian; for since Christ, without any co-operation of ours, hath purchased for us the free gift of eternal life, we shall be guilty of the grossest ingratitude to our Divine Benefactor, and impiously claim an independence on God, if we look upon that gift either as a right inherent in our nature, or as a debt due to our meritorious deeds.

But though faith be the condition of Christian justification, as that implies the inheritance of *eternal life*, there are other conditions to be performed before a man can be put in possession of *eternal felicity*. By a law long prior to the promulgation of the gospel—a law interwoven with our very being—no man can enjoy the favour of his Maker, who does not make it his constant endeavour “to do justly, to love mercy, and to walk humbly with his God.” This law was in force before man fell; it continues to be in force now that he is redeemed; and it will not be abrogated even at that

210
Objections of the more zealous Arminians to this statement of the doctrine.

(M) Bull. *Op. Latin.* p. 412, 414, 415, 430, 434, 514, 516, 544, 583, 645, 668. *Edit. ult.*—Stillingfleet's Works, vol. III. p. 367, 380, 393, 398.—Tillotson's Posthumous Sermons, vol. II. p. 484, 487.

(N) Vossius *de Bonis Operibus*, Theol. x. p. 370.—*Op. tom. VI. Frid. Spanhem. fil. Op. tom. III. p. 141, 159.*

logy, that period when faith shall give place to vision, and hope to enjoyment. By the grace of the Christian covenant, all mankind are rendered immortal in consequence of the death and resurrection of Christ, who is the Lamb slain, in the divine decree, from the foundation of the world; but to obtain immortal *happiness*, they must observe the conditions both of natural and of revealed religion, which are repentance from dead works, and faith in Christ the Redeemer. The former is that condition upon which alone we can retain the Divine favour, and of course enjoy either present or future happiness; the latter is a most equitable acknowledgment required of us, that perpetual conscious existence is neither a right inherent in our nature, nor a debt due to our virtuous obedience, but merely the gift of God through Jesus Christ our Lord.

"To make the distinct provinces of faith and works in the business of justification clear, let us suppose (says bishop Warburton †), that, at the publication of the gospel, all to whom the glad tidings of immortality were offered on the condition of *faith in Jesus* had been moral or virtuous men, and on that account entitled (as natural religion teacheth) to the favour of God and an abundant reward; is it not self-evident, that FAITH ALONE, exclusive of the condition of good works, would, in that case, have been the very thing which *justified* or entitled them to life *everlasting*? But are *good works*, therefore, of no use in the Christian system? So far from it, that those only who serve God in sincerity and in truth are capable of the justification which faith alone embraces; for, to illustrate this matter by a familiar instance, suppose a British monarch to bestow, in *free gift*, a certain portion of his own *domains*, to which immortality may well be compared, upon such of his subjects as should perform a certain service to which they were not obliged by the laws of the kingdom; it is evident that the performance of this last service ONLY would be the thing which entitled them to the *free gift*. Yet it is obvious that obedience to the laws, which gave them a claim to protection as subjects, in the enjoyment of THEIR OWN PROPERTY (to which the reward offered by natural religion may be compared), would be a previous and necessary qualification to their enjoyment of their new possession; since it is absurd to suppose that such a *gift* could be intended for rebels and traitors, or indeed for any but good and faithful servants of their king and country." Well therefore might the apostle reprove the ignorance or licentiousness of certain of his converts at Rome, in his question—"Do we then make void the LAW through FAITH? God forbid! yea, we ESTABLISH THE LAW;" obedience to it being the previous qualification of all who are entitled to the fruits of justifying faith—LIFE AND IMMORTALITY.

Had proper attention been paid to this distinction, which St Paul everywhere makes between such duties as are common to all religions that are true, and those which are peculiar to the Christian revelation, many useless controversies might have been avoided respecting the instrument of justification and the conditions of the Christian covenant. By not attending to it, the divines of one school, who perceive that the mere belief of any truth whatever cannot entitle a man to eternal felicity, have almost dropt faith from their system of Christianity, and taught moral duties like Pagan philosophers; whilst another party, who err almost as far in their interpretations of scripture, finding eternal life represented as the *gift of God*, and faith in Christ as the instrument or means by which that gift must be accepted, have expunged from their system the necessity of good works, forgetting surely that wicked believers, like believing devils, may be doomed to an eternity of torments. But the sum of Christianity, as we are taught by the beloved disciple, is

comprehended in this one commandment of God, "that we should believe on the name of his Son Jesus Christ, and love one another as he gave us commandment." In perfect harmony with him, the great apostle of the Gentiles, from whose mistaken words much empty noise has been raised about this question, assures us, that "in Christ Jesus no thing can avail to our eternal happiness but faith which WORKETH BY LOVE;" and he informs Titus †, that it "is a true saying, and what he wills to be constantly affirmed, that they who have believed in God be careful to maintain good works."

Indeed no man can have complete faith in Christ, who believes not the promises of the gospel; but all those promises, except the single one of a resurrection from the dead to perpetual conscious existence, are made to us upon the express condition that we obey the law of the gospel; "for God will render to every man according to his deeds: to them that are contentious and do not obey the truth, but obey unrighteousness, indignation and wrath; tribulation and anguish upon every soul of man that doth evil, of the Jew first and also of the Gentile; but glory, honour, and peace to every man that worketh good, to the Jew first and also to the Gentile *."

Such are the notions of justification entertained by those who in the present age have been considered as the leaders of the sect of Arminians. How far they are just, the reader must decide for himself, as our business is little more than to collect into one point of view the scattered opinions of others; but under every view of this doctrine which we have taken, the Christian covenant appears much more gracious than that into which Adam was admitted in paradise; since it affords room for repentance, even to that man, who may be so unhappy as to be withdrawn for a time into apostasy from the terms of the covenant. Whether the death of Christ therefore was a *direct* atonement for the actual sins of men, or only operated as such *indirectly* by procuring for them repeated opportunities of repentance, it is an undoubted truth, that "if through the offence of one many be dead, much more the grace of God, and the gift by grace, which is by one man, Jesus Christ, hath abounded unto many. And not as it was by one that sinned, so is the gift: for the judgment was of one offence to *condemnation*, but the free gift is of many offences to *justification* †."

Thus graciously has the divine goodness displayed itself in the restoration of our lost inheritance. But it stoppt not here. The same bountiful Lord of life, for its further security, imparts to every true believer the strength and light of his holy spirit to support faith in working out our own salvation. Our blessed Saviour, "who gave himself for us, that he might redeem us not only from death, but likewise from all iniquity, and purify to himself a peculiar people zealous of good works †," promised, before he left this world, to send his followers the Holy Ghost or Comforter to abide with them for ever, to guide them into all truth, to bring all things to their remembrance whatsoever he had said unto them, and, as we learn from other passages of scripture, to "work in them both to will and to do of his good pleasure." How amply this promise was fulfilled to the apostles, we have already seen; but we are not to suppose that it was restricted to them. As man is designed for a supernatural state in heaven, he stands in need of supernatural direction to guide him to that state. "No man (says our Saviour) can come to me except the Father draw him; for as no man knoweth the things of a man save the spirit of a man which is in him, even so none knoweth the things of God but the Spirit of God." This omniscient Spirit indeed "searcheth all things, yea even the deep things of God," and revealeth them to the sons of men, to enlighten

218 Christians by the Holy Ghost, who

Theology, their understandings and purify their hearts. The grace which he sheds abroad is either external and general, or internal and particular. The former has been extended to the whole church of God under the patriarchal, Mosaic, and Christian dispensations, in such a revelation of the divine will as was sufficient to instruct men unto eternal life, whether they had a clear view or not of that stupendous plan of redemption, by which the kingdom of heaven was opened to them after the forfeiture of the terrestrial paradise; for there have been "holy prophets ever since the world began; and prophecy came not at any time by the will of man, but holy men of God spake as they were moved by the Holy Ghost." Hence it is that all scripture was given by inspiration of God to teach us every thing which it is necessary for us to know and believe; and the scripture is that work of the spirit which is extended to the universal church.

* Luke i. 70. and i. 2 Peter i. 21.

But the same spirit which thus generally reveals the object of faith to the church, does likewise particularly illuminate the minds of individual believers, working in them an assent to that which is taught them from the written word. It was thus that "the Lord opened the heart of Lydia †, that she attended to the things which were spoken of Paul;" it is thus that "the word preached doth not profit if it be not mixed with faith in them who hear it ‡;" and it is thus that "God deals to every man the measure of faith §;" for "by grace are we saved through faith, which is not of ourselves; it is the gift of God §." This illumination of the Spirit was conveyed to the apostles "in a sound from heaven as of a rushing mighty wind," because it was meant to testify to the world that they were chosen ministers of the gospel; but the ordinary Christian receives it "in the still small voice," because it is conveyed to him only to "open his understanding that he may understand the scriptures."

Regene-
rates them,

Another operation of the Spirit on the minds of believers is that which in scripture is called REGENERATION; for "according to his mercy God saveth us by the washing of regeneration and renewing of the Holy Ghost *, which he sheds on us abundantly through Jesus Christ our Lord." To those who believe that we derive from Adam a corrupted nature, this particular grace must appear to absolutely necessary, that without it we could have no relish for heaven or heavenly things. "The natural man (we are told) receiveth not the things of the Spirit of God; for they are foolishness to him; neither can he know them, because they are spiritually discerned." Indeed whatever be the powers of our moral faculties, when compared with those of our first father, it is so long before they be completely developed, that we should infallibly be lost, if we were not blessed by a supernatural guide, when reason is incapable of directing our conduct. Our passions and appetites are in their full strength before experience has furnished the mind with materials, by means of which motives may be weighed; and therefore it would be impossible, during the giddy period of youth, to keep them in due subjection, or to prevent vicious habits from being formed, were we not influenced by divine grace. So true is it, that "except a man be born again of water and of the Holy Ghost, he cannot enter into the kingdom of God." This change in our dispositions, from an immoderate attachment to earth to a relish for the things of heaven, is in scripture called "a renewing of our minds, a new creation, a new man;" in opposition to our natural disposition, which is called "the old man, corrupted according to the deceitful lusts." The ancient fathers of the church, as well as some very eminent modern divines †, generally speak of baptism as the instrument in God's hand of man's regeneration; and for the truth of their opinion they

Theolo
more pe
larly C
stian.

A third office of the Holy Spirit is to lead, direct, and govern us through all the periods of our lives. Without such a leader and guide, the temptations with which we are surrounded would certainly overcome us, and we should faint long before we arrive at the end of our journey. By the very constitution of our nature we are subjected in some degree to the influence of sense, of which the objects are present, whilst the enjoyments of heaven are future, and seen, as at a distance, only by the eye of faith; but "the law of the Spirit of life, in Christ Jesus, hath made us free from the law of sin and death;" for God worketh in us both to will and to do of his good pleasure; and as many as are thus led by the spirit of God, they are the sons of God; and while they walk in the Spirit, they do not fulfil the lusts of the flesh." Without the aid of the same Spirit, we could not even make our prayers acceptable; for since "our confidence in God is, that he heareth us only when we ask any thing according to his will; and since we know not what we should pray for as we ought, the Spirit itself maketh the intercession for us with groanings which cannot be uttered *."

220
Guides
them
through
life,

A fourth operation of the Holy Ghost, as he is the sanctifier of Christians, is to join them to Christ, and make them members of that one body of which he is the head. "For by one Spirit are we all baptized into one body †; and as the body is one and hath many members, and all the members of that one body being many are one body, so also is Christ." Hereby we know that God abideth in us, by the Spirit which he hath given us; and as, in the ordinary course of his dealings with Christians, this Spirit is first given in baptism, so is it continued to the faithful by the instrumentality of the Lord's supper. That ordinance we have elsewhere (see *SUPPER of the Lord*) proved to be a federal rite; and surely no time can be supposed so highly sanctified for the reception of the graces of the Holy Spirit, as that in which we renew our federal union with our Lord and Maller in the communion of his body and blood.

* Rom. v. 26.

† 1 Cor. xii. 12, 13.

221
Unites
them to
Christ,

It is likewise the office of the Holy Ghost to give us an earnest of our everlasting inheritance, to create in us a sense or the paternal love of God, and thereby to assure us of the adoption of sons. "As many as are led by the Spirit of God, they are the sons of God; and because we are sons, God hath sent forth the spirit of his Son into our hearts. For we have not received the spirit of bondage again to fear; but we have received the Spirit of adoption, whereby we cry Abba Father; the Spirit itself bearing witness with our spirit, that we are the children of God †."

As the gifts of grace are generally annexed to means, to the proper use of the word and sacraments, it is a sixth office of the same Spirit to sanctify such persons as are regularly set apart for the work of the ministry, and ordained to offer up the public prayers of the people; to bless them in the name of God; to teach the doctrines of the gospel; to administer the sacraments instituted by Christ; and to perform all things necessary "for the perfecting of the saints, for the work of the ministry, for the edifying of the body of Christ *." The same Spirit which illuminated the apostles, and endowed them with power from above to perform personally their apostolic functions, fitted them also for sending others, as they were sent by their Divine Maller; and for establishing such a constitution of the church as was best adapted for preserving Christians in the unity of the Spirit and bond of peace. They committed a standing power to a successive ministry to be conveyed down to the end of the world; and those who are vested with that power are obliged to "take heed unto themselves, and

ogy, to all the flock over which the HOLY GHOST hath made them overseers, to feed the church of God, and to contend earnestly for the faith which was once delivered unto the saints †." See EPISCOPACY, INDEPENDENTS, PRESBYTERIANS, POPE, and QUAKERS.

By these, and the like means, doth the Spirit of God sanctify the sons of men; and in consequence of this sanctification proceeding immediately from his office, he is called the HOLY Spirit and the COMFORTER. This is such a provision "for renewing us in the spirit of our minds, and enabling us to put on the new man, which, after God, is created in righteousness and true holiness," as, when made known by revelation appears to have been expedient, may be conceived to have been even necessary, and, though reason could hardly have hoped for it, is contradicted by none of our natural notions either of God or of man. Many, however, are the controversies to which it has given rise in the church of God; some contending that it is given only unto the elect, upon whom it operates with resistless efficacy; others affirming that it is offered to all, but in such a manner as that, by the abuse of their free will, it may be "resisted, grieved, and quenched;" and some few, still intoxicated with the pride of PELAGIUS, think it is not necessary, and of course is not bestowed.

The questions concerning *election*, the *efficacy of grace*, and the *final perseverance of the saints*, we have stated elsewhere, and given a summary view of the arguments by which the contending parties maintain their respective opinions (see PREDESTINATION); and the texts of Scripture which we have just quoted, under the different heads of sanctification, show sufficiently that the opinion of Pelagius is directly contrary to the doctrine of the apostles. It may not be improper to inquire whether it be as agreeable to reason and experience as its proud patrons seem to imagine.

If it be unreasonable to expect any assistance from the Spirit of God in carrying on the work of our own salvation, how came so many of the wisest and best of men in all ages to believe, that he who sincerely endeavours to discharge his duty is supported in that endeavour by assistance from heaven? That such was the popular belief of the early Greeks, is evident from the poems of Homer; in which we everywhere find some god calming the passions of the heroes, altering their determinations when improper, and inspiring them with wisdom. Nor was this the sentiment of the poets only. Socrates, it is well known, professed to believe that his own conduct was under the direction of a superior spirit, which he called a *demon*; and Plutarch, as we find him quoted by Wollaston, speaks of the gods assisting men, by "exciting the powers or faculties of the soul; by suggesting secret principles, imaginations, or thoughts; or, on the contrary, by diverting or stopping them." Of the same opinion must Cicero have been, when he said, "stabit illud quidem, quod locum hunc continet, de quo agimus, esse Deos, et eorum providentia mundum administrari, eodemque consulere rebus humanis, nec solum *universis*, verum etiam *singulis*;" for it is not conceivable that a particular providence can be administered without the influence of the Deity on the minds of men. That the poets and philosophers of the heathen world derived these notions from primeval tradition, cannot, we think, be questioned; but if they were absurd in themselves, or apparently contradictory to the laws of nature, they would not surely have been so universally embraced; for it will hardly be denied, that Socrates and Cicero were men of as great natural sagacity as Pelagius or any of his followers. It is indeed so far from being incredible that the Father of spirits occasionally di-

rects the thoughts and actions of men, that we believe there are very few who have made observations upon themselves and their own affairs, who have not found, upon reflection, many instances in which their usual judgment and sense of things were *over-ruled*, they know not *how* or *why*; and that the actions which they performed in those circumstances have had consequences very remarkable in their general history. See PROVIDENCE, n^o 18, 19.

This being the case, why should the pride of Christians make them hesitate to admit, upon the authority of divine revelation, what Socrates, and Plutarch, and Cicero, and all the virtuous and wise men of antiquity, admitted in effect, upon no better evidence than that of oral tradition, supported by their own meditations on their own thoughts, and the principles of their own conduct? Is it that they see not such beneficial effects of Christianity as to induce them to believe the professors of that religion to be indeed "chosen to salvation through the sanctification of the Spirit?" Let them study the practical precepts of the gospel, consider the consequences which they have had on the peace and happiness of society, and compare the general conduct of Christians with that of the Jews, Pagans, and Mahometans (see RELIGION), and they will doubtless find reason to alter their opinion; and let those who embrace the truth, remember, that as they are the temple of God, if the Spirit of God dwell in them, "it is their indispensable duty to cleanse themselves from all filthiness of the flesh and spirit; to follow peace with all men, and holiness, without which no man shall see the Lord; and to work out their own salvation with fear and trembling, since it is God who worketh in them both to will and to do of his good pleasure."

From this short view of the several dispensations of revealed religion, it is evident that the gospel is not only the best but the last gift of the kind which man has to expect from his Maker; that the scheme of revelation is completed; and that the pretences of Mahomet and of more modern enthusiasts to divine inspiration are not only false, but fraught with contradictions. All these men admit the divine origin of the Mosaic and Christian religions; but it appears from the scriptures, in which those religions are taught, that the system of revealed truths which constitute the Patriarchal, Mosaic, and Christian revelations, commenced with the fall of man, and that it must therefore necessarily end with his restoration to life and immortality by the sacrifice of Christ upon the cross. A new revelation therefore like that of Mahomet cannot be admitted without rejecting the whole Bible, though the impostor himself everywhere acknowledges the inspiration of Abraham, of Moses, and of Christ. Nor is greater regard due to the claims of Christian enthusiasts. Such of these men as pretend to have been in heaven †, and thence to have brought spiritual discoveries to the earth, have either forgotten or never understood, that in the scriptures of the Old and New Testaments the great scene of Providence appears to be closed in the full completion of its one regular, entire, and eternal purpose; that St Paul has pronounced † a curse upon any man or angel from heaven who shall preach another gospel than what has been already preached by the apostles and evangelists; that in their writings we are taught every thing which it is our duty to believe or to practise in order to our own salvation; and that we have the promise of our blessed Lord himself, that the Spirit of truth shall remain with us to guide us into all necessary truth, till that great day when he shall come again to judge the world in righteousness, and render to every man according to his works.

Theophrastus
Theophrastus

THEOPHRASTA, in botany; a genus of plants belonging to the class of *pentandria* and order of *monogynia*. The corolla is campanulated, with divisions and segments obtuse; the capsule unilocular, globular, very large, and many seeded. There is only one species, the *americana*.

THEOPHRASTUS, the philosopher, was born about 371 years before Christ, and was successively the disciple of Plato and of Aristotle. He succeeded Aristotle in the Peripatetic school, and conducted the charge with such high reputation that he had about 2000 scholars. He is highly celebrated for his industry, learning, and eloquence; and for his generosity and public spirit. He is said to have twice freed his country from the oppression of tyrants. He contributed liberally towards defraying the expence attending the public meetings of philosophers; which were held, not for the sake of show, but for learned and ingenious conversation. In the public schools he commonly appeared, as Aristotle had done, in an elegant dress, and was very attentive to the graces of diction. He lived to the advanced age of 85: Some say of 107. Towards the close of his life, he grew exceedingly infirm, and was carried to the school on a couch. He expressed great regret on account of the shortness of life; and complained that nature had given long life to flags and crows, to whom it is of so little value, and had denied it to man, who, in a longer duration, might have been able to attain the summit of science; but now, as soon as he arrives within sight of it, is taken away. His last advice to his disciples was, that, since it is the lot of man to die as soon as he begins to live, they would take more pains to enjoy life as it passes, than to acquire posthumous fame. His funeral was attended by a large body of Athenians. He wrote many valuable works, of which all that remain are, several treatises on the Natural History of Plants and Fossils; Of Winds, Of Fire, &c. a rhetorical work intitled "Characters," and a few metaphysical Fragments.

To Theophrastus we are indebted for preserving the works of Aristotle. See ARISTOTLE.

THEOPOMPUS, a celebrated Greek orator and historian, was born in the island Chios, and flourished in the reign of Alexander the Great. He was one of the most famous of all the disciples of Isocrates, and won the prize from all the panegyricists whom Artemisia invited to praise Mausolus. He wrote several works, which are lost.

THEOREM, a proposition which terminates in theory, and which considers the properties of things already made or done; or it is a speculative proposition deduced from comparing together several definitions. A theorem is something to be proved, and a problem something to be done.

THEORETIC, something relating to theory, or that terminates in speculation.

THEORY, in general, denotes any doctrine which terminates in speculation, without considering the practical uses or application thereof.

THEOSOPHISTS, a sect of men who pretend to derive all their knowledge from divine illumination. They boast that, by means of this celestial light, they are not only admitted to the intimate knowledge of God, and of all divine truth, but have access to the most sublime secrets of nature. They ascribe it to the singular manifestation of divine benevolence, that they are able to make such a use of the element of fire, in the chymical art, as enables them to discover the essential principles of bodies, and to disclose stupendous mysteries in the physical world. They even pretend to an acquaintance with those celestial beings which form the medium of intercourse between God and man, and to a power of obtaining from them, by the aid of magic, astrology, and other similar arts, various kinds of information and assistance.

To this class belonged Paracelsus, Robert Fludd, Jacob Boehmen, Van Helmont, Peter Poiret, and the Rosierucians. They are also called *Fire-Philosophers*, which see.

THERAPEUTÆ, a term applied to those that are wholly in the service of religion. This general term has been applied to particular sects of men, concerning whom there have been great disputes among the learned.

THERAPEUTICS, that part of medicine which acquaints us with the rules that are to be observed, and the medicines to be employed, in the cure of diseases.

THERIACA ANDROMACHI, a compound medicine made in the form of an electuary. See PHARMACY, n^o 605.

THERMÆ, hot baths or bagnios. Luxury and extravagance were in nothing carried to such heights as in the thermæ of the Roman emperors. Ammian explains, that they were built to such an extent as to equal whole provinces; from which Valerius would abate, by reading *figura* instead of *provincia*. And yet after all, the remains of some still standing are sufficient testimonies for Ammian's censure; and the accounts transmitted of their ornaments and furniture, such as being laid with precious stones (Seneca), set round with seats of solid silver (Pliny), with pipes and ceilings of the same metal (Statius), add to, rather than take from, the censure. The most remarkable bagnios were those of Dioclesian and Caracalla at Rome, great part of which remains at this day; the lofty arches, stately pillars, variety of foreign marble, curious vaulting of the roofs, great number of spacious apartments, all attract the curiosity of the traveller. They had also their summer and winter baths.

THERMOMETER, an instrument for measuring the degree of heat or cold in any body.

The thermometer was invented about the beginning of the 17th century; but, like many other useful inventions, it has been found impossible to ascertain to whom the honour of it belongs. Boerhaave * ascribes it to Cornelius Drebbel of Alomar, his own countryman. Fulgenzio † attributes it to his master Paul Sarpi, the great oracle of the Venetian republic; and Viviani gives the honour of it to Galileo ‡. But all these are posthumous claims. Sanctorio § claims this honour to himself; and his assertion is corroborated by Borrelli ¶ and Mahighi * of the Florentine academy, whose partiality is not to be suspected in favour of a member of the Patavinian school.

Perhaps the best way to reconcile these different claims would be, to suppose that the thermometer was really invented by different persons about the same time. We know that there are certain periods in the progress of the arts when the stream of human genius runs in the same direction, and moves towards the same object. That part of the current which reaches the object first may possess the title; but the other parts follow so rapidly and arrive so soon after, that it is impossible for a spectator to decide which is first in point of time.

The first form of this instrument for measuring the degrees of heat and cold, was the air-thermometer. It is a well known fact that air expands with heat so as to occupy more space than it does when cold, and that it is condensed by cold so as to occupy less space than when warmed, and that this expansion and condensation is greater or less according to the degree of heat or cold applied. The principle then on which the air-thermometer was constructed is very simple. The air was confined in a tube by means of some coloured liquor; the liquor rose or fell according as the air became expanded or condensed. What the first form of the tube was, cannot now perhaps be well known; but the following description of the air-thermometer will fully explain its nature.

The air-thermometer consists of a glass tube BE, connected

nected at one end with a large glass ball A, and at the other end immersed in an open vessel, or terminating in a ball DE, with a narrow orifice at D; which vessel, or ball, contains any coloured liquor that will not easily freeze. Aquafortis tinged of a fine blue colour with a solution of vitriol or copper, or spirit of wine tinged with cochineal, will answer this purpose. But the ball A must be first moderately warmed so that a part of the air contained in it may be expelled through the orifice D; and then the liquor pressed by the weight of the atmosphere will enter the ball DE, and rise, for example, to the middle of the tube at C, at a mean temperature of the weather; and in this state the liquor by its weight, and the air included in the ball A, &c. by its elasticity, will counterbalance the weight of the atmosphere. As the surrounding air becomes warmer, the air in the ball and upper part of the tube, expanding by heat, will drive the liquor into the lower ball, and consequently its surface will descend; on the contrary, as the ambient air becomes colder, that in the ball is condensed, and the liquor pressed by the weight of the atmosphere will ascend: so that the liquor in the tube will ascend or descend more or less according to the state of the air contiguous to the instrument. To the tube is affixed a scale of the same length, divided upwards and downwards from the middle C into 100 equal parts, by means of which the ascent and descent of the liquor in the tube, and consequently the variations in the cold or heat of the atmosphere, may be observed.

This instrument was extremely defective; for the air in the tube was not only affected by the heat and cold of the atmosphere, but also by its weight.

The air being found improper for measuring with accuracy the variations of heat and cold according to the form of the thermometer which was first adopted, another fluid was proposed about the middle of the 17th century by the Florentine academy. This fluid was spirit of wine, or alcohol, as it is now generally named. The alcohol being coloured, was included in a very fine cylindrical glass tube previously exhausted of its air, having a hollow ball at one end A, and hermetically sealed at the other end D. The ball and tube are filled with rectified spirit of wine to a convenient height, as to C, when the weather is of a mean temperature, which may be done by inverting the tube into a vessel of stagnant coloured spirit, under a receiver of the air-pump, or in any other way. When the thermometer is properly filled, the end D is heated red hot by a lamp, and then hermetically sealed, leaving the included air of about $\frac{1}{3}$ of its natural density, to prevent the air which is in the spirit from dividing it in its expansion. To the tube is applied a scale, divided from the middle, into 100 equal parts, upwards and downwards.

As spirit of wine is capable of a very considerable degree of rarefaction and condensation by heat and cold, when the heat of the atmosphere increases the spirit dilates, and consequently rises in the tube; and when the heat decreases, the spirit descends, and the degree or quantity of the motion is shown by a scale.

The spirit of wine thermometer was not subject to some of the inconveniences which attended the air thermometer. In particular, it was not affected by variations in the weight of the atmosphere: accordingly it soon came into general use among philosophers. It was, at an early period, introduced into Britain by Mr Boyle. To this instrument, as then used, there are, however, many objections. The liquor was of different degrees of strength, and therefore different tubes filled with it, when exposed to the same degree of heat, would not correspond. There was also another defect: The scale which was adjusted to the thermometer did not commence at any fixed point. The highest term was ad-

justed to the great sunshine heats of Florence, which are too variable and undetermined; and frequently the workman formed the scale according to his own fancy. While the thermometer laboured under such disadvantages it could not be of general use.

To obtain some fixed unalterable point by which a determined scale might be discovered, to which all thermometers might be accurately adjusted, was the subject which next drew the attention of philosophers. Mr Boyle, who seems at an early period to have studied this subject with much anxiety, proposed the freezing of the essential oil of anniseeds as a convenient point for graduating thermometers; but this opinion he soon laid aside. Dr Halley next proposed that thermometers should be graduated in a deep pit under ground, where the temperature both in winter and summer is pretty uniform; and that the point to which the spirit of wine should rise in such a subterraneous place should be the point from which the scale should commence. But this proposal was evidently attended with such inconveniences that it was soon abandoned. He made experiments on the boiling point of water, of mercury, and of spirit of wine; and he seems rather to give a preference to the spirit of wine. He objected to the freezing of water as a fixed point, because he thought that it admitted considerable latitude.

It seems to have been reserved to the all-conquering genius of Sir Isaac Newton to determine this important point, on which the accuracy and value of the thermometer depends. He chose, as fixed, those points at which water freezes and boils; the very points which the experiments of succeeding philosophers have determined to be the most fixed and convenient. Sensible of the disadvantages of spirit of wine, he tried another liquor which was homogeneous enough, capable of a considerable rarefaction, about 15 times greater than spirit of wine. This was linseed oil. It has not been observed to freeze even in very great colds, and it bears a heat about four times that of water before it boils. With these advantages it was made use of by Sir Isaac Newton, who discovered by it the comparative degree of heat for boiling water, melting wax, boiling spirit of wine, and melting tin; beyond which it does not appear that this thermometer was applied. The method he used for adjusting the scale of this oil thermometer was as follows: Supposing the bulb, when immersed in thawing snow, to contain 10,000 parts, he found the oil expand by the heat of the human body so as to take up $\frac{1}{3}$ more space, or 13,256 such parts; and by the heat of water boiling strongly 10,725; and by the heat of melting tin 11,516. So that reckoning the freezing point as a common limit between heat and cold, he began his scale there, marking it 0, and the heat of the human body he made 12°: and consequently, the degrees of heat being proportional to the degrees of rarefaction, or 256 : 725 :: 12 : 34, this number 34 will express the heat of boiling water; and by the same rule, 72 that of melting tin. This thermometer was constructed in 1701.

To the application of oil as a measure of heat and cold, there are innumerable objections. It is so viscid, that it adheres too strongly to the sides of the tube. On this account it ascends and descends too slowly in case of a sudden heat or cold. In a sudden cold, so great a portion remains adhering to the sides of the tube after the rest has subsided, that the surface appears lower than the corresponding temperature of the air requires. An oil thermometer is therefore not a proper measure of heat and cold.

All the thermometers hitherto proposed were liable to many inconveniences, and could not be considered as exact standards for pointing out the various degrees of temperature. This led Reaumur to attempt a new one, an account of which was published in the year 1730 in the Me-

moirs of the Academy of Sciences. This thermometer was made with spirit of wine. He took a large ball and tube, the dimensions and capacities of which were known; he then graduated the tube, so that the space from one division to another might contain 1000th part of the liquor; the liquor containing 1000 parts when it stood at the freezing point. He adjusted the thermometer to the freezing point by an artificial congelation of water: then putting the ball of his thermometer and part of the tube into boiling water, he observed whether it rose 80 divisions: if it exceeded these, he changed his liquor, and by adding water lowered it, till upon trial it should just rise 80 divisions; or if the liquor, being too low, fell short of 80 divisions, he raised it by adding rectified spirit to it. The liquor thus prepared suited his purpose, and served for making a thermometer of any size, whose scale would agree with his standard.

10
Its defects.

This thermometer was far from being perfect. As the bulbs were three or four inches in diameter, the surrounding ice would be melted before its temperature could be propagated to the whole spirits in the bulb, and consequently the freezing point would be marked higher than it should be. Dr Martine accordingly found, that instead of coinciding with the 32d degree of Fahrenheit, it corresponded with the 34th, or a point a little above it. Reaumur committed a mistake also respecting the boiling point; for he thought that the spirit of wine, whether weak or strong, when immerged in boiling water, received the same degree of heat with the boiling water. But it is well known that highly rectified spirit of wine cannot be heated much beyond the 175th degree of Fahrenheit, while boiling water raises the quicksilver 37 degrees higher. There is another thermometer that goes by the name of *Reaumur's*, which shall be afterwards described.

11
Mercurial
thermometers.

At length a different fluid was proposed, by which thermometers could be made free from most of the defects hitherto mentioned. This fluid was mercury, and seems first to have occurred to Dr Halley in the last century; but was not adopted by him on account of its having a smaller degree of expansibility than the other fluids used at that time*. Boerhaave says that the mercurial thermometer was first constructed by Olaus Roemer; but the honour of this invention is generally given to Fahrenheit of Amsterdam, who presented an account of it to the Royal Society of London in 1724.

Phil.
Transf. vol.
vii. or
Astr. vol. ii.

That we may judge the more accurately of the propriety of employing mercury, we will compare its qualities with those of the fluids already mentioned, air, alcohol, and oil.

Thermometer

Air is the most exansible fluid, but it does not receive nor part with its heat so quickly as mercury. Alcohol does not expand much by heat. In its ordinary state it does not bear a much greater heat than 175° of Fahrenheit; but when highly rectified it can bear a greater degree of cold than any other liquor hitherto employed as a measure of temperature. At Hudson's Bay, Mr Macnab, by a mixture of vitriolic acid and snow, made it to descend to 69 below 0 of Fahrenheit. Here is an inconvenience, however, attending the use of this liquor; it is not possible to get it always of the same degree of strength. As to oil, its expansion is about 15 times greater than that of alcohol; it sustains a heat of 600°, and its freezing point is so low that it has not been determined; but its viscosity renders it useless.

12
Properties of air, alcohol, and oil.

Mercury is far superior to alcohol and oil, and is much more manageable than air. 1. As far as the experiments already made can determine, it is of all the fluids hitherto employed in the construction of thermometers, that which measures most exactly equal differences of heat by equal differences of its bulk: its dilatations are in fact very nearly proportional to the augmentations of heat applied to it (A). 2. Of all liquids it is the most easily freed from air. 3. It is fitted to measure high degrees of heat and cold. It sustains a heat of 600° of Fahrenheit's scale, and does not congeal till it fall 39 or 40 degrees below c. 4. It is the most sensible of any fluid to heat and cold, even air not excepted. † Sir Benjamin Thompson, now Count Rumford, found that mercury was heated from the freezing to the boiling point in 58 seconds, while water took two minutes 13 seconds, and common air 10 minutes and 17 seconds. 5. Mercury is a homogeneous fluid, and every portion of it is equally dilated or contracted by equal variations of heat. Any one thermometer made of pure mercury is, *ceteris paribus*, possessed of the same properties with every other thermometer made of pure mercury. Its power of expansion is indeed about six times less than that of spirit of wine, but it is great enough to answer most of the purposes for which a thermometer is wanted.

13
Thermometrical properties of mercury

Researches sur les propriétés de l'Atmosphère.

Phil. Transf. 1786.

The fixed points which are now universally chosen for adjusting points.

(A) We have affirmed that the expansions of the bulk of quicksilver by heat are nearly (for they are not strictly so) in a regular arithmetical progression, according to the quantity of heat it is exposed to; and such seems to be the case according to the Table published by Mr de Luc, at page 309. of his first volume on the Modifications of the Atmosphere. The following extract of this table shows these variations: and the first and second differences are added, in order to render these irregularities more sensible. They are such as can hardly be conceived from the nature of any substance, without the influence of extraneous and accidental causes, which may have escaped the attention of the observer; neither have they been found exactly true by Dr Crawford. Mr de Luc supposes the whole heat from melting ice to that of boiling water to be divided into 80 parts; by the fractional subdivisions of which he expresses the absolute quantities of heat, answering to each 5, or 10 degrees of Reaumur's thermometer (= 22,5 of Fahrenheit's scale); so that the whole sum of these fractions amounts exactly to the assumed number 80. They are as follow:

Cronstedt's Mineralogy vol. ii.

Reaumur's Thermometer.	Fahrenheit's Thermometer.	Quantities of heat.	First differences.	Second differences.
Degrees 80	212			
70	189,5	9,44	,16	
60	167	9,60	,10	+ ,06
50	144,5	9,70	,16	- ,06
40	122	9,86	,22	- ,06
30	99,5	10,08	,12	+ ,10

0	32	10,74		

adjusting thermometers to a scale, and to one another, are the boiling and freezing water points. The boiling water point, it is well known, is not an invariable point, but varies some degrees according to the weight and temperature of the atmosphere. In an exhausted receiver, water will boil with a heat of 93° or 100°; whereas in Papin's digester it will acquire a heat of 412. Hence it appears that water will boil at a lower point, according to its height in the atmosphere, or to the weight of the column of air which presses upon it. In order to ensure uniformity therefore in the construction of thermometers, it is now agreed that the bulb of the tube be plunged in the water when it boils violently, the barometer standing at 30 English inches (which is its mean height round London), and the temperature of the atmosphere 55°. A thermometer made in this way, with its boiling point at 212°, is called by Dr Horsley *Bird's Fahrenheit*, because Mr Bird was the first person who attended to the state of the barometer in constructing thermometers.

As artists may be often obliged to adjust thermometers under very different pressures of the atmosphere, philosophers have been at pains to discover a general rule which might be applied on all occasions. M. de Luc, in his *Recherches sur les Mod. de l'Atmosphère* from a series of experiments, has given an equation for the allowance on account of this difference, in Paris measure, which has been verified by Sir George Schuckburgh & also Dr Horsley, Dr Maskelyne, and Sir George Schuckburgh, have adapted the equation and rules to English measures, and have reduced the allowances into tables for the use of the artist. Dr Horsley's rule, deduced from De Luc's, is this:

$$\frac{99}{892000} \log_2 z - 92.804 = b.$$

where *b* denotes the height of a thermometer plunged in boiling water, above the point of melting ice, in degrees of Bird's Fahrenheit, and *z* the height of the barometer in 10ths of an inch. From this rule he has computed the following table, for finding the heights, to which a good Bird's Fahrenheit will rise when plunged in boiling water, in all states of the barometer, from 27 to 31 English inches; which will serve, among other uses, to direct instrument-makers in making a true allowance for the effect of the variation of the barometer, if they should be obliged to finish a thermometer at a time when the barometer is above or below 30 inches; though it is best to fix the boiling point when the barometer is at that height.

Equation of the Boiling Point.

Barometer.	Equation.	Difference.
31.0	+ 1.57	0.78
30.5	+ 0.79	0.79
30.0	0.00	0.80
29.5	- 0.80	0.82
29.0	- 1.62	0.83
28.5	- 2.45	0.85
28.0	- 3.31	0.86
27.5	- 4.16	0.88
27.0	- 5.04	

The numbers in the first column of this table express heights of the quicksilver in the barometer in English inches and decimal parts: the second column shows the equation to be applied, according to the sign prefixed, to 212° of Bird's Fahrenheit, to find the true boiling point for every such state of the barometer. The boiling point for all intermediate states of the barometer may be had with sufficient accuracy, by taking proportional parts, by means of the

third column of differences of the equations. See *Phil. Transf.* lxiv. art. 30.; also Dr Maskelyne's *Paper*, vol. lxiv. art. 20.

In the following table we have the result of 15 different observations made by Sir George Schuckburgh compared with the result of M. de Luc's rules.

17

31.0	+ 1.69		+ 1.57	.75

The Royal Society, fully apprized of the importance of adjusting the fixed points of thermometers, appointed a committee of seven gentlemen to consider of the best method for this purpose; and their report is published in the *Phil. Transf.* vol. lxvii. part ii. art. 37.

They observed, that though the boiling point be placed so much higher on some of the thermometers now made than on others, yet this does not produce any considerable error in the observations of the weather, at least in this climate; for an error of 1° in the position of the boiling point, will make an error only of half a degree in the position of 92°, and of not more than a quarter of a degree in the point of 62°. It is only in nice experiments, or in trying the heat of hot liquors, that this error in the boiling point can be of much importance.

In adjusting the freezing as well as the boiling point, the quicksilver in the tube ought to be kept of the same heat as that in the ball. When the freezing point is placed at a considerable distance from the ball, the pounded ice should be piled to such a height above the ball, that the error which can arise from the quicksilver in the remaining part of the tube not being heated equally with that in the ball, shall be very small, or the observed point must be corrected on that account according to the following table:

18
Observations made by a committee of the Royal Society for adjusting the fixed points.

Thermo-
meter.
10
Table for
correcting
the freez-
ing point.

Heat of the Air.	Correction.
42°	,00087
52	,00174
62	,00261
72	,00348
82	,00435

The correction in this table is expressed in 1000th parts of the distance between the freezing point and the surface of the ice: e. g. if the freezing point stands seven inches above the surface of the ice, and the heat of the room is 62, the point of 32° should be placed 7×00261 , or .018 of an inch lower than the observed point. A diagonal scale will facilitate this correction.

20
The quick-
silver in
the tube
ought to
be heated
to the same
degree as
that in the
ball.

The committee observe, that in trying the heat of liquors, care should be taken that the quicksilver in the tube of the thermometer be heated to the same degree as that in the ball; or if this cannot be done conveniently, the observed heat should be corrected on that account; for the manner of doing which, and a table calculated for this purpose, we must refer to their excellent report in the Phil. Trans. vol. lxxvii. part ii. art. 37.

21
The tubes
ought to
be cylindrical
and cap-
illary.

With regard to the choice of tubes, they ought to be exactly cylindrical. But though the diameter should vary a little, it is easy to manage that matter in the manner proposed by the Abbé Nollet \parallel , by making a small portion of the quicksilver, e. g. as much as fills up an inch or half an inch, slide backward and forward in the tube; and thus to find the proportions of all its inequalities, and from thence to adjust the divisions to a scale of the most perfect equality. The capillary tubes are preferable to others, because they require smaller bulbs, and they are also more sensible, and less brittle. The most convenient size for common experiments has the internal diameter about the 40th or 50th of an inch, about 9 inches long, and made of thin glass, that the rise and fall of the mercury may be better seen.

\parallel *Lectures de
Phys. Exp.
tom. iv. p.
376.*

22
The num-
ber of de-
grees into
which the
scale ought
to be divid-
ed.

The next thing to be considered, is of what number of degrees or divisions the scale ought to consist, and from what point it ought to commence. As the number of the divisions of the scale is an arbitrary matter, the scales which have been employed differ much from one another in this circumstance. Fahrenheit has made 180 degrees between the freezing and boiling water point. Amontons made 73, and Sir Isaac Newton only 34. There is, however, one general maxim, which ought to be observed: *That such an arithmetical number should be chosen as can easily be divided and subdivided, and that the number of divisions should be so great that there shall seldom be occasion for fractions.* The number 80 chosen by Reaumur answers extremely well in this respect, because it can be divided by several figures without leaving a remainder; but it is too small a number: the consequence of which is, that the degrees are placed at too great a distance from one another, and fractions must therefore be often employed. We think, therefore, that 160 would have been a more convenient number. Fahrenheit's number 180 is large enough, but when divided its quotient soon becomes an odd number.

23
At what
point the
scale ought
to com-
mence.

As to the point at which the scale ought to commence, various opinions have been entertained. If we knew the beginning or lowest degree of heat, all philosophers would agree, that the lowest point of the thermometer ought to be fixed there; but we know neither the lowest nor the highest degrees of heat; we observe only the intermediate parts. All that we can do, then, is to begin it at some invariable

point, to which thermometers made in different places may easily be adjusted. If possible too, it ought to be a point at which a natural well-known body receives some remarkable change from the effects of heat or cold. Fahrenheit began his scale at the point at which snow and salt congeal. Kirwan proposes the freezing point of mercury. Sir Isaac Newton, Hales, and Reaumur adopted the freezing point of water. The objection to Fahrenheit's lowest point is, that it commences at an artificial cold never known in nature, and to which we cannot refer our feelings, for it is what few can ever experience. There would be several great advantages gained, we allow, by adopting the freezing point of mercury. It is the lowest degree of cold to which mercury can be applied as a measure; and it would render unnecessary the use of the signs plus and minus, and the extension of the scale below 0. But we object to it, that it is not a point well known; for few, comparatively speaking, who use thermometers, can have an opportunity of seeing mercury congeal. As to the other advantage to be gained by adopting the freezing point of mercury, namely, the abolition of negative numbers, we do not think it would counterbalance the advantage to be enjoyed by using a well-known point. Besides, it may be asked, Is there not a propriety in using negative numbers to express the degree of cold, which is a negative thing? Heat and cold we can only judge of by our feelings: the point then at which the scale should commence, ought to be a point which can form to us a standard of heat and cold; a point familiar to us from being one of the most remarkable that occurs in nature, and therefore a point to which we can with most clearness and precision refer to in our minds on all occasions. This is the freezing point of water chosen by Sir Isaac Newton, which of all the general changes produced in nature by cold is the most remarkable. It is therefore the most convenient point for the thermometers to be used in the temperate and frigid zones; we may say over the globe, for even in the hottest countries of the torrid zone many of the mountains are perpetually covered with snow.

Having now explained the principles of the thermometer as fully as appears necessary, in order to make it properly understood, we will now subjoin an account of those thermometers which are at present in most general use. These are Fahrenheit's, De l'Isle's, Reaumur's, and Celsius's. Fahrenheit's is used in Britain, De l'Isle's in Russia, Reaumur's in France, and Celsius's in Sweden. They are all mercurial thermometers.

Fahrenheit's thermometer consists of a slender cylindrical tube and a small longitudinal bulb. To the side of the tube is annexed a scale which Fahrenheit divided into 600 parts, beginning with that of the severe cold which he had observed in Iceland in 1709, or that produced by surrounding the bulb of the thermometer with a mixture of snow or beaten ice and sal ammoniac or sea salt. This he apprehended to be the greatest degree of cold, and accordingly he marked it, as the beginning of his scale, with 0; the point at which mercury begins to boil, he conceived to show the greatest degree of heat, and this he made the limit of his scale. The distance between these two points he divided into 600 equal parts or degrees; and by trials, he found that the mercury stood at 32 of these divisions, when water just begins to freeze, or snow or ice just begins to thaw; it was therefore called the degree of the freezing point. When the tube was immersed in boiling water, the mercury rose to 212, which therefore is the boiling point, and is just 180 degrees above the former or freezing point. But the present method of making the scale of these thermometers, which is the sort in most common use, is first to immerse the bulb of the thermometer in ice or snow

now just beginning to thaw, and mark the place where the mercury stands with a 32; then immerse it in boiling water, and again mark the place where the mercury stands in the tube, which mark with the num. 212, exceeding the former by 180; dividing therefore the intermediate space into 180 equal parts, will give the scale of the thermometer, and which may afterwards be continued upwards and downwards at pleasure.

Other thermometers of a similar construction have been accommodated to common use, having but a portion of the above scale. They have been made of a small size and portable form, and adapted with appendages to particular purposes; and the tube with its annexed scale has often been enclosed in another thicker glass tube, also hermetically sealed, to preserve the thermometer from injury. And all these are called *Fahrenheit's thermometers*.

In 1733, M. De l'Isle of Petersburg constructed a mercurial thermometer on the principles of Reaumur's spirit thermometer. In his thermometer, the whole bulk of quicksilver, when immersed in boiling water, is conceived to be divided into 100,000 parts; and from this one fixed point the various degrees of heat, either above or below it, are marked in these parts on the tube or scale, by the various expansion or contraction of the quicksilver, in all imaginable varieties of heat.—Dr Martine apprehends it would have been better if De l'Isle had made the integer 100,000 parts, or fixed point, at freezing water, and from thence computed the dilatations or condensations of the quicksilver in those parts; as all the common observations of the weather, &c. would have been expressed by numbers increasing as the heat increased, instead of decreasing, or counting the contrary way. However, in practice it will not be very easy to determine exactly all the divisions from the alteration of the bulk of the contained fluid. And besides, as glass itself is dilated by heat, though in a less proportion than quicksilver, it is only the excess of the dilatation of the contained fluid above that of the glass that is observed; and therefore if different kinds of glass be differently affected by a given degree of heat, this will make a seeming difference in the dilatations of the quicksilver in the thermometers constructed in the Newtonian method, either by Reaumur's rules or De l'Isle's. Accordingly it has been found, that the quicksilver in De l'Isle's thermometers has stood at different degrees of the scale when immersed in thawing snow: having stood in some at 154°, while in others it has been at 156° or even 158°.

The thermometer presently used in France is called *Reaumur's*; but it is very different from the one originally invented by Reaumur in 1730, and described in the Memoirs of the Academy of Sciences. The one invented by Reaumur was filled with spirit of wine; and tho' its scale was divided by the author into 80 parts, of which 0 was the freezing point and 80 the boiling water point, yet in fact 80 was only the boiling point of the spirit of wine that he employed, which, as Dr Martine computes, corresponded with 180 of Fahrenheit. But the thermometer now in use in France is filled with mercury; and the boiling water point, which is at 80, corresponds with the 212th degree of Fahrenheit. The scale indeed commences at the freezing point, as the old one did. The new thermometer ought more properly to be called *De Luc's thermometer*, for it was first made by De Luc; and is in fact as different from Reaumur's as it is from Sir Isaac Newton's. When De Luc had fixed the scale, and finished an account of it, he showed the manuscript to M. De la Condamine. Condamine advised him to change the number 80; remarking, that such was the inattention of physicians, that they would probably confound it with Reaumur's. De Luc's modesty, as well as a predilection

for the number 80, founded, as he thought, on philosophical reasons, made him decline following this advice. But he found by experience that the prediction of Condamine was too well founded.

The thermometer of Celsius, which is used in Sweden, has a scale of 100 degrees from the freezing to the boiling water point.

These are the principal thermometers now used in Europe; and the temperatures indicated by any of them may be reduced into the corresponding degrees on any of the others by means of the following simple canons; in which R signifies the degrees on the scale of Reaumur, F those of Fahrenheit, and S those of the Swedish thermometer.

1. To convert the degrees of Reaumur into those of Fahrenheit; $\frac{R \times 9}{4} + 32 = F$.

2. To convert the degrees of Fahrenheit into those of Reaumur; $\frac{F - 32 \times 4}{9} = R$.

3. To convert the Swedish degrees into those of Fahrenheit; $\frac{S \times 9}{5} + 32 = F$.

4. To convert Fahrenheit's into Swedish; $\frac{F - 32 \times 5}{9} = S$.

5. To convert Swedish degrees into those of Reaumur; $\frac{S \times 4}{5} = R$.

6. To convert Reaumur's degrees into Swedish; $\frac{R \times 5}{4} = S$.

To such readers as are unacquainted with the algebraic expression of arithmetical formulae, it will be sufficient to express one or two of these in words to explain their use.—

1. Multiply the degree of Reaumur by 9, divide the product by 4, and to the quotient add 32, the sum expresses the degree on the scale of Fahrenheit.—2. From the degree of Fahrenheit subtract 32, multiply the remainder by 4, and divide the product by 9, the quotient is the degree according to the scale of Reaumur, &c.

As many other thermometers have been used besides these, and consequently observations taken by them, it is of importance to have them placed in such a point of view that they may be easily compared with any of these four now in general use. We therefore give them in Plate DVIII. in the same order as they were arranged by Dr Martine in his valuable Essay on the Construction and Graduation of Thermometers, and at the same time adding those of Celsius and De Luc. We call it by the name of De Luc for the sake of distinguishing it from Reaumur's spirit of wine thermometer, which may be seen in the same Plate.

It is unnecessary to describe any of these more minutely, as they are no longer used. Those who wish to read a more particular account of them may consult Dr Martine's Essays.

As in meteorological observations it is necessary to attend to the greatest rise and fall of the thermometer, attempts have been made to construct a thermometer which might register the greatest degree of heat, or greatest degree of cold, which took place during the absence of the observer. In 1757 Lord Charles Cavendish presented to the Royal Society of London a thermometer in two different forms; the one contrived to mark the greatest degree of heat, and the other the greatest degree of cold.

The first consists of a glass tube AB, with a cylindrical bulb B at the lower end, and capillary at the top, over which there is fixed a glass ball C. The bulb and part of the tube are filled with mercury, the top of which shows the

Thermo-
meter

degrees of heat as usual. The upper part of the tube above the mercury is filled with spirit of wine; the ball C is also filled with the same liquor almost to the top of the capillary tube. When the mercury rises the spirit of wine is also raised, and falls into the ball C, which is so made that the liquor cannot return into the tube when the mercury sinks; consequently the height of the spirit of wine in the ball, added to that in the tube, will give the greatest degree of heat to which the thermometer has pointed since last observation. When a new observation is to be made, the instrument must be inclined till the liquor in the ball cover the end of the capillary tube.

In this thermometer it is evident that the mercury must be affected by the weight and elasticity of the spirit of wine, and therefore it will not correspond to any of the common mercurial thermometers.

The thermometer for showing the greatest degree of cold is represented in fig. 4. by the crooked tube ABCD. This instrument is filled with spirit of wine, with the addition of as much mercury as is sufficient to fill both legs of the siphon, and about a fourth or fifth part of the hollow ball C. We are not told what the proportion of mercury was to that of spirit of wine. The degrees of heat are shown by the rise or fall of the mercury in the leg AB. The thermometer marks the greatest fall by means of the hollow ball C. When the mercury in the longer leg sinks by cold, that in the shorter will rise and run over into the ball C, from which it cannot return when the mercury subsides in the shorter and rises in the longer leg. The upper part of the shorter leg will therefore be filled with a column of spirits of a length proportional to the increase of heat; the bottom or lower surface of which, by means of a proper scale, will show how much the mercury has been lower than it is; which being subtracted from the present height will give the lowest point to which the mercury has fallen. That the thermometer may be fitted for a new observation, the mercury must be made to run back from the ball into the shorter leg, by inclining the tube and heating the ball.

31
Mr Six's
thermome-
ter.

Fig. 5.

In 1782 Mr Six proposed another self-registering thermometer. It is properly a spirit of wine thermometer, though mercury is also employed for supporting an index. *ab* is a thin tube of glass 16 inches long, and $\frac{1}{15}$ ths of an inch caliber: *cde* and *fgb* are smaller tubes about $\frac{1}{20}$ th of an inch caliber. These three tubes are filled with highly rectified spirit of wine, except the space between *d* and *g*, which is filled with mercury. As the spirit of wine contracts or expands in the middle tube, the mercury falls or rises in the outside tubes. An index, such as that represented in fig. 6. is placed on the surface, within each of these tubes, so light as to float upon it. *k* is a small glass tube $\frac{1}{4}$ ths of an inch long, hermetically sealed at each end, and inclosing a piece of steel wire nearly of its own length. At each end *l, m*, of this small tube, a short tube of black glass is fixed, of such a diameter as to pass freely up and down within either of the outside tubes of the thermometer *ce* or *fb*. From the upper end of the index is drawn a spring of glass to the fineness of a hair, and about $\frac{1}{4}$ ths of an inch long; which being placed a little oblique, presses lightly against the inner surface of the tube, and prevents the index from descending when the mercury descends. These indexes being inserted one into each of the outside tubes, it is easy to understand how they point out the greatest heat or cold that has happened in the observer's absence. When the spirit of wine in the middle tube expands, it presses down the mercury in the tube *bf*, and consequently raises it in the tube *ec*; consequently the index on the left hand tube is left behind and marks the greatest cold, and

the index in the right hand tube rises and marks the greatest heat.

In 1790 a paper was given into the Royal Society of Edinburgh, describing two thermometers, newly invented, by Dr John Rutherford of Middle Bailish; the one for registering the highest and the other for registering the lowest degree of heat to which the thermometer has risen or fallen during the absence of the observer. An account of them may be found in the third volume of the Transactions of the Society.

A new self-registering thermometer has more lately been invented by Mr Keith of Ravelstone, which we consider as the most ingenious, simple, and perfect, of any which has hitherto appeared. Its simplicity is so great, that it requires only a very short description to make it intelligible.

AB is a thin glass tube about 14 inches long and $\frac{1}{4}$ ths of an inch caliber, close or hermetically sealed at top. To the lower end, which is open, there is joined the crooked glass tube BE, seven inches long, and $\frac{1}{10}$ ths of an inch caliber, and open at top. The tube AB is filled with the strongest spirit of wine, and the tube BE with mercury. This is properly a spirit of wine thermometer, and the mercury is used merely to support a piece of ivory or glass, to which is affixed a wire for raising one index or depressing another, according as the mercury rises or falls. E is a small conical piece of ivory or glass, of such a weight as to float on the surface of the mercury. To the float is joined a wire called the *float-wire*, which reaches upwards to H, where it terminates in a knee bent at right angles. The float-wire, by means of an eye at *a*, moves easily along the small harpichord wire GK. LL are two indexes made of thin black oiled silk, which slide upwards or downwards with a force not more than two grains. The one placed above the knee points out the greatest rise, and the one placed below it points out the greatest fall, of the thermometer.

When the instrument is to be prepared for an observation, both indexes are to be brought close to the knee H. It is evident, that when the mercury rises, the float and float wire, which can be moved with the smallest force, will be pushed upwards till the mercury become stationary. As the knee of the float-wire moves upwards it will carry along with it the upper index L. When the mercury again subsides, it leaves the index at the highest point to which it was raised, for it will not descend by its own weight: As the mercury falls the float-wire does the same; it therefore brings along with it the lower index L, and continues to depress it till it again become stationary or ascend in the tube; in which case it leaves the lower index behind it as it had formerly left the upper. The scale to which the indexes point is placed parallel to the slender harpichord wire. It may be seen more distinctly in fig. 8. That the scale and indexes may not be injured by the wind and rain, a cylindrical glass cover, close at top, and made so as to exactly fit the part FG, is placed over it.

The ingenious inventor has another improvement in contemplation, which, if upon trial it be found to answer, will make this thermometer as perfect as can be desired, provided there do not arise some errors from the variable pressure of the atmosphere. He proposes to adopt clock-work to this thermometer, in such a way as to register with the utmost precision the degrees of heat and cold for every month, day, and minute in the year. The principles on which this clockwork is to be formed we shall forbear to describe, hoping that the author himself, after his experiment has met with the success which we ardently wish, will favour the world with his own account of it.

The same ingenious gentleman has invented a self-registering barometer, upon the same principles with his self-registering thermometer. We have had the pleasure of seeing both; and are convinced that they will fully gratify the wishes of all who are engaged in meteorological studies. He is also in expectation of being soon able to produce an air-thermometer free from the defects of those which were formerly made, as he has found out a way of preventing it from being affected by the pressure of the atmosphere.

M. De Luc has described the best method of constructing a thermometer, fit for determining the temperature of the air, in the mensuration of heights by the barometer. He has also shown how to divide the scale of a thermometer, so as to adapt it for astronomical purposes in the observation of refractions.

Mr Cavallo, in 1781, proposed the construction of a thermometrical barometer, which, by means of boiling water, might indicate the various gravity of the atmosphere, or the height of the barometer. But as he does not say that the instrument has been tried with the desired success, we forbear to describe it. Those who wish to know his ideas respecting it may consult the Philosophical Transactions, vol. lxxi. p. 524.

The thermometers hitherto described are very limited in their extent; they indeed point out to us the lowest degrees of heat which are commonly observed even in cold climates, but they by no means reach to those degrees of heat which are very familiar to us. The mercurial thermometer extends no farther than to 600 of Fahrenheit's scale, the heat of boiling mercury; but we are sure that the heat of solid bodies, when heated to ignition, or till they emit light, far exceeds the heat of boiling mercury.

In order to remedy this defect, Sir Isaac Newton, whose genius overcame those obstacles which ordinary minds could not approach, attempted by an ingenious experiment to extend the scale to any degree required. Having heated a mass of iron red-hot, and exposed it to the cold air, he observed the time which elapsed till it became cold, or of the same temperature with the air; and when the heat so far decreased that he could apply some known measure (as a thermometer) to it, he observed the degrees of heat lost in given times; and thence drew the general conclusion, that the quantities of heat lost in given small spaces are always proportional to the heat remaining in the body, reckoning the heat to be the excess by which it is warmer than the ambient air. So that taking the number of minutes which it took to cool after it came to a determined point in an arithmetical progression, the decrements of the heat of the iron would be continually proportional. Having by this proportion found out the decrements of heat in a given time after it came to a known point, it was easy, by carrying upwards the same proportion to the beginning of its cooling, to determine the greatest heat which the body had acquired. This proportion of Sir Isaac's was found by Dr Martine to be somewhat inaccurate. The heat of a cooling body does not decrease exactly in proportion to that which the body retains. As the result of many observations, he found that two kinds of proportion took place, an arithmetical as well as the geometrical proportion which Sir Isaac Newton had adopted; namely, that the decrements of heat were partly proportional to the times (that is, that quantities of heat are lost in equal times), as well as partly in proportion to the remaining heat; and that if these two are added together the rule will be sufficiently accurate. By the geometrical proportion which Sir Isaac Newton adopted he discovered the heat of metals red-hot or in fusion.

This method, so successfully pursued by Sir Isaac, was sufficient to form a scale of high degrees of heat, but was not convenient for practical purposes. Accordingly the ingenious Mr Josiah Wedgwood, who is well known for his great improvement in the art of pottery, applied himself in order to discover a thermometer which might be easily managed. After many experiments recorded in the Philosophical Transactions, but which it is unnecessary to detail in this place, he has invented a thermometer which marks with much precision the different degrees of ignition from a dull red heat visible in the dark to the heat of an air-furnace. This thermometer is extremely simple. It consists of two rulers fixed upon a smooth flat plate, a little farther asunder at the one end than at the other, leaving an open longitudinal space between them. Small pieces of alum and clay mixed together are made of such a size as just to enter at the wide end; they are then heated in the fire along with the body whose heat we wish to determine. The fire, according to the degree of heat it contains, diminishes or contracts the earthy body, so that when applied to the wide end of the gage, it will slide on towards the narrow end, less or more according to the degree of heat to which it has been exposed.

That this instrument may be perfectly understood, we have given a representation of it in Plate DVI. fig. 9. ABCD is a smooth flat plate; and EF and GH two rulers or flat pieces, a quarter of an inch thick, fixed flat upon the plate, with the sides that are towards one another made perfectly true, a little farther asunder at one end EG than at the other end FH: thus they include between them a long converging canal, which is divided on one side into a number of small equal parts, and which may be considered as performing the offices both of the tube and scale of the common thermometer. It is obvious, that if a body, so adjusted as to fit exactly at the wider end of this canal, be afterwards diminished in its bulk by fire, as the thermometer pieces are, it will then pass further in the canal, and more and more so according as the diminution is greater; and conversely, that if a body, so adjusted as to pass on to the narrow end, be afterwards expanded by fire, as is the case with metals, and applied in that expanded state to the scale, it will not pass so far; and that the divisions on the side will be the measures of the expansions of the one, as of the contractions of the other, reckoning in both cases from that point to which the body was adjusted at first.

It is the body whose alteration of bulk is thus to be measured. This is to be gently pushed or slid along towards the end FH, till it is stopped by the converging sides of the canal.

Mr Wedgwood at first used clay for his thermometer pieces; but he soon found it impossible to procure fresh supplies of the same quality. He therefore had recourse to an artificial preparation. As the earth of alum is the pure argillaceous earth to which all clays owe their property of diminishing in the fire, he mixed some of this earth with the clay, and found it to answer his wishes completely, both in procuring the necessary degree of diminution and of increasing its unvitrescibility. The only way of ascertaining the proportion of alum earth to be added is by repeated trials. Mr Wedgwood found that to hundred weight of the porcelain clay of Cornwall required all the earth that was afforded by five hundred weight of alum. But as the clay or alum differs in quality, the proportion will also differ. There can now, however, be no difficulty in making thermometers of this kind, as common clay answers the purpose very well, and alum-earth can easily be procured. Those who wish to see a more particular account of this subject may peruse Mr Wedgwood's

Thermometer. papers in the Philosophical Transactions for 1782, 1784, and 1786.

As Mr Wedgwood's thermometer begins at the lowest degree of ignition, and Fahrenheit's goes no higher than the boiling point of mercury, Mr Wedgwood continued to fill up the interval of the scale by using a piece of silver instead of his common thermometer pieces; and in this way he has found out that 130 degrees of Fahrenheit are equal to one of his. He has accordingly, by observing this proportion, continued Fahrenheit's scale to the top of his own. We are now therefore enabled to give a scale of heat from the highest degree of heat produced by an air furnace to the greatest degree of cold hitherto known, which was produced at Hudson's Bay in December 1784 by a mixture of vitriolic acid and snow. Of the remarkable degrees between these extreme points we shall now lay before our readers a scale.

	Fahrenheit's scale.	Wedgwood's scale.
Extremity of Wedgwood's scale	32277°	240°
Greatest heat of his small air-furnace	21877	160
Cast iron melts	17977	130
General heat of a common smith's sforge	17327	125
Welding heat of iron, greatest	13427	95
----- least	12777	90
Fine gold melts	5237	32
Fine silver melts	4717	28
Swedish copper melts	4587	27
Brass melts	3807	21
Heat by which his enamel colours are burnt on	1857	6
Red heat fully visible in day-light	1077	0
Red-heat fully visible in the dark	947	1
MERCURY BOILS, also lintseed and other expressed oils	600	
Oil of turpentine boils	560	
Sulphuric acid boils	546	
Lead melts	540	
Bismuth melts	460	
Tin melts	408	
Sulphur melts	244	
Nitrous acid boils	242	
Cows milk boils	213	
WATER BOILS	212	
Human urine boils	206	
Brandy boils	190	
Alcohol boils	174	
Serum of blood and white of eggs harden	156	
Bees wax melts	142	
Heat of the air near Senegal sometimes	111	
Hens hatch eggs about	108	
Heat of birds from	103 to 111	
Heat of domestic quadrupeds from	100 to 103	
Heat of the human body	92 to 99	
Heat of a swarm of bees	97	
Heat of the ocean under the equator	80	
Butter melts	74	
Vitriolic acid of the specific gravity of 1780 freezes at	45	
Oil of olives begins to congeal	43	
Heat of hedgehogs and marmots in a torpid state	39½	
WATER FREEZES and snow melts	32	
Milk freezes	30	
Urine and common vinegar freezes	28	
Human blood freezes	25	
Strong wines freeze	20	

Fahrenheit's scale,

Therm. Pylæ & Thefeus

A mixture of one part of alcohol and three parts of water freezes	7
A mixture of snow and salt freezes	0 to 4
Brandy, or a mixture of equal parts of alcohol and water, freezes	- 7
Spirit of wine in Reaumur's thermometer froze at Torneo	- 34
MERCURY FREEZES	- 39 or 40
Cold produced by Mr Macnab at Hudson's Bay by a mixture of vitriolic acid and snow	- 69

THERMOPYLÆ, (anc. geog.); a narrow pass or defile, between the wash of the Sinus Maliacus; on the east and steep mountains, reaching to Oeta, made dreadful by unpassable woods; on the west, leading from Thessaly to Locris and Bœotia. These mountains divide Greece in the middle, in the same manner as the Apennine does Italy; forming one continued ridge from Leucate on the west to the sea on the east, with thickets and rocks interperfed; that persons even prepared for travelling, much less an army encumbered with baggage, cannot easily find a commodious passage. In the valley verging towards the Sinus Maliacus, the road is only sixty paces broad; the only military way for an army to pass, if not obstructed by an enemy; and therefore the place is called *Pylæ*, and by others, on account of its hot water, *Thermopylæ*. Ennobled by the brave stand made by Leonidas and three hundred Spartans against the whole army of Persia; and by the bold resolution of blind Euthycus, choosing rather to fall there in fight, than return to Sparta, and escape the common danger. Famous also for the Amphyctiones, the common council or states general of Greece, assembling there twice a year, spring and autumn. For an account of the battle of Thermopylæ at which Leonidas with a handful of men engaged the Persian army, see SPARTA.

THESEA, in antiquity, feasts celebrated by the Athenians in honour of Theseus, consisting of sports and games, with mirth and banquets; such as were poor and unable to contribute to them were entertained at the public expence.

THESEUS, a famous hero of antiquity ranked among the demi-gods, whose history is fabulous. He was the reputed son of Ægeus king of Athens. He threw Sciron, a cruel robber, down a precipice; fastened Procrustes tyrant of Attica to a bending pine, which being let loose tore him asunder; killed the Minotaur kept in the labyrinth by king Minos, in Crete; and by the assistance of that prince's daughter, Ariadne, who gave him a clue, escaped out of that labyrinth, and sailed with his deliverer to the isle of Naxos, where he had the ingratitude to leave her.

Theseus afterwards overcame the Centaurs, subdued the Thebans, and defeated the Amazons. He assisted his friend Pirithous in his expedition to the infernal regions to carry off Proserpine; but was imprisoned by Pluto, till he was released by Hercules. He is also said to have established the Isthmian games, in honour of Neptune; to have united the twelve cities of Attica; and to have founded a republic there, 1236 B. C. So e time after, taking a voyage into Epirus, he was seized by Aidonius king of the Molossians; meanwhile Meneltheus rendered himself master of Athens. But at length Theseus being released from prison, retired to Scyros, where king Lycomedes caused him to be thrown from the top of a rock. Theseus had several wives, the first of whom was Helena the daughter of Tyndarus; the second, Hypolita queen of the Amazons; and the last, Phædra sister to Ariadne, who punished him for

for his infidelity to her sister, by her incestuous passion for his son Hippolitus.

THESIS, a general position which a person advances, and offers to maintain. In taking degrees in universities, the candidates are generally obliged to write a thesis, which they must afterwards defend,

THESIUM, *BASE FLUELLIN*, in botany; a genus of plants belonging to the class of *pentandria*, and order of *monogynia*. The calyx is monophyllous, with the stamina inserted into it: there is only one seed, which is inferior. There are 17 species; one of which is a British plant, the *linophyllum* or bastard toad-flax. It has a foliaceous panicle with linear leaves, and flowers in June and July.

THESPIS, a famous Greek tragic poet, and the first representer of tragedy at Athens. He carried his troop from village to village in a waggon, from which they performed their pieces. *Alcestis* was the first tragedy they performed at Athens, 536 B. C. See **THEATRE**.

THESALIAN Chair, so called from Thessaly, where chairs of this figure were most in use; it is recommended by Hippocrates in place of a machine for reducing a recent luxation of the shoulder bone. The back of this chair is perpendicular to the seat, as Galen tells us; by which construction it is distinguished and accommodated to the operation.

THESSALY, a country of Greece, whose boundaries have been different at different periods. Properly speaking, Thessaly was bounded on the south by the southern parts of Greece, or *Græcia Propria*; east, by the *Ægean*; north, by Macedonia and Myrdonia; and west, by Illyricum and Epirus. It was generally divided into four separate provinces, *Thessaliotis*, *Pelagiotis*, *Ilthæotis*, and *Phthiotis*, to which some add *Magnesia*. It has been severally called *Æmonia*, *Pelagicum*, *Argos*, *Hellas*, *Argeia*, *Dryopis*, *Pelagisia*, *Pyrrhæa*, &c. The name of Thessaly is derived from *Thesalus*, one of its monarchs. Thessaly is famous for a deluge which happened there in the age of Deucalion. Its mountains and cities are also celebrated, such as *Olympus*, *Pelion*, *Ossa*, *Larissa*, &c. The Argonauts were partly natives of Thessaly. The inhabitants of the country passed for a treacherous nation, so that false money was called *Thessalian coin*, and a perfidious action a *Thessalian deceit*. Thessaly was originally governed by kings, till it became subject to the Macedonian monarchs. The cavalry was universally esteemed, and the people were superstitious and addicted to the study of magic and incantations. See *Lucan*. 6. v. 438, &c.; *Dionys*. 219; *Curt*. 3. c. 2; *Ælian*, V. H. 3. c. 1; *Pauf*. 4. c. 36. l. 10. c. 1; *Mela*. 2. c. 3; *Justin* 7. c. 6; *Diod*. 4.

Thessaly is now called *Tanna*, a province of European Turkey, bounded by Macedonia on the north, by the Archipelago on the east, by Achaia or Livadia on the south, and by Epirus on the west.

THETIS, in Pagan mythology, the wife of Oceanus, and the mother of *Nereus* and *Doris*, who were married to each other; and from this marriage sprung the nymphs of the earth and sea. Among the sea nymphs there was one named *Thetis the Younger*, who excelled all the rest in beauty, and for whom Jupiter conceived such a passion, that he resolved to espouse her; but being informed by the *Destinies* that she would bring forth a son who would rise above his father, he married her to *Peleus*. To their nuptials all the gods and goddesses were invited except *Dionys*, who, to be revenged for this contempt, threw a golden apple into the assembly, on which was engraven, *For the fairest*. *Juno*, *Pallas*, and *Venus*, disputed for this apple; but *Pais* being chosen to decide the difference, adjudged it to *Venus*. From this marriage of *Thetis* and *Peleus* sprung *Achilles*.

THEURGY, *θεουργία*, a name which the ancients gave to that sacred part of magic which we sometimes call *white magic*, or the *white art*.

The word is formed from *θεός*, "God," and *εργον*, "work;" *q. d.* the art of doing divine things, or things which God alone can do: or the power of working extraordinary and supernatural things, by invoking the names of God, saints, angels, &c. Accordingly, those who have written of magic in general, divide it into three parts: the first whereof is called *theurgy*, as operating by divine or celestial means; the second, *natural magic*, performed by the powers of nature; and the third, comprehending *necromancy*, *strigery*, and *witchcraft* or *magic*, performed by the assistance of demons or departed men. See **MAGIC**.

THIBET. See **TIBET**.

THIGH, in anatomy. See **ANATOMY**, n° 58.

THINKING, a general name for any act or operation of the mind. See **METAPHYSICS**.

THIRLAGE. See **LAW**, n° clxx. 12—18.

THIRST, an uneasy sensation arising from a deficiency of the saliva to moisten the inward parts of the mouth. Hence arises a strong desire for drink; and thirst is a symptom generally attending fevers of all kinds.—Thirst is best allayed by acids; water kept a while in the mouth, then spit out, and repeated as required; a bit of bread chewed with a little water, which latter may be gradually swallowed; if the person is very hot, brandy is the best for holding in the mouth, but should be spit out again: except in fevers, large draughts of cold water are hurtful.

Preparation against Hunger and Thirst. See **HUNGER**.

THISTLE, a well known weed in corn fields. In Britain there are eight species of thistles according to the vulgar arrangement; the *carduus lanceolatus* or spear-thistle, the nutans or musk-thistle, the palustris or marsh thistle, the marianus or milk-thistle, *acanthoides* or watted-thistle, *crispus* or curled-thistle, *onopordum acanthium* or cotton-thistle, *ferratula arvensis* or corn-thistle. All these, except the last, are annual or biennial, and therefore may be easily destroyed by cutting them down before their seed ripens; but the *ferratula arvensis* is perennial, continues in the earth increasing and throwing up new shoots every year. Mr Curtis ascertained the annual increase of its root, by planting in a garden a piece of the root two inches long and about the thickness of a goose's quill, and a small head of leaves. By the 2d of November the root had extended itself eight feet, and when dug and washed it weighed four pounds.

As to the uses of the thistle, they are not well known. The corn-thistle is eaten by the ass, and formerly was pulled with great care by the farmers in some parts of Scotland as food for their horses. For a botanical description of the different kinds of thistle, see **CARDUS**, **CACTUS**, **DIPSOSAUS**, **ONOPORDUM**, **SERRATULA**, **BONCHUS**.

Order of the THISTLE, or of *St Andrew*, a military order of knighthood in Scotland, the rise and institution of which is variously related by different authors. *Lesley* bishop of Ross reports, that the night before the battle between *Athelstan* king of Northumberland and *Hungus* king of the Picts, a bright cross, in form of that whereon *St Andrew* (the tutelary saint of Scotland) suffered martyrdom, appeared to *Hungus*; who having gained the victory, ever after bore the figure of that cross on his banners. Others assert, that *Achais* king of Scotland first instituted this order, after having made the famous league offensive and defensive with *Chalermagne* king of France. But although the thistle had been acknowledged as the symbol of the kingdom of Scotland from the reign of *Achais*, yet

Thlapi
Thomas. Some refer the beginning of this order to Charles VII. of France. Others place the foundation of it as low as the year 1500.

The chief and principal ensign is a gold collar composed of thistles and sprigs of the interlinked with amulets of gold, having pendent thereto the image of St Andrew with his cross, and the motto, NEMO ME IMPUNE LACESSET. "No body shall provoke me with impunity."

The ordinary or common ensign worn by the knights is a star of four silver points, and over them a green circle, bordered and lettered with gold, containing the said motto, and in the centre is a thistle; all which is embroidered on their left breast, and worn with the collar, with a green riband over the left shoulder, and brought under the right arm; pendent thereto is the image of St Andrew, with his cross, in a purple robe, within an oval of gold enamelled vert, with the former motto; but sometimes they wear, encircled in the same manner, a thistle crowned.

About the time of the Reformation, this order was dropped, till James II. of Great Britain resumed it, by creating eight knights. The Revolution unsettled it again; and it lay neglected, till queen Anne, in 1703, restored it to the primitive design, of twelve knights of St Andrew.

THLAPSI, BASTARD-CRESS, or *mithridate-mustard*, in botany: A genus of plants belonging to the class of *tetradynamia*, and order of *siliquosa*; and in the natural system ranging under the 39th order, *Siliquosa*. The pod is emarginated, obovate, and polyspermous; the valves are boat-shaped and marginato-carinated. There are 12 species; of which six only are natives of Britain, the *arvensis*, *hirtum*, *campstre*, *montanum*, *perfoliatum*, and *bursa pastoris*.

1. The *arvensis*, treacle-mustard or penny-cress, has orbiculate pods, and leaves oblong, smooth, and scalloped. It smells like garlic, and has a white flower. 2. The *hirtum*, or perennial mithridate mustard, has roundish hairy pods; the cauline leaves are sagittate and villous. 3. The *campstre*, or mithridate-mustard, has roundish pods, sagittate leaves, dentated and hairy. 4. *Montanum*, or mountain mithridate mustard, has obovate pods, smooth leaves; the radical leaves somewhat fleshy, obovate and entire; the cauline embracing the stalk, and the corolla being larger than the calyx. 5. The *perfoliatum*, or perfoliate treacle-mustard, has obovate pods; the cauline leaves are smooth and subdentate; the petals of the length of the calyx, and the stalk branchy. 6. The *bursa pastoris*, or shepherd's purse, has obovate pods; the radical leaves are pinnatifid.

The seeds of some of these species have an acrid biting taste, approaching to that of the common mustard; with which they agree nearly in their pharmaceutic properties. They are rarely made use of any otherwise than as ingredients in the compositions whose names they bear; though some recommend them in different disorders, preferably to the common mustard.

THOMÆANS, THOMISTS. See CHRISTIANS of St Thomas.

THOMAS AQUINAS. See AQUINAS.

St THOMAS'S Day, a festival of the Christian church, observed on December 21. in commemoration of St Thomas the apostle.

St THOMAS of Canterbury's Day, a festival of the Romish church, observed on December 29. in memory of Tho-

mas Becket archbishop of Canterbury, who was murdered, or, as the Romanists say, martyred, in the reign of king Henry II.

THOMAS the Reymour, called also *Thomas Lermont*, and *Thomas of Ereldon*, was born at Ereldon, a village near Melrose in Tweeddale, in what year is uncertain; but he was an old man when Edward I. was carrying on war in Scotland.

The character of Lermont as a prophet, and which was common to him with Linus, Orpheus, and other early poets in many countries, arose, if we may believe Mackenzie in his Lives of Scottish Writers, from his having conferences with Eliza, a nun and prophetess at Haddington. Lermont put her predictions into verse, and thus came in for his share of the prophetic spirit. None of these ancient prophecies now remain; but the following, which pretends to be one of them, is given from a manuscript of the time of Edward I. or II. The countess of Dunbar is the lady famous for the defence of her castle against the English. Her proper title was *Countess of March*; but it was common in these times to style a nobleman from his chief residence. Thus Gilbert Strongbow, earl of Pembroke, is called *Earl of Striguil*, from his residence at Striguil castle, near Clephlow, Monmouthshire, &c.

La Countesse de Dunbar demande a Thomas de Effedoune, quant la guerre d'Escoce prendroit fin. E yl l'a repoundy, et dyt.

When man as mad a kyng of a capped mon.
When mon is levere other mons thyng than is owen.
When londe thouys forest, and forest ys felde.
When hars kendles othe herison.
When Wyt and Wille werres togedere.
When mon makes stables of kyrkes; and steles castles wyth flyes.
When Rokefbourh nys no burgh; ant market is at Forwyleye.
When the alde is gan, and the newe is, come that doue noht.
When Bambourne ys donged with dede men.
When men ledes men in ropes to buyen ant to sellen.
When a quarter of whaty whete is chaunged for a colt of ten markes.
When prude prikes, ant pees is leyd in prifoun.
When a Scot ne may hym hude ase hare in forme, that the Englysh ne shal hym fynde.
When ryht ant wrong aittente the togedere.
When laddes weddeth lovedies.
When Scottes sten so taste, that for faute of ship, hy drouneth hemselve.
When shal this be?
Nouther in thine tyme, ne in myne.
Ah comen, ant gone,
Withinne twenty wynter ant on.

In fact, the prophecies of Lermont appear to have been merely traditional; nay, it seems doubtful if he ever pretended to such folly, notwithstanding Mackenzie's story of Eliza. The reverence of the people for a learned and respectable character seems to have been the sole foundation of Thomas's claim to prophecy. But, in the 16th century, prophecies were made, and ascribed to him, as well as others given to Bede, Merlin, &c. (A). They were printed at Edinburgh, 1615, reprinted 1680, and 1742.

THOMISM. See AQUINAS.

THOMSON

(A) Sibilla and Banister Anglicus are mentioned in the time of Edward IV. (MSS Cot. Dom. A IX.) A long Latin prophecy of Bridlington is there given. Waldhave and Eltraîne seem also English prophets. In the whole collection, therefore, Thomas is the only Scottish one.

THOMSON (James), an excellent British poet, the son of a Scotch divine, was born in the shire of Roxburgh in 1700, and was educated in the university of Edinburgh with a view to the ministry. But his genius inclining him to the study of poetry, which he soon found would be incompatible with that of theology, or at least might prevent his being provided for in that way in his own country, he relinquished his views of engaging in the sacred function, and repaired to London in consequence of some encouragement which he had received from a lady of quality there, a friend of his mother.

The reception he met with wherever he was introduced, emboldened him to risk the publication of his excellent poem on Winter.—This piece was published in 1726; and from the universal applause it met with, Mr Thomson's acquaintance was courted by people of the first taste and fashion. But the chief advantage which it procured him was the acquaintance of Dr Rundle, afterward bishop of Derry, who introduced him to the late lord chancellor Talbot; and some years after, when the eldest son of that nobleman was to make his tour on the continent, Mr Thomson was chosen as a proper companion for him. The expectations which his Winter had raised, were fully satisfied by the successive publications of the other seasons; of Summer, in the year 1727; of Spring, in the following year; and of Autumn, in a quarto edition of his works, in 1730. Beside the Seasons, and his tragedy of Sophonisba, written and acted with applause in the year 1729, he had, in 1727, published his poem to the memory of Sir Isaac Newton, with an account of his chief discoveries; in which he was assisted by his friend Mr Gray, a gentleman well versed in the Newtonian philosophy. That same year the resentment of our merchants, for the interruption of their trade by the Spaniards in America, running very high, Mr Thomson zealously took part in it, and wrote his *Britannia*, to rouse the nation to revenge.

With the Honourable Charles Talbot, our author visited most of the courts in Europe, and returned with his views greatly enlarged; not only of exterior nature and the works of art, but of human life and manners, and of the constitution and policy of the several states, their connections, and their religious institutions. How particular and judicious his observations were, we see in his poem on Liberty, begun soon after his return to England. We see at the same time to what a high pitch his care of his country was raised, by the comparisons he had all along been making of our happy government with those of other nations. To inspire his fellow-subjects with the like sentiments, and show them by what means the precious freedom we enjoy may be preserved, and how it may be abused or lost, he employed two years in composing that noble work, upon which he valued himself more than upon all his other writings. On his return to England with Mr Talbot (who soon after died), the chancellor made him his secretary of briefs; a place of little attendance, suiting his retired indolent way of life, and equal to all his wants. From this office he was removed, when death, not long after, deprived him of his noble patron. He then found himself reduced to a state of precarious dependence. In this situation, having created some few debts, and his creditors finding that he had no longer any certain support, became inexorable; and imagined by confinement to force that from his friends, which his modesty would not permit him to ask. One of these occasions furnished Quin, the celebrated actor, with an opportunity of displaying the natural goodness of his heart, and the disinterestedness of his friendship. Hearing that Thomson was confined in a spunging house for a debt of about 70*l.* he repaired to the place; and, having inquired

for him, was introduced to the bard. Thomson was a good deal disconcerted at seeing Quin, as he had always taken pains to conceal his wants; and the more so, as Quin told him he was come to sup with him. His anxiety upon this head was however removed, upon Quin's informing him, that, as he supposed it would have been inconvenient to have had the supper dressed in the place they were in, he had ordered it from an adjacent tavern; and, as a prelude, half a dozen of claret was introduced. Supper being over, and the bottle circulating pretty briskly, Quin said, "It is time now we should balance accounts." This astonished Thomson, who imagined he had some demand upon him; but Quin perceiving it, continued, "Mr Thomson, the pleasure I have had in perusing your works I cannot estimate at less than a hundred pounds, and I insist upon now acquitting the debt." On saying this, he put down a note of that value, and took his leave, without waiting for a reply.

The profits arising from his works were not inconsiderable; his tragedy of *Agamemnon*, acted in 1738, yielded a good sum. But his chief dependence was upon the prince of Wales, who settled on him a handsome allowance, and honoured him with many marks of particular favour. Notwithstanding this, however, he was refused a licence for his tragedy of *Edward and Eleanor*, which he had prepared for the stage in the year 1736, for some political reasons. Mr Thomson's next performance was the *Masque of Alfred*, written in the year 1740 jointly with Mr Mallet, by the command of the prince of Wales, for the entertainment of his royal highness's court at Clifden, his summer residence.

Mr Thomson's poem, entitled the *Castle of Indolence*, was his last work published by himself; his tragedy of *Coriolanus* being only prepared for the theatre, when a fatal accident robbed the world of one of the best of men and best of poets. He would commonly walk the distance between London and Richmond (where he lived) with any acquaintance that offered, with whom he might chat and rest himself, or perhaps dine by the way. One summer evening being alone in his walk from town to Hammermith, he had over-heated himself, and in that condition imprudently took a boat to carry him to Kew; apprehending no bad consequence from the chill air on the river, which his walk to his house, towards the upper end of Kew-lane, had always hitherto prevented. But now the cold had so seized him, that the next day he was in a high fever. This, however, by the use of proper medicines, was removed, so that he was thought out of danger; till the fine weather having tempted him to expose himself once more to the evening dews, his fever returned with violence, and with such symptoms as left no hopes of a cure. His death happened on the 27th of August 1748.

Mr Thomson had improved his taste upon the finest originals, ancient and modern. The autumn was his favourite season for poetical composition, and the deep silence of the night he commonly chose for his studies. The amusement of his leisure-hours were civil and natural history, voyages, and the best relations of travellers. Though he performed on no instrument, he was passionately fond of music, and would sometimes listen a full hour at his window to the nightingales in Richmond gardens; nor was his taste less exquisite in the arts of painting, sculpture, and architecture. As for the more distinguishing qualities of his mind and heart, they best appear in his writings. There his devotion to the Supreme Being, his love of mankind, of his country, and friends, shine out in every page; his tenderness of heart was to unbounded, that it took in even the brute creation. It is not known, that through his whole life he ever gave any person a moment's pain, either by his writings

Thomson's writings or otherwise. He took no part in the political squabbles of his time, and was therefore respected and left undisturbed by both sides. These amiable virtues did not fail of their due reward; the applause of the public attended all his productions, and his friends loved him with an enthusiastic ardour.

Thomson's
Lines of the
Poets.

“As a writer (says Dr Johnson), he is intitled to one praise of the highest kind; his mode of thinking, and of expressing his thoughts, is original. His blank verse is no more the blank verse of Milton, or of any other poet, than the rhymes of Prior are the rhymes of Cowley. His numbers, his pauses, his diction, are of his own growth, without transcripion, without imitation. He thinks in a peculiar train, and he thinks always as a man of genius; he looks round on Nature and on life with the eye which Nature bestows only on a poet; the eye that distinguishes, in every thing represented to its view, whatever there is on which imagination can delight to be detained, and with a mind that at once comprehends the vast, and attends to the minute. The reader of the Seasons wonders that he never saw before what Thomson shews him, and that he never yet has felt what Thomson impresses.”

His testamentary executors were the lord Lyttelton, whose care of our poet's fortune and fame ceased not with his life; and Mr Mitchell, a gentleman equally noted for the truth and constancy of his private friendship, and for his address and spirit as a public minister. By their united interests, the orphan play of Coriolanus was brought on the stage to the best advantage; from the profits of which, and the sale of manuscripts and other effects, a handsome sum was remitted to his sisters. His remains were deposited in the church of Richmond, under a plain stone, without any inscription. A handsome monument was erected to him in Westminster abbey in the year 1762, the charge of which was defrayed by the profits arising from a splendid edition of all his works in 4to; Mr Millar the bookseller, who had purchased all Mr Thomson's copies, giving up his property on this grateful occasion. A monument has also been erected to him at the place of his birth.

Henry's History of Great Britain, vol. ii. part 4.

THOR, the eldest and bravest of the sons of Odin and Frea, was, after his parents, the greatest god of the Saxons and Danes while they continued heathens. They believed, that Thor reigned over all the aerial regions, which composed his immense palace, consisting of 540 halls; that he launched the thunder, pointed the lightning, and directed the meteors, winds, and storms. To him they addressed their prayers for favourable winds, refreshing rains, and fruitful seasons; and to him the fifth day of the week, which still bears his name, was consecrated.

THORAX. See ANATOMY.

WHITE OF *HAW* THORN. See CRATÆGUS.

THORN, a town of Poland, in Regal Prussia, and in the palatinat of Culm. It was formerly a Hanseatic town, and still enjoys great privileges; is large and well fortified; but part of the fortifications, and a great number of houses, were ruined by the Swedes in 1703. It is seated on the Vistula, and contains 10,000 inhabitants. E. Long. 18. 42. N. Lat. 53. 6.

THORNBACK, in ichthyology. See RAIA.

THORNHILL (Sir James), an eminent English painter, was born in Dorsetshire in 1676, of an ancient family; but was constrained to apply to some profession by the distresses of his father, who had been reduced to the necessity of selling his family estate. His inclination directed him to the art of painting; and on his arrival at London he applied to his uncle, the famous Dr Sydenham, who enabled him to proceed in the study of the art under the direction of a painter who was not very eminent. However, the genius

Dictionary of Painters.

of Thornhill made ample amends for the insufficiency of his instructor, and by an happy application of his talents he made so great a progress, that he gradually rose to the highest reputation.

His genius was well adapted to historical and allegorical compositions; he possessed a fertile and fine invention; and he sketched his thoughts with great ease, freedom, and spirit. He excelled also equally in portrait, perspective, and architecture; shewed an excellent taste for design, and had a free and firm pencil. Had he been so fortunate as to have studied at Rome and Venice, to acquire greater correctness at the one, and a more exact knowledge of the perfection of colouring at the other, no artist among the moderns might perhaps have been his superior. Nevertheless, he was so eminent in many parts of his profession, that he must for ever be ranked among the best painters of his time; and his performances in the dome of St Paul's church at London, in the hospital at Greenwich, and at Hampton-court, are such public proofs of his merit as will convey his name to posterity with great honour.

This painter lived in general esteem; he enriched himself by the excellence of his works; was appointed state-painter to Queen Anne, from whom he received the honour of knighthood; had the singular satisfaction to repurchase his family estate; and was so much distinguished as to be elected one of the members of parliament. He died in 1732.

THOROUGH-WAX, in botany. See BUPLEURUM.

THOTH, or THEUT, (called by the Phœnicians *Taaut*, by the Greeks *Hermes*, and by the Romans *Mercury*), was a Phœnician of very superior talents, and one of the civilizars of mankind. He was prime minister to Osiris, whom, after his death, he deified; and he was himself deified by his countrymen the Egyptians, for the benefits that he had rendered to the human race. See MERCURY, MYTHOLOGY, n° 34, and POLYTHEISM, n° 18.

THOUGHT, a general name for all the ideas consequent on the operations of the mind, and even on the operations themselves. See METAPHYSICS.

THOUGHT, in composition. See ORATORY, Part I. and II.

THOUINIA, in botany; a genus of plants belonging to the class of *diandria*, and order of *monogynia*. The corolla is quadripetalous; the calyx quadripartite, and the antheræ sessile. There is only one species discovered, the *nuttans*.

THRACE, a country very frequently mentioned by the Greek and Latin writers, deriving its name, according to Josephus, from Tiras one of the sons of Japhet. It was bounded on the north by mount Hæmus; on the south, by the Ægean Sea; on the west, by Macedonia and the river Strymon; and on the east, by the Euxine Sea, the Hellespont, and the Propontis.—The Thracian Chersonesus is a peninsula inclosed on the south by the Ægean Sea, on the west by the gulf of Melas, and on the east by the Hellespont; being joined on the north to the continent by a neck or land about 37 furlongs broad. The inland parts of Thrace are very cold and barren, the snow lying on the mountains the greatest part of the year; but the maritime provinces are productive of all sorts of grain and necessaries for life; and withal so pleasant, that Mela compares them to the most fruitful and agreeable countries of Asia.

The ancient Thracians were deemed a brave and warlike nation, but of a cruel and savage temper; being, according to the Greek writers, strangers to all humanity and good nature. It was to the Thracians, however, that the Greeks were chiefly indebted for the polite arts that flourished among them; for Orphæus, Linus, Musæus, Thamyras, and Eumolpus, all Thracians, were the first, as Eustathius informs us, who charmed the inhabitants of Greece with their eloquence

eloquence and melody, and persuaded them to exchange their fierceness for a sociable life and peaceful manners; nay, great part of Greece was anciently peopled by Thracians. Tereus, a Thracian, governed at Daulis in Phocis, where the tragical story of Philomela and Progne was acted. From thence a body of Thracians passed over to Lucea, and possessed themselves of that island. Of the same nation were the Aones, Lembes, and Hyanthians, who made themselves masters of Eceotia; and great part of Attica itself was inhabited by Thracians, under the command of the celebrated Eumolpus. It is not therefore without the utmost ingratitude and injustice that the Greeks style them *Barbarians*, since to them chiefly they were indebted both for the peopling and polishing of their country.

Thrace was anciently divided into a number of petty states, which were first subdued by Philip of Macedon. On the decline of the Macedonian empire, the country fell under the power of the Romans. It continued under subjection to them till the irruption of the Turks, in whose hands it still remains.

THRASHING, in agriculture, the operation by which corn is separated from the straw. This operation is performed in a variety of ways, sometimes by the feet of animals, sometimes by a flail, and sometimes by a machine.

The most ancient method of separating the corn from the straw was by the hoofs of cattle or horses. This was practised by the Israelites, as we find from the books of Moses; it was also common among the Greeks and Romans*. Flails and thrashing machines were also not uncommon among these nations †. The flail which was used by the Romans, called *laculus*, *fustis*, or *pertica*, was probably nothing more than a cudgel or pole. The thrashing machine, which was called *tribula* or *tribulum*, and sometimes *traba*, was a kind of sled, made of boards joined together, and loaded with stone or iron. Horses were yoked to this machine, and a man was seated upon it to drive them over the sheaves of corn.

Different methods are employed in different countries for separating the corn from the stalk. In the greatest part of France the flail is used; but in the southern districts it is generally performed by the feet of animals: animals are also used for the same purpose in Spain, in Italy, in the Morea, in the Canaries, in China, and in the vicinity of Canton, where the flail is also sometimes used. It appears that in hot climates the grains do not adhere so firmly to the stalk as in cold countries, and therefore may be more easily separated. This will explain the reason why animals are so frequently employed in hot countries for treading out the corn; whereas in cold climates we know they are seldom tried, and have no reason to suppose that they would answer the purpose. In the Isle of France in Africa, rice and wheat are thrashed with poles, and maize with sticks; for it has not been possible to teach the negroes the use of the flail.

The animals used for treading out corn are, oxen, cows, horses, mules, and even asses when the quantity is not great. The operation is performed in this manner: The sheaves, after being opened, are tread in such a manner that the ears of the corn are laid as much uppermost as possible, and a man, standing in the centre, holds the halters of the cattle, which are made to trot round as in a manege; whilst other men with forks shake the straw up from time to time, and the cattle are trotted over it a gain and again till they have beaten out all the grain. This method is expeditious enough; but besides bruising a considerable quantity of corn, it requires a great many cattle, and injures the legs of the horses and mules, which are preferred before cows and oxen for this work.

The flail is undoubtedly a much better instrument for

thrashing corn than the feet of animals, for it separates the grain from the straw and husks both more effectually and more expeditiously; yet it is liable to many objections. It is a very laborious employment, too severe indeed even for a strong man; and as it is usually the interest of the thrasher rather to thrash much than to thrash clean, a good deal of corn will generally be left upon the straw. It is therefore an object of great importance in husbandry to procure a proper machine for separating the corn from the straw.

The first thrashing machine attempted in modern times, of which we have received any account, was invented in Edinburgh by Mr Michael Menzies about the year 1732. It consisted of a number of instruments like flails, fixed in a moveable beam, and inclined to it at an angle of ten degrees. On each side of the beam in which the flails were fixed, floors or benches were placed for spreading the sheaves on. The flails were moved backwards and forwards upon the benches by means of a crank fixed on the end of an axle, which made about 30 revolutions in a minute.

The second thrashing machine was invented by Mr Michael Stirling, a farmer in the parish of Dunblane, Perthshire. Of this discovery we have received a very accurate and authentic account from his son, the Reverend Mr Robert Stirling minister of Crieff.

It is an old proverb, that necessity is the mother of invention. This was verified on the present occasion. Besides his ordinary domestic servants, Mr M. Stirling had occasion sometimes to hire an additional number to thrash out his grain, and frequently found it difficult to procure so many as he needed. This naturally led him to reflect whether the operation of thrashing could not easily be performed by machinery. Accordingly, so early as the year 1753, under the pretence of joining in the amusements of his children, he formed in miniature a water mill, in which two iron springs, made to rise and fall alternately, represented the motion of two flails, by which a few stalks of corn put under them might be speedily thrashed. This plan he executed on a scale sufficiently large within two years after, making the springs about ten feet long, each of which had one end firmly screwed into a solid plank, and the other terminated in a round baton of solid iron, two feet long and above an inch in diameter. Under these the sheaves were conveyed gradually forward in a narrow channel or trough, by passing between two indented horizontal cylinders, similar to those now used in most of the thrashing mills in that part of the country, and called *feeders*. In this manner the thrashing was executed completely, and with considerable rapidity; but as the operation was performed on a low floor, and no method contrived for carrying off the straw, the accumulation of it produced such confusion, and the removal of it was attended with such danger, that this scheme was very soon entirely abandoned. The mortification arising from disappointment, and especially the scoffs of his neighbours, for what was universally accounted an absurd and ridiculous attempt, served only to stimulate the exertions of the inventor to accomplish his designs on another plan.

Laying aside therefore the iron springs with the feeders, and all the apparatus adapted to them, he retained only an outer or water wheel, with an inner or cog wheel moving on the same axle; to this inner wheel, which had 48 teeth or cogs, he applied a vertical trundle or pinion, with seven notches, the axle of which passed through a floor above the wheel, and having its upper pivot secured in a beam six feet above that floor. At the distance of three feet three inches above the floor two straight pieces of squared wood, each four feet long, passed through the axle of the trundle at right angles, forming four arms, to be moved round horizontally. To the extremities of these arms were fixed

Threshing. four iron plates, each 20 inches long, and eight broad at the end next the arms, but tapering towards a point at the other end. This large horizontal fly, constituting four thrashers, was inclosed within a wooden cylindrical box three and an half feet high and eight in diameter. On the top of the box was an opening or port (two or three ports were made at first, but one was found sufficient) eight inches wide, and extending from the circumference a foot and an half towards its centre, through which the corn sheaves descended, being first opened and laid one by one on a board with two ledges gently declining towards the port; on which board they were moderately pressed down with a boy's hand, to prevent them from being too hastily drawn in by the repeated strokes of the thrashers. Within the box was an inclined plane, along which the straw and grain fell down into a wide wire riddle two feet square, placed immediately under a hole of nearly the same size. The riddle received a jerk at every revolution of the spindle from a knob placed on the side of it, and was instantly thrust backward by a small spring pressing it in the opposite direction. The short straw, with the grain and chaff which passed through the wide riddle, fell immediately into an oblong strait riddle, which hung with one end raised and the other depressed, and was moved by a contrivance equally simple as the other; and having no ledge at the lower end, the long chaff which could not pass through the riddle dropped from thence to the ground; while the grain and most of the chaff falling through the riddle into a pair of common barn-fanners that stood under it on the ground floor, the strong grain, the weak, and the chaff, were all separated with great exactness. The fanners were moved by a rope or band running circuitously in a shallow niche cut on the circumference of the cog-wheel. The straw collected gradually in the bottom of the box over the wide riddle, and through an opening two and an half feet wide, and as much in height, left in that side of the box nearest the brink of the upper floor, was drawn down to the ground with a rake by the person or persons employed to form it into sheaves or rolls.

Such was the thrashing mill invented by Mr Michael Stirling, which, after various alterations and improvements, he completed in the form now described, A. D. 1758. By experiment it was found that four bolls of oats, Louthgow measure, could be thrashed by it in 25 minutes. From that period he never used a common flail in thrashing, except for lambing or bearding barley. In every other kind of grain he performed the whole operation of thrashing with the mill; and continued always to use it till 1772, when he retired from business, and his thrashing mill became the property of his second son, who continues to use it with equal advantage and satisfaction. Several machines were constructed on the same plan, particularly one near Stirling, under Mr Stirling's direction, for Mr Moir of Leckie, in 1765, which, we understand, has been used ever since, and gives complete satisfaction to the proprietor. There was another erected in 1778 by Mr Thomas Keir (in the parish of Muthil and county of Perth), who has contrived a method of bearding barley with it; and by the addition of a small spindle with short arms contiguous to the front of the box, and moved by a band common to it and the great spindle to which it is parallel, the straw is shaken and whirled out of the box to the ground. That this machine did not come immediately into general use, was owing partly to the smallness of the farms in that part of the country, whose crops could easily be thrashed by the few hands necessarily retained on them for other purposes; and chiefly to an apprehension that the machine could only be moved by water; an apprehension which experience proves to be entirely groundless. The

machine however, was, ingenious, and did great credit to the worthy inventor, and certainly deserved a better fate than it was destined to undergo.

A third threshing mill was invented in 1772, by two persons nearly about the same time, and upon the same principles. The inventors were, Mr Alderton who lived near Altwick, and Mr Smart at Wark in Northumberland. The operation was performed by rubbing. The sheaves were carried round between an indented drum of about six feet diameter, and a number of indented rollers arranged round the circumference of the drum, and attached to it by means of springs; so that while the drum revolved, the fluted rollers rubbed the corn off from the straw by rubbing against the flutings of the drum. But as a considerable quantity of the grain was bruised in passing between the rollers, the machine was soon laid aside.

In 1776 an attempt was made by Mr Andrew Meikle, an ingenious millwright in the parish of Tynningham, East Lothian, to construct a new machine upon the principles which had been adopted by Mr Menzies already mentioned. This consisted in making joints in the flails, which Mr Menzies had formed without any. But this machine, after much labour and expence, was soon laid aside, on account of the difficulty of keeping it in repair, and the small quantity of work performed, which did not exceed one boll or six Winchester bushels of barley per hour.

Some time after this, Mr Francis Kinloch, then junior of Gilmerton, having visited the machine invented in Northumberland, attempted an improvement upon it. He inclosed the drum in a fluted cover; and instead of making the drum itself fluted, he fixed upon the outside of it four fluted pieces of wood, which by means of springs could be raised a little above the circumference of the drum, so as to press against the fluted covering, and thus rub off the ears of corn as the sheaves passed round between the drum and the fluted covering. But not finding this machine to answer his expectation (for it bruised the grain in the same manner as the Northumberland machine did), he sent it to Mr Meikle, that he might, if possible, rectify its errors.

Mr Meikle, who had long directed his thoughts to this subject, applied himself with much ardour and perseverance to the improvement and correction of this machine; and after spending a good deal of time upon it, found it was constructed upon principles so erroneous, that to improve it was impracticable.

At length, however, Mr Meikle's own genius invented a model, different in principle from the machines which had already been constructed. This model was made in the year 1785; and in the following year the first thrashing machine, on the same principles was erected in the neighbourhood of Alloa, in the county of Stirling, by Mr George Meikle the son of the inventor. This machine answered completely the wishes of Mr Stein, the gentleman for whom it was erected, who gave the most ample testimony of his satisfaction both to the inventor and to the public. The fame of this discovery soon spread over the whole country, and a great many farmers immediately applied to Mr Meikle, desiring to have thrashing mills erected on their farms. The discovery, it appeared, would be profitable, and it was reasonable that the inventor should enjoy the profits of his invention. He accordingly applied for a patent; which, after considerable expence, arising from the opposition of some persons, who claimed a share in the discovery, was granted.—These machines are now becoming very common in many parts of Scotland, and are increasing very considerably in number every year over all the united kingdom.

We will now endeavour to describe this machine in its most improved state; which is so simple, that with the assistance

Threshing. ance of a plate, exhibiting the plan of elevation, n^o 1. the ground plan, n^o 2. and the 3d showing its essential parts in a distinct manner, we hope it will be easily understood by all our readers who have not had an opportunity of seeing it. The power employed for turning that part of the machine which separates the corn from the straw is produced by four wheels (when moved by horses), the teeth of which move in one another and turn the drum, on which four scutchers are fixed. The sheaves are introduced between two fluted rollers, which hold them firm, and draw them in gradually, while the scutchers strike off the grain from the straw as it passes through. This will suffice for a general idea of this machine. We will now be more particular.

The large spur-wheel A, n^o 1. and 2. which has 276 cogs, is horizontal, and moves the pinion B, which has 14 teeth. The pinion B moves the crown wheel C, which has 84 teeth; the wheel C moves a second pinion D, which has 16 teeth; and the pinion D moves the drum HIKL. The drum is a hollow cylinder three feet and an half diameter, and placed horizontally; on the outside of which the scutchers are fixed by strong screw bolts. The scutchers consist of four pieces of wood, faced on one side with a thin plate of iron, placed at an equal distance from each other, and at right angles to the axis of the drum.

The sheaves are spread on an inclined board F, n^o 3. from which they are introduced between two fluted rollers GG made of cast iron, about three inches and an half in diameter, and making about 35 revolutions in a minute. As these rollers are only about three quarters of an inch distant from the scutchers or leaves of the drum HIKL, they serve to hold the sheaves fast, while the scutchers *a, b, c, d*, moving with prodigious velocity, separate the grain completely from the straw, and at the same time throw out both grain and straw upon the concave rack M, lying horizontally with slender parallel ribs, so that the corn passes through them into a hopper N placed below. From the hopper it passes through a harp or riddle O into a pair of fanners P, from which, in the most improved machines, it comes out clean and fit for the market. The straw, after being thrown by the scutchers *a, b, c, d*, into the rack, is removed from it by a rake QRST into a place contiguous V. The rake consists of four thin pieces of wood or leaves; on the end of each of these leaves is ranged a row of teeth *e, f, g, h* five inches long. The rake moves in a circular manner in the concave rack, while the teeth catch hold of the straw, and throw it out of the rack. These are all the essential parts of the machine; the rest may be easily understood by the references to the Plate. W is the horse-course, n^o 1, which is 27 feet diameter. X is the pillar for supporting the beams on which the axle of the spur-wheel is fixed. YYY are three spindles for moving the two fluted rollers, the rake, and fanners. To the description now given we have only to add, that the drum has a covering of wood Z at a small distance above it, for the purpose of keeping the sheaves close to the scutchers.

The advantages of this machine are many. As the drum makes 300 revolutions in a minute, the four scutchers together make 1200 strokes in the same space of time. From such power and velocity, it is evident that much work must be performed. When the horses go at the rate of two and

one-third miles per hour, from three to six bolts will be thrashed; but as the quantity thrashed will be less when the straw is long than when it is short, we shall take the average at four bolts. One gentleman, whose veracity and accuracy we can depend on, assures us, that his mill thrashed 63 bolts in a day; by which, we suppose, he meant 60 hours. To prove the superior advantage of this machine to the common method of thrashing with flails, a gentleman ordered two equal quantities of oats to be thrashed by the mill and by flails. When the corn was cleaned and measured, he obtained $\frac{1}{8}$ th more from the sheaves thrashed by the mill than from those thrashed by the flail. We are also informed by another gentleman who has studied this machine with much attention, and calculated its advantages with care, that, independently of having the corn much cleaner separated from the straw than is usually done by flails, there is a saving of 30 or 40 per cent. in the expence of thrashing.

The number of persons requisite for attending the mill when working is six: One person drives the horses; a second hands the sheaves to a third, who unties them, while a fourth spreads them on the inclined boards and presses them gently between the rollers; a fifth person is necessary to riddle the corn as it falls from the fanners, and a sixth to remove the straw (A).

This machine can be moved equally well by water, wind, or horses. Mr Meikle has made such improvements on the wind mill as to render it much more manageable and convenient than formerly; and we are informed many wind-mills are now erecting in different parts of the country. As to the comparative expence of these different machines, the erection of the horse machine is least; but then the expence of employing horses must be taken into consideration. One of this kind may be erected for L. 70. A water mill will cost L. 10 more on account of the expence of the water-wheel. A wind-mill will cost from L. 200 to L. 300 Sterling.

THRAVE of CORN, an expression denoting 24 sheaves, or four shocks of six sheaves to the shock; though in some countries they only reckon 12 sheaves to the thrave.

THRASYBULUS, a renowned Athenian general and patriot, the deliverer of his country from the yoke of the 30 tyrants, lived about 294 B. C.*

THRASYMENEUS LACUS (anc. geog.), a lake of Etruria, near Perugia, and not far from the Tiber, fatal to the Romans in the Punic war. Now *Il Lago de Perugia* on the Ecclesiastical State. * See *Ann.* n^o 199 —174.

THREAD, a small line made up of a number of fine fibres of any vegetable or animal substance, such as flax, cotton, or silk; from which it takes its name of linen, cotton, or silk thread.

Dyeing THREAD Black. Linen and cotton thread may be dyed of a durable and deep black by solution of iron in four beer, in which the linen is to be steeped for some time, and afterwards boiled in madder. See the article *DYEING*, n^o 87.

Thread may be easily bleached by the oxygenated muriatic acid discovered by Mr Scheele. This acid whitens cloth remarkably well, but it is still more advantageous for bleaching thread. M. Welter has formed at Lille, with two partners, an establishment for bleaching thread with great success, and he has already begun some others. He

(A) We add, on the authority of an experienced farmer, that of the six persons necessary to attend the thrashing machine, only two can in justice be charged to the account of the machine; namely, the person who manages the horses, and the one who feeds the machine: For in the usual mode of thrashing by the flail, it requires the same number of persons as the thrashing machine does to clear an equal quantity of corn from the chaff in the same time.

Threaten- has found that 10 or 12 leys and as many immersions are required for some sorts of thread; and that the thread may be surrounded with the liquor, it is necessary to place it, quite loosely, in a basket, which permits the liquor to penetrate to all its surfaces: when the liquor is much weakened, it is still fit to be used for the bleaching of cotton.

Those who wish more information upon the powerful effects of the oxygenated muriatic acid in bleaching, as well as on the cheapest method of preparing it, may consult a Paper written by M. Berthollet, and published in the *Annales de Chimie*, a translation of which is given in the *Reper. of Arts*, vol. i.

THREATENING LETTERS. Knowingly to send any letter without a name, or with a fictitious name, demanding money, or any other valuable thing, or threatening (without any demand) to kill or fire the house of any person, is made felony without benefit of clergy. And sending letters, threatening to accuse any person of a crime punishable with death, transportation, pillory, or other infamous punishment, with a view to extort from him any money or other valuable chattels, is punishable by statute 30 Geo. II. c. 24. at the discretion of the court, with fine, imprisonment, pillory, whipping, or transportation for seven years.

THRASHING. See **THRASHING.**

THRIFT, in botany. See **STATICE.**

THRINAX, SMALL JAMAICA FAN-PALM, in botany; a genus of plants belonging to the natural class of *palmeæ*, and order of *strobiliferae*. The calyx is sexdentate; there is no corolla; there are six stamina; the stigma is emarginate, and the berry monospermous. This plant was brought from Jamaica to Kew garden by Dr William Wright.

THRIPS, a genus of insects belonging to the order of *hemiptera*. The rostrum is obscure, or so small as to be scarce perceptible. The antennæ are filiform, and as long as the thorax. The body is slender, and of equal thickness in its whole length. The abdomen is reflexible, or bent upwards. The four wings are extended, incumbent upon the back of the insect, narrow in proportion to their length, and cross one another at some distance from their base. The tarsi of the feet are composed of only two articulations.

There are eleven species mentioned by Gmelin; of which three are natives of Britain; the *phytaphus*, *juniperina*, and *fasciata*.

THROAT, the anterior part of an animal, between the head and the shoulders.

THROAT-WORT. See **CAMPANULA.**

THRONE, a royal seat or chair of state, enriched with ornaments of architecture and sculpture, raised on one or more steps, and covered with a kind of canopy. Such are the thrones in the rooms of audience of kings and other sovereigns.

THROSTLE, in ornithology. See **TURDUS.**

THRUSH, in ornithology. See **TURDUS.**

THRUSH, or *Aphtha*. See **MEDICINE**, n^o 233.

TRYALLIS, in botany; a genus of plants belonging to the class of *decandria*, and order of *monogynia*; and in the natural system ranging under the 38th order, *Tricocca*. The calyx is quinquepartite; there are five petals, and the capsule is tricoccus. There is only one species known, the *brasilensis*.

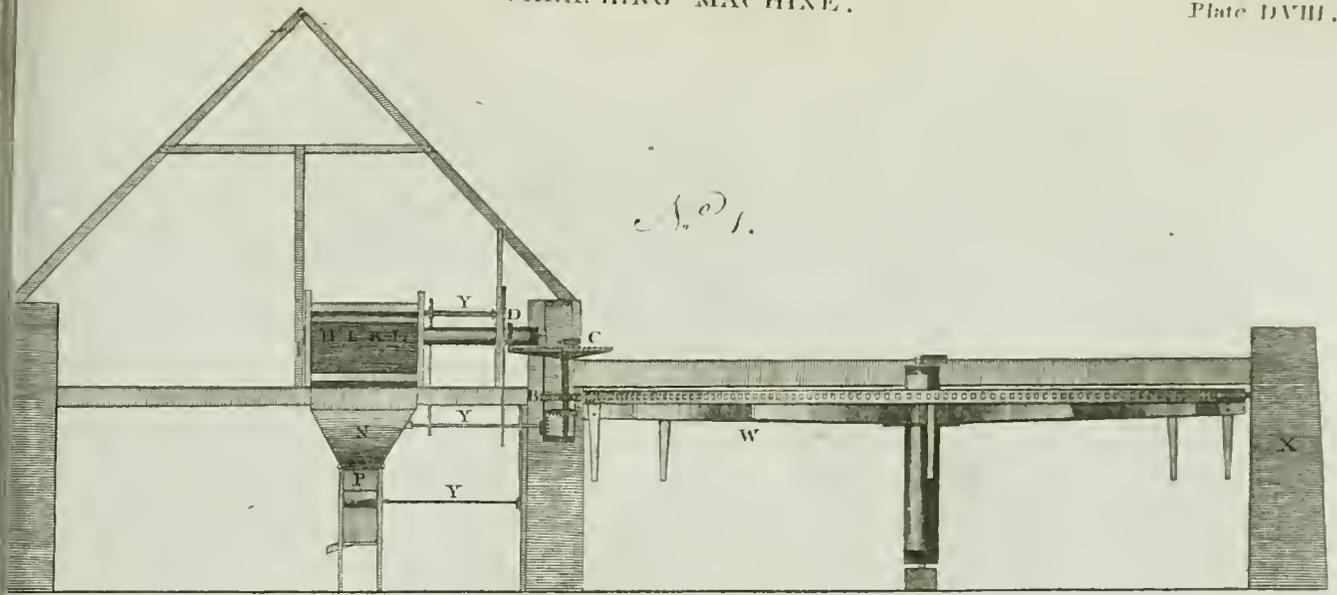

THUANUS (Jacobus Augustus), youngest son of the president de Thou, was famous for the depth and erudition of his works. He was born in 1553; and having finished his studies and travels, was made president a-Mortier, and took possession thereof in 1595. He was employed in several important offices of state, and in reforming the uni-

versity of Paris; which he discharged with so much prudence, that he was esteemed the Cato of his age, and the ornament of France. He wrote the history of his own time in Latin, from the year 1543 to 1608, in 138 books; a work, both for subject and style, worthy of the ancients. He also left memoirs of his own life, besides poems; and died at Paris, 1617.

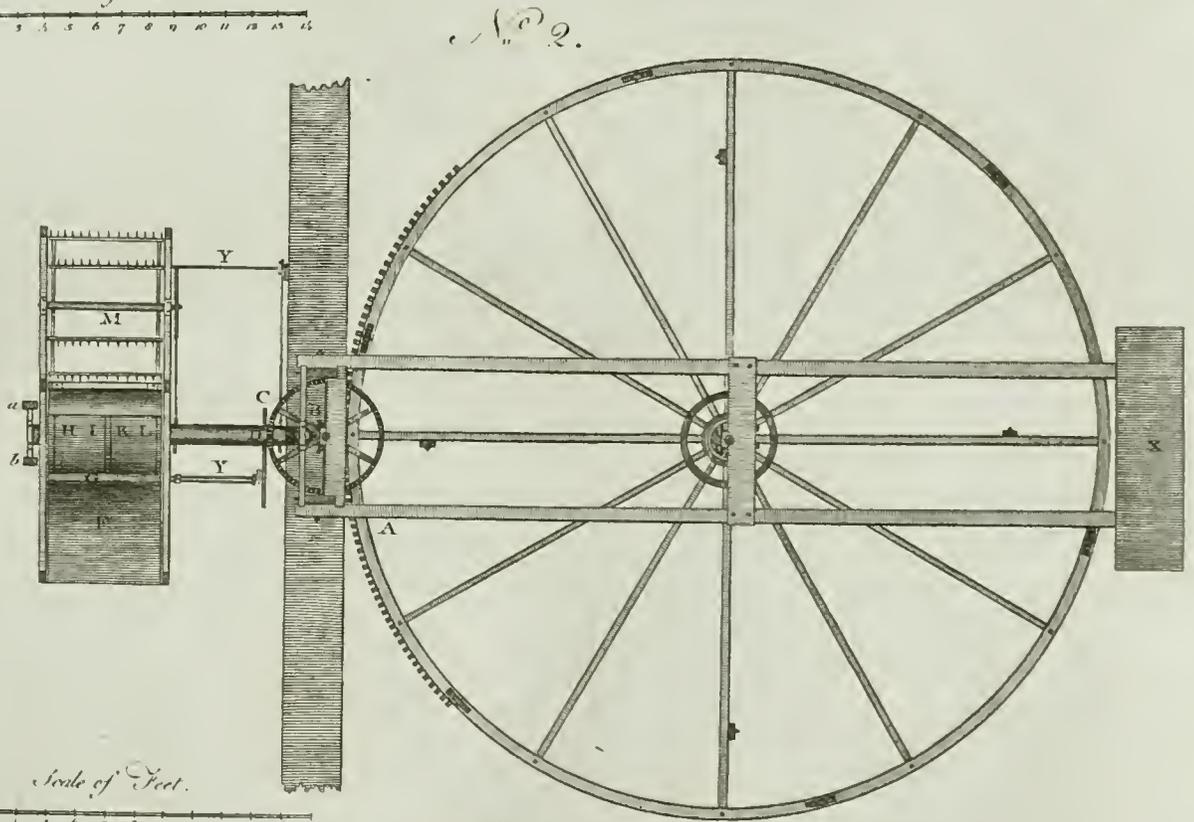

THUCYDIDES, a celebrated Greek historian, was born at Athens 471 B. C. He was the son of Olorus, and grandson of Miltiades, who is thought to have been descended from Miltiades the famous Athenian general, and to have married the king of Thrace's daughter. He was educated in a manner suitable to his quality, that is, in the study of philosophy and eloquence. His master in the former was Anaxagoras, in the latter Antiphon; one, by his description in the eighth book of his History, for power of speech almost a miracle, and feared by the people on that account. Suidas and Photius relate, that when Herodotus recited his history in public, a fashion in use then and many ages after, Thucydides felt so great a sting of emulation, that it drew tears from him; insomuch that Herodotus himself took notice of it, and congratulated his father on having a son who showed so wonderful an affection to the Muses. Herodotus was then 29 years of age, Thucydides about 16.

When the Peloponnesian war began to break out, Thucydides conjectured truly, that it would prove a subject worthy of his labour; and it no sooner commenced than he began to keep a journal. This explains the reason why he has attended more to chronological order than to unity of design. During the same war he was commissioned by his countrymen to relieve Amphipolis; but the quick march of Brasidas the Lacedæmonian general defeated his operations; and Thucydides, unsuccessful in his expedition, was banished from Athens. His banishment happened in the eighth year of this celebrated war; and in the place of his banishment the general began to write an impartial history of the important events which had happened during his administration, and which still continued to agitate the several states of Greece. This famous history is continued only to the 21st year of the war, and the remaining part of the time till the demolition of the walls of Athens was described by the pen of Theopompus and Xenophon. Thucydides wrote in the Attic dialect, as being possessed of most vigour, purity, elegance, and energy. He spared neither time nor money to procure authentic materials; and the Athenians, as well as their enemies, furnished him with many valuable communications, which contributed to throw great light on the different transactions of the war. His history has been divided into eight books; the last of which is imperfect, and supposed to have been written by his daughter.

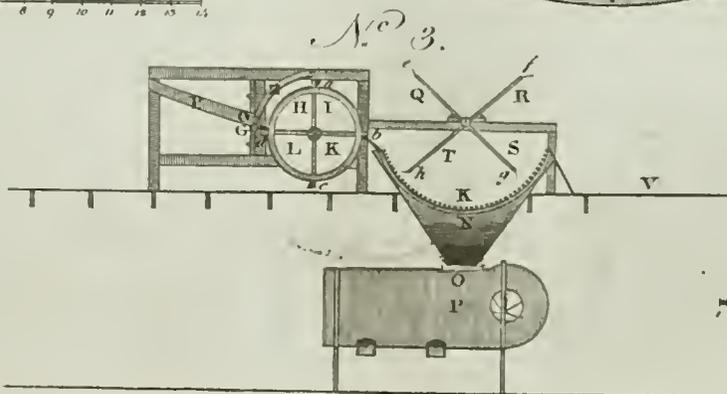

The historian of Halicarnassus has often been compared with the son of Olorus, but each has his peculiar excellence. Sweetness of style, grace and elegance of expression, may be called the characteristics of the former; while Thucydides stands unequalled for the fire of his descriptions, the conciseness, and at the same time the strong and energetic manner of his narratives. His relations are authentic, as he himself was interested in the events he mentions; his impartiality is undoubted, as he nowhere betrays the least resentment against his countrymen, and the factious partizans of Cleon, who had banished him from Athens. The history of Thucydides was so admired by Demosthenes, that he transcribed it eight different times, and read it with such attention, that he could almost repeat it by heart. Thucydides died at Athens, where he had been recalled from his exile about 411 years before Christ.

The best edition of Thucydides is that of Oxford, published in 1696, folio, and that of Duker, published at Amsterdam in 1731, folio.

THUJA, the *ARBOR VITÆ*, in botany: A genus of plants belonging to the class of *monodelphia*, and order of *monœcia*; and in the natural system ranging under the 51st order, *Cônifera*. There are four species known; the *orientalis*, *occidentalis*, *apylla*, and *dolabrata*; of which the two first are most remarkable.

The *occidentalis*, or common *arbor vitæ*, grows naturally in Canada, Siberia, and other northern countries. In some of the English gardens a few of these trees are to be met with of a large size: it has a strong woody trunk, which rises to the height of 40 feet or more. The bark, while young, is smooth, and of a dark brown colour; but as the trees advance, the bark becomes cracked, and less smooth. The branches are produced irregularly on every side, standing almost horizontal, and the young slender shoots frequently hang downward, thinly garnished with leaves; so that when the trees are grown large they make but an indifferent appearance. The young branches are flat, and their small leaves lie imbricated over each other like the scales of a fish; the flowers are produced from the side of the young branches pretty near to the foot-stalk; the male flowers grow in oblong catkins, and between these the female flowers are collected in form of cones. When the former have shed their farina, they soon after drop off; but the female flowers are succeeded by oblong cones, having obtuse smooth scales, containing one or two oblong seeds. The leaves of this tree have a rank oily scent when bruised.

2. The *orientalis*, or China *arbor vitæ*, grows naturally in the northern parts of China, where it rises to a considerable height; but this has not been long enough in Europe to have any trees of large size. The seeds of this sort were first sent to Paris by some of the missionaries; and there are some of the trees growing in the gardens of the curious there, which are more than 20 feet high. The branches of this sort grow closer together, and are much better adorned with leaves, which are of a brighter green colour, so make a much better appearance than the other, and being very hardy, it is esteemed preferable to most of the evergreen trees with small leaves, for ornament in gardens. The branches of this tree cross each other at right angles: the leaves are flat; but the single divisions of the leaves are slender, and the scales are smaller and lie closer over each other than those of the first sort. The cones are also much larger, and of a beautiful grey colour; their scales end in acute reflexed points.

These trees are propagated by seeds, layers, or cuttings.

THULE, or *THYLÆ*, (anc. *gæog*), an island in the most northern parts of the German Ocean. Its situation was never accurately ascertained by the ancients, hence its present name is unknown by modern historians. Some suppose that it is the island now called Iceland, or part of Greenland, and others that it was *Foua*. See *FOULA*.

THUMB, in anatomy, one of the extremities of the hand.

Thumb-Cap, an island in the South Sea, lies about seven leagues north-west of Lagoon-island; it is a low, woody island, of a circular form, and not much above a mile in compass. There was no appearance of inhabitants; the land was covered with verdure of many hues.

THUMMIM. See *URIM*.

THUNBERGIA, in botany; a genus of plants belonging to the class of *didynamia*, and order of *angiosperma*. The calyx is double; the exterior one is diphyllous, and the interior one multipartite. The capsule is globose, beaked,

and bilocular. There is only one species known, the *capensis*. Thunbergia

THUNDER, the noise occasioned by the explosion of a flash of lightning echoed back from the inequalities on the surface of the earth, in like manner as the noise of a cannon is echoed, and in particular circumstances forms a rolling lengthened sound.

Although *thunder*, properly speaking, is only a mere sound, capable of producing very little effect, yet the word is generally supposed to include the phenomena of lightning also; and electrified clouds are by universal consent called *thunder clouds*, and the explosions of many flashes of lightning proceeding from them are generally called *thunder-forms*. Though the phenomena of lightning, therefore, have been at a great length explained and accounted for under the articles *ELECTRICITY* and *LIGHTNING*, and though the immediate cause of electrical explosions from clouds is explained under the article *RAIN*; yet the ultimate cause remains still to be shown, and properly belongs to the present article.

It is universally allowed, that the variation of the electricity in different parts of the atmosphere is the cause of thunder. Under the article *ELECTRICITY*, it has been shown why lightning explodes after the thunder clouds are charged. Under the article *LIGHTNING*, it is shown why that meteor puts on the various forms in which we see it, why it sometimes strikes houses or animals, and sometimes not, &c.; and under the article *RAIN*, why the atmosphere in some cases parts with the vapours which at other times it so obstinately retains. It remains therefore only to mention the theory by which some philosophers explain the reason why rains are sometimes attended with thunder, and sometimes not; which, to those who attentively peruse the articles above-mentioned, may be done in few words.

In this part of Great Britain, and for a considerable way along the eastern coast, although thunder may happen at any time of the year, yet the month of July is that in which it may almost certainly be expected. Its duration is of very uncertain continuance; sometimes only a few peals will be heard at any particular place during the whole season; at other times the storm will return at the interval of three or four days for a month, six weeks, or even longer; not that we have violent thunder in this country directly vertical in any one place so frequently in any year, but in many seasons it will be perceptible that thunder clouds are formed in the neighbourhood even at these short intervals. Hence it appears, that during this particular period there must be some natural cause operating for the production of this phenomenon, which does not take place at other times. This cannot be the mere heat of the weather, for we have often a long tract of hot weather without any thunder; and besides, though not common, thunder is sometimes heard in the winter also. As therefore the heat of the weather is common to the whole summer, whether there be thunder or not, we must look for the causes of it in those phenomena, whatever they are, which are peculiar to the months of July, August, and the beginning of September. Now it is generally observed, in the tract of country of which we now speak, that from the month of April an east or south-east wind generally takes place, and continues with little interruption till towards the end of June. At that time, sometimes sooner and sometimes later, a westerly wind takes place; but as the causes producing the east wind are not removed, the latter opposes the west wind with its whole force. At the place of meeting, there is naturally a most vehement pressure of the atmosphere, and friction of its parts against one another; a calm ensues, and the vapours brought by both winds begin to collect and form dark clouds, which

Thunder. can have little motion either way, because they are pressed almost equally on all sides. For the most part, however, the west wind prevails, and what little motion the clouds have is towards the east: whence the common remark in this country, that "thunder-clouds move against the wind." But this is by no means universally true: for if the west wind happens to be excited by any temporary cause before its natural period when it should take place, the east wind will very frequently get the better of it; and the clouds, even although thunder is produced, will move westward. Yet in either case the motion is so slow, that the most superficial observers cannot help taking notice of a considerable resistance in the atmosphere.

That when two streams of air are thus driven against each other, the space where they meet must become highly electrified, is as plain as that an electric globe must be excited when friction is applied. It is true, as the substances here to be excited are both electrics *per se*, it may be objected, that no electricity could be produced; for we cannot excite one electric by rubbing it with another. Yet it is observed, that glass may be electrified by blowing strongly upon it, or by the explosion of cannon; and even when glass is strongly pressed upon glass, both pieces become electrified as soon as they are separated. When glass is rubbed upon glass, no attraction nor repulsion can be perceived, nor is any sign of electricity observed on bodies brought near to it; yet a very bright electric light always appears on the glasses, and a phosphoreal smell is felt; which shows, that though the electricity does not fly out through the air in the usual way, yet the fluid within the glass is agitated; and there is little reason to doubt that any conducting body enclosed within the substance of the glass would be electrified also. The vapours therefore, which are the conducting substances in the atmosphere, become immediately electrified in consequence of the pressure above-mentioned, and all the phenomena described under the various articles already referred to take place.

In like manner, by the struggle of two other winds as well as those of the east and west, may a thunder-storm be produced; but it is always necessary that the resistance of the air to the motion of the clouds should be very great, and nearly equal all round. For if the vapour should get off to a side, no thunder would take place; the electricity would then be carried off as fast as it was collected, and rain would only be the consequence, by reason of the electrified vapours parting with their latent heat, as is explained under the article RAIN. In fact, we very often observe, that in the time of rain the clouds evidently move across the wind, and the nearer their motion is to a direct opposition, the heavier will the rain be; while, on the other hand, if they move briskly before the wind, let the direction be what it will, the atmosphere soon clears up.

That rattling in the noise of thunder which makes it seem as if it passed thro' arches, or were variously broken, is probably owing to the sound being excited among clouds hanging over one another, and the agitated air passing irregularly between them. The explosion, if high in the air, and remote from us, will do no mischief; but when near, it may destroy trees, animals, &c. In its proximity or small distance may be estimated nearly by the interval of time between seeing the flash of lightning and hearing the report of the thunder, estimating the distance after the rate of 1142 feet *per* second of time, or three two third seconds to the mile. Dr Wallis observes, that commonly the difference between the two is about seven seconds, which, at the rate above-mentioned, gives the distance almost two miles. But sometimes it comes in a second or two, which argues the explosion very near us, and even among us. And in such

cases, the Doctor assures us, he has sometimes foretold the mischiefs that happened.

The noise of thunder and the flame of lightning are easily made by air. If a mixture of oil or spirit of vitriol be made with water, and some filings of steel added to it, there will immediately arise a thick smoke or vapour out of the mouth of the vessel; and if a lighted candle be applied to this, it will take fire, and the flame will immediately descend into the vessel, which will be burst to pieces with a noise like that of a cannon.

This is to far analogous to thunder and lightning, that a great explosion and fire are occasioned by it; but in this they differ, that this matter when once fired is destroyed, and can give no more explosions; whereas, in the heavens, one clap of thunder usually follows another, and there is a continued succession of them for a long time. Mr Homberg explained this by the lightness of the air above us in comparison of that near, which therefore would not suffer all the matter so kindled to be dissipated at once, but keeps it for several returns.

Respecting the phenomena of thunder, we have many observations to communicate; some of which, we flatter ourselves, are new, and all of them valuable; but our bounds oblige us, though with great reluctance, to pass them over.

THUNDERBOLT. When lightning acts with extraordinary violence, and breaks or shatters any thing, it is called a *thunderbolt*, which the vulgar, to fit it for such effects, suppose to be a hard body, and even a stone. But that we need not have recourse to a hard solid body to account for the effects commonly attributed to the thunderbolt, will be evident to any one who considers those of the *pulvis fulminans* and of gunpowder; but more especially the astonishing powers of electricity, when only collected and employed by human art, and much more when directed and exercised in the course of nature.

When we consider the known effects of electrical explosions, and those produced by lightning, we shall be at no loss to account for the extraordinary operations vulgarly ascribed to thunderbolts. As stones and bricks struck by lightning are often found in a vitrified state, we may reasonably suppose, with Beccaria, that some stones in the earth having been struck in this manner, gave occasion to the vulgar opinion of the thunderbolt.

THUNDER-Howl. See ELECTRICITY, p. 474.

THURINGIA, a division of the circle of Upper Saxony in Germany. It is a fruitful tract, abounding in corn, especially wheat; in black cattle, sheep, and horses. It is about 73 miles in length, and as much in breadth. It contains 47 towns, 14 boroughs, betwixt 700 and 800 villages, 300 noble estates, 7 superintendencies, and 5 universities. Thuringia, the country of the ancient Thuringi, or Catti, a branch of the Vandals, mentioned by Tacitus, was formerly a kingdom, afterwards a county, then a landgraviate, and was governed by its own princes for many ages, till 1124, when it devolved to the marquis of Meissnia, and, with that country, afterwards to the Duke of Saxony. But the modern Thuringia is only a part of the ancient, nay, but a part of the ancient South Thuringia, which comprehends besides, a large share of the modern Franconia, Hesse, &c. On the extinction of the male line of the ancient landgraves in 1247, it came to the margraves of Meissen, ancestors to the present electoral family. The elector has no voice in the diet, on account of his share in the landgraviate or circle of Thuringia. Erfurt is the capital.

THURLOE (John), an English statesman under Oliver Cromwell, was born at Abots Roding in Essex in 1616, of which parish his father was rector, and was educated to

the study of the law. In 1648 he was made receiver or clerk of the curfitor fines; and though his attachments were entirely on the side of the parliament, he declares himself totally unconcerned in all counsels relative to the death of the king: however, on that event, and on the establishment of the commonwealth, he was diverted from prosecuting his employments in the law by engaging in public business. When Cromwell assumed the protectorship, he became secretary of state; in 1655, he had the care and charge both of foreign and inland postage committed to him by the protector; and was afterward sworn one of his privy-council, according to "The humble petition and advice." He was continued in the same capacities under Richard Cromwell, and until measures were taken for the Restoration; when he made an offer of his services to that end, which, however, were not accepted. May 15th 1660, he was committed to the custody of the serjeant at arms on a charge of high treason; but being soon released, he retired to Great Milton in Oxfordshire: and though he was afterward often solicited by Charles II. to engage in the administration of public business, he thought proper to decline the offers. He died in 1668: and was a man of an amiable private character, who in the highest of his power exercised all possible moderation towards persons of every party. The most authentic testimony of his abilities is that vast collection of state-papers, seven volumes folio, now in the hands of the public; which place the affairs of Great Britain, and of Europe in general, during that remarkable period in the clearest light.

THURSDAY, the fifth day of the Christian week, but the sixth of that of the Jews.

THUS, FRANKINCENSE, a solid brittle resin, brought to us in little globes or masses, of a brownish or yellowish colour on the outside, internally whitish or variegated with whitish specks. It is supposed to be the produce of the pine that yields the common turpentine, and to congeal upon the surface of the terebinthinate juice soon after it has issued from the tree. See **INCENSE**.

THUYA. See **THUJA**.

THYMUS, THYME, in botany: A genus of plants belonging to the class of *dynamia*, and order of *gymnospermia*; and in the natural system ranging under the 42d order, *Verucillata*. The calyx is bilabiate, and its throat closed with soft hairs. There are 11 species; of which two only are natives of Britain, the *serpyllum* and *acinus*.

1. The *serpyllum*, or mother of thyme, has pale red flowers growing on round heads, terminal; the stalks are procurrent, and the leaves plane, obtuse, and ciliated at the base.
2. The *acinus*, or wild basil, has flowers growing in whorls on single footstalks; the stalks are erect and branched; the leaves acute and serrated. The *thymus vulgaris*, or garden thyme, is a native of France, Spain, and Italy.—The attachment of bees to this and other aromatic plants is well known. In the experiments made at Upsal, sheep and goats were observed to eat it, and swine to refuse it.

THYMUS, in anatomy. See **ANATOMY**, n^o 114.

THYRSUS, in antiquity, the sceptre which the poets put into the hand of Bacchus, and wherewith they furnished the menades in their Bacchanalia.

THYRSUS, in botany, a mode of flowering resembling the cone of a pine. It is, says Linnæus, a panicle contracted into an oval or egg-shaped form. The lower footstalks, which are longer, extend horizontally, whilst the upper ones are shorter and mount vertically. Lilac and butter-bur furnish examples.

TIARA, an ornament or habit wherewith the ancient Persians covered their head; and with which the Armenians and kings of Pontus are represented on medals; these

last, because they were descended from the Persians. Latin authors call it indifferently *tiara* and *cidaris*. Strabo says, the tiara was in form of a tower; and the scholiast on Aristophanes's comedy, *ΑΧΕΡΩΝ*, act 1. scene 2. affirms, that it was adorned with peacock's feathers.

TIARA is also the name of the pope's triple crown. The tiara and keys are the badges of the papal dignity; the tiara of his civil rank, and the keys of his jurisdiction: for as soon as the pope is dead, his arms are represented with the tiara alone, without the keys. The ancient tiara was a round high cap. John XXIII. first encompassed it with a crown. Boniface VIII. added a second crown; and Benedict XII. a third.

TIARELLA, in botany: A genus of plants belonging to the class of *decandria*, and order of *dignia*; and in the natural system ranging under the 13th order, *Succulentæ*. The calyx is quinquepartite; the corolla pentapetalous, and inserted into the calyx; the petals are entire; the capsule is unilocular and bivalve, the one valve being less than the other. There are two species, the *cordifolia* and *trifoliata*.

TIBER, a great river of Italy, which runs through the pope's territories, passing by Perugia and Orvieto; and having visited Rome, falls into the Tuscan sea at Ostia, fifteen miles below that city.

TIBET, called by the Tartars *Barantola*, *Bootan*, or *Tangoot*, and by the Chinese *Tsang*, is situated between 26^o and 30^o north latitude; and, according to Abbé Groser, is reckoned to be 640 leagues from east to west, and 650 from north to south. It is bounded on the north by the country of the Mongols and the desert of Kobi; on the east by China; on the west by Hindostan, and on the south by the same country and the kingdom of Ava. In the valleys lying between the lower mountains are many tribes of Indian people; and a dispute happening between the heirs of one of the rajahs or petty princes, one party called to their assistance the Boutanais, and the other the British. The latter prevailed; and the fame of British valour being carried to the court of Tinet, the Teeloo-Lama, who ruled the state under the Delai-Lama, at that time in his minority, sent a deputation to Bengal, desiring peace for the prince who had been engaged in war with the British. This was readily granted by the governor; and Mr Bogle was sent ambassador to the court of Tibet, where he resided several months; and after an absence of a year and a quarter, returned to Calcutta. The account of this gentleman's expedition hath not been published by himself; but from Mr Stewart's letter to Sir John Pringle, published in the Philosophical Transactions, vol. 67. we learn the following particulars, collected from his papers.

"Mr Bogle divides the territories of the Delai-Lama into two different parts. That which lies immediately contiguous to Bengal, and which is called by the inhabitants *Doopo*, he distinguishes by the name of *Bootan*; and the other, which extends to the northward as far as the frontiers of Tartary, called by the natives *Pu*, he styles *Tibet*. *Bootan* is ruled by the Dah Terriah, or Deb Rajah. It is a country of steep and inaccessible mountains, whose summits are crowned with eternal snow; they are intersected with deep valleys, through which pour numberless torrents that increase in their course, and at last, gaining the plains, lose themselves in the great rivers of Bengal. These mountains are covered down their sides with forests of stately trees of various sorts; some (such as pines, &c.) which are known in Europe; others, such as are peculiar to the country and climate. The valleys and sides of the hills which admit of cultivation are not unfruitful, but produce crops of wheat, barley, and rice. The inhabitants are a stout and warlike people, of a copper complexion, in size rather

Tibet.

I bet.

above the middle European stature, hasty and quarrelsome in their temper, and addicted to the use of spirituous liquors; but honest in their dealings, robbery by violence being almost unknown among them. The chief city is Tassej Seddein situated on the Patehoo. Tibet begins properly from the top of the great ridge of the Caucasus, and extends from thence in breadth to the confines of Great Tartary, and perhaps to some of the dominions of the Russian empire. The woods, which everywhere cover the mountains in Boutan, are here totally unknown; and, except a few straggling trees near the villages, nothing of the sort to be seen. The climate is extremely severe and rude. At Chamnanning, where he wintered, although it be in latitude $31^{\circ} 39'$, only 8° to the northward of Calcutta, he often found the thermometer in his room at 29° by Fahrenheit's scale; and in the middle of April the standing waters were all frozen, and heavy showers of snow perpetually fell. This, no doubt, must be owing to the great elevation of the country, and to the vast frozen space over which the north wind blows uninterruptedly from the pole, through the vast deserts of Siberia and Tartary, till it is stopped by this formidable wall.

"The Tibetians are of a smaller size than their southern neighbours, and of a less robust make. Their complexions are also fairer, and many of them have even a ruddiness in their countenances unknown in the other climates of the east. Those whom Mr Bogle saw at Calcutta appeared to have quite the Tartar face. They are of a mild and cheerful temper; the higher ranks are polite and entertaining in conversation, in which they never mix either strained compliments or flattery. The common people, both in Bootan and Tibet, are clothed in coarse woollen stuffs of their own manufacture, lined with such skins as they can procure; but the better orders of men are dressed in European cloth, or China silk, lined with the finest Siberian furs. The use of linen is totally unknown among them. The chief food of the inhabitants is the milk of their cattle, prepared into cheese, butter, or mixed with the flour of a coarse barley or of pease, the only grain which their soil produces; and even these articles are in a scanty proportion: but they are furnished with rice and wheat from Bengal and other countries in their neighbourhood. They also are supplied with fish from the rivers in their own and the neighbouring provinces, salted and sent into the anterior parts. They have no want of animal food from the cattle, sheep, and hogs, which are raised on their hills; and are not destitute of game. They have a singular method of preparing their mutton, by exposing the carcass entire, after the bowels are taken out, to the sun and bleak northern winds which blow in the months of August and September, without frost, and so dry up the juices and parch the skin, that the meat will keep uncorrupted for the year round. This they generally eat raw, without any other preparation.

"The religion and political constitution of this country, which are intimately blended together, would make a considerable chapter in its history. It suffices to say, that at present, and ever since the expulsion of the Eluth Tartars, the kingdom of Tibet is regarded as depending on the empire of China, which they call *Cathay*; and there actually reside two mandarines, with a garrison of a thousand Chinese, at Lahassa the capital, to support the government; but their power does not extend far: and in fact the Lama, whose empire is founded on the surest grounds, personal affection and religious reverence, governs every thing internally with unbounded authority. Every body knows that the Delai Lama is the great object of adoration for the various tribes of heathen Tartars, who roam through the vast tract of continent which stretches from the banks

of the Volga to Corea on the sea of Japan, the most extensive religious dominion, perhaps, on the face of the globe. See LAMA.

"It is an old notion, that the religion of Tibet is a corrupted Christianity: and even Father Disederii, a Jesuit (but not of the Chinese mission) who visited the country about the beginning of this century, thinks he can resolve all their mysteries into ours; and asserts, with a truly mystical penetration, that they have certainly a good notion of the Trinity, since in their address to the Deity, they say as often *konciok-oik* in the plural as *konciok* in the singular, and with their rosaries pronounce these words, *om, ha, hum*. The truth is, that the religion of Tibet, from whatever source it sprung, is pure and simple in its source, conveying very exalted notions of the Deity, with no contemptible system of morality: but in its progress it has been greatly altered and corrupted by the inventions of worldly men; a fate we can hardly regret in a system of error, since we know that that of truth has been subject to the same. Polygamy, at least in the sense we commonly receive the word, is not in practice among them; but it exists in a manner still more repugnant to European ideas; for there is a plurality of husbands, which is firmly established and highly respected there. In a country where the means of subsisting a family are not easily found, it seems not impolitic to allow a set of brothers to agree in raising one, which is to be maintained by their joint efforts. In short, it is usual in Tibet for the brothers in the family to have a wife in common, and they generally live in great harmony and comfort with her; not but sometimes little dissensions will arise (as may happen in families constituted upon different principles), an instance of which Mr Bogle mentions in the case of a modest and virtuous lady, the wife of half a dozen of the Teeshoo Lama's nephews, who complained to the uncle that the two youngest of her husbands did not furnish that share of love and benevolence to the common stock which duty and religion required of them. In short, however strange this custom may appear to us, it is an undoubted fact that it prevails in Tibet.

"The manner of bestowing their dead is also singular: they neither put them in the ground like the Europeans, nor burn them like the Hindoos; but expose them on the bleak pinnacle of some neighbouring mountain, to be devoured by wild beasts and birds of prey, or wasted away by time and the vicissitudes of the weather in which they lie. The mangled carcasses and bleached bones lie scattered about; and amidst this scene of horror, some miserable old wretch, man or woman, lost to all feelings but those of superstition, generally sets up an abode, to perform the dismal office of receiving the bodies, assigning each a place, and gathering up the remains when too widely dispersed."

To the account of Tibet which we have given from the communications of Mr Bogle, we may add the information which we have obtained from a later traveller, Mr Saunders* * *Pap. the Phi Transf. l. XXI.* surgeon at Boglepoer in Bengal, who made a journey into Tibet in the year 1783. His observations chiefly respect the natural productions and diseases of the country.

The plants which Mr Saunders found were almost all European plants, a great number of them being natives of Britain. From the appearance of the hills he concludes that they must contain many ores of metal and pyrites. There are inexhaustible quantities of TISCAL (see that article), and rock-salt is plentiful; gold-dust is found in great quantities in the beds of rivers, and sometimes in large masses, lumps, and irregular veins; lead, cinnabar containing a large proportion of quicksilver, copper, and iron, he thinks, might easily be procured. But the inhabitants of Tibet have no better fuel than the dung of animals. A coal mine

mine would be a valuable discovery. We are told, that in some parts of China bordering on Tibet coal is found and used as fuel.

It is remarkable that the same disease prevails at the foot of the mountains of Tibet as in Switzerland at the foot of the Alps, a glandular swelling in the throat commonly called *goitre*. This disease has been ascribed to the use of snow-water, which flows down in streams from the mountains in both countries. But in many countries where snow-water is abundant it does not prevail, and in other places far remote from snow it is not unfrequent, as in Sumatra. Mr Saunders thinks that it arises from the air peculiar to the vicinity of certain mountains; and finding the vegetable productions of the mountains of Tibet the same with those of the Alps, that they also may have their influence. An analysis of the water where this disease prevails might throw some light on the subject. We have heard it attributed to the impregnation of water with *tufa*. This very extraordinary disease has been little attended to, from obvious reasons; it is unaccompanied with pain, seldom fatal, and generally confined to the poorer sort of people. The tumor is insidiously, and grows to a troublesome size, being often as large as a person's head. It is certainly not exaggerating to say, that one in six of the Rungpore district, and country of Bootan, has the disease.

As those who labour most, and are the least protected from the changes of weather, are most subject to the disease, we universally find it in Bootan more common with the women than men. It generally appears in Bootan at the age of thirteen or fourteen, and in Bengal at the age of eleven or twelve: so that in both countries the disease shows itself about the age of puberty. I do not believe this disease has ever been removed, though a mercurial course seemed to check its progress, but did not prevent its advance after intermitting the use of mercury. An attention to the primary cause will first lead to a proper method of treating the disease; a change of situation for a short while, at that particular period when it appears, might be the means of preventing it.

The venereal disease is not uncommon in Tibet; and what will perhaps surprize the physician, the inhabitants are acquainted with the effects of mercury, and with a method of preparing it so as to render it a safe and efficacious remedy. They know how to deprive it of its metallic form by mixing it with alum, nitre, and vermilion, and exposing it to a certain degree of heat, which they judge of by weighing the fuel.

The language spoken in Tibet is different from that of the Tartars. The astronomers are acquainted with the motion of the heavenly bodies, and able to calculate eclipses: but the lamas are generally ignorant; few of them can read, much less understand their ancient books.

TIBULLUS (Anlus Albius), a Roman knight, and a celebrated Latin poet, was born at Rome 43 B. C. He was the friend of Horace, Ovid, Maecius, and other great men in the reign of Augustus. He accompanied Messala Corvinus in his expedition against the island of Coreyra: but falling sick, and being unable to support the fatigues of war on account of the weakness of his constitution, he quitted the profession of arms, and returned to Rome, where he died before the year 17; when Ovid showed his grief for his death by writing a fine elegy upon him. Tibullus wrote four books of elegies, which are still extant: they are written in a tender and agreeable style, and in very elegant Latin. Muræus and Joseph Scaliger have written learned and curious commentaries on the works of this poet. The best edition of Tibullus is that of Janus Bronckhusius, published at Amsterdam in 1708, in one

volume quarto. We have an English poetical version by Mr Grainger.

TIBUR, (anc. geog.) a town of Latium, pleasantly situated on the Anio. Here Horace had his villa and house; and here he wished to end his days. Here Adrian built an extraordinary villa called *Tiburina*, inscribed with the names of the provinces and of the most considerable places, (Spartian); near which Zenobia had a house called *Zenobia*, (Trebellius, Pollio). Hither Augustus often retreated on account of its salubrity, (Sustorius): for which it is greatly commended, (Martialis). Anciently, when the Romans had far extended their territory, it was the utmost place of banishment, (Ovid). It had a temple of Hercules; and therefore called *Herculeum*. In the temple was a library, (A. Gellius). Now *Tivoli* in the Campagna di Roma on the Teverone.

TICINUS, (anc. geog.) a river in Infubria, rising in mount Adula, traversing the Lacus Verbanus southwards, and falling into the Po near Ticinum. Between this river and the Po Hannibal gained his first victory over the Romans under P. Scipio. The general himself escaped with the utmost difficulty, and that by the bravery of his son the first Scipio Africanus. Now the *Tesino*, rising in mount Godard, running south through the Lago Maggiore and Milan, by Pavia, into the Po.

TICK, in zoology. See ACARUS.

TICKELL (Thomas), an excellent English poet, was the son of the Reverend Richard Tickell, and was born in 1686, at Bridekirk in Cumberland. He was educated at Queen's college, Oxford, of which he was made fellow; and while he continued at that university, he addressed to Mr Addison a complimentary copy of verses on his Opera of Rosamond, which introduced him to an acquaintance with that gentleman, who discovering his merit, became his sincere friend. On Mr Addison's being made secretary of state, he appointed Mr Tickell his under-secretary; and on his being obliged to resign that office on account of his ill health, he recommended him so effectually to Mr Craeg's successor, that he was continued in his post till that gentleman's death. In 1724 Mr Tickell was appointed secretary to the lords justices in Ireland, and enjoyed that place as long as he lived. He wrote some poems, which, when separately published, met with a favourable reception, and passed through several editions: they are now printed in the second volume of The Minor Poets. After Mr Addison's death Mr Tickell had the care of the edition of his works printed in 4 vols 4to; to which he prefixed an account of Mr Addison's life, and a poem on his death. Mr Tickell died in the year 1740.

TICKERA, a considerable article of merchandise in Fezzan in Africa; it is valued by travellers as a portable and highly salubrious food. It is a preparation of pounded dates, and the meal of Indian corn, formed into a paste, and highly dried in an oven.

TICKSEED, SUN-FLOWER. See COREOPSIS.

TICUNAS. See POISON, p. 266.

TIDE, is a word which expresses that rising and falling of the waters which are observed on all maritime coasts.

There is a certain depth of the waters of the ocean which would obtain if all were at rest: but observation shows that they are continually varying from this level, and that some of these variations are regular and periodical.

1/2. It is observed, that on the shores of the ocean, and in bays, creeks, and harbours, which communicate freely with the ocean, the waters rise up above this mean height twice a-day, and as often sink below it, forming what is called a FLOOD and an EBB, a HIGH and a LOW WATER. The whole interval between high and low water is called a TIDE;

Tide. the water is said to FLOW and to EBB; and the rising is called the FLOOD-TIDE, and the falling is called the EBB TIDE.

2^d. It is observed, that this rise and fall of the waters is variable in quantity. At Plymouth, for instance, it is sometimes 21 feet between the greatest and least depth of the water in one day, and sometimes only 12 feet.

These different heights of tide are observed to succeed each other in a regular series, diminishing from the greatest to the least, and then increasing from the least to the greatest. The greatest is called a SPRING TIDE, and the least is called a NEAP TIDE.

3^d. This series is completed in about 15 days. More careful observation shows that two series are completed in the exact time of a lunation. For the spring tide in any place is observed to happen precisely at a certain interval of time (generally between two and three days) after new or full moon, and the neap tide at a certain interval after half moon; or, more accurately speaking, it is observed that the spring tide always happens when the moon has got a certain number of degrees eastward of the line of conjunction and opposition, and the neap tide happens when she is a certain number of degrees from her first or last quadrature. Thus the whole series of tides appears to be regulated by the moon.

4th. It is observed that high water happens at new and full moon when the moon has a certain determined position with respect to the meridian of the place of observation, preceding or following the moon's southing a certain interval of time; which is constant with respect to that place, but very different in different places.

5th. The time of high water in any place appears to be regulated by the moon; for the interval between the time of high water and the moon's southing never changes above three quarters of an hour, whereas the interval between the time of high water and noon changes six hours in the course of a fortnight.

6th. The interval between two succeeding high waters is variable. It is least of all about new and full moon, and greatest when the moon is in her quadratures. As two high waters happen every day, we may call the double of their interval a TIDE DAY, as we call the diurnal revolution of the moon a lunar day. The tide day is shortest about new and full moon, being then about 24^h 37'; about the time of the moon's quadratures it is 25^h 27'. These values are taken from a mean of many observations made at Barbadoes by Dr Maskelyne.

7th. The tides in similar circumstances are greatest when the moon is at her smallest distance from the earth, or in her perigee, and, gradually diminishing, are smallest when she is in her apogee.

8th. The same remark is made with respect to the sun's distance, and the greatest tides are observed during the winter months of Europe.

9th. The tides in any part of the ocean increase as the moon, by changing her declination, approaches the zenith of that place.

10th. The tides which happen while the moon is above the horizon are greater than the tides of the same day when the moon is below the horizon.

Such are the regular phenomena of the tides. They are important to all commercial nations, and have therefore been much attended to. It is of the tides, in all probability, that the Bible speaks, when God is said to set bounds to the sea, and to say "this far shall it go, and no farther."

Homer is the earliest profane author who speaks of the tides. Indeed it is not very clear that it is of them that he speaks (in the XIth book of the *Odyssy*) when he speaks of

Charybdis, which rises and retires thrice in every day. Herodotus and Diodorus Siculus speak more distinctly of the tides in the Red Sea. Pytheas of Marseilles is the first who says any thing of their cause. According to Strabo he had been in Britain, where he must have observed the tides of the ocean. Plutarch says expressly that Pytheas ascribed them to the moon. It is somewhat wonderful that Aristotle says so little about the tides. The army of Alexander, his pupil, were startled at their first appearance to them near the Persian Gulph; and we should have thought that Aristotle would be well informed of all that had been observed there.

But there are only three passages concerning them in all Aristotle's writings, and they are very trivial. In one place he speaks of great tides observed in the north of Europe; in another, he mentions their having been ascribed by some to the moon; and in a third, he says, that the tide in a great sea exceeds that in a small one.

The Greeks had little opportunity of observing the tides. The conquests and the commerce of the Romans gave them more acquaintance with them. Cæsar speaks of them in the 4th book of his *Gallie War*. Strabo, after Posidonius, classes the phenomena into daily, monthly, and annual. He observes, that the sea rises as the moon gets near the meridian, whether above or below the horizon, and falls again as she rises or falls; also, that the tides increase at the time of new and full moon, and are greatest at the summer solstice. Pliny explains the phenomena at some length; and says, that both the sun and moon are their cause, dragging the waters along with them (B. II. c. 97). Seneca (*Nat. Quæst.* III. 28.) speaks of the tides with correctness; and Microbius (*Summ. Scip.* I. 6.) gives a very accurate description of their motions.

It is impossible that such phenomena should not excite human curiosity as to their cause. Plutarch (*Plaut. Phil.* III. 17), Galileo (*Syst. Munt. Dial.* 4.), Riccioli in his *Almagest*, ii. p. 374, and Gassendi, ii. p. 27. have collected most of the notions of their predecessors on the subject; but they are of so little importance, that they do not deserve our notice. Kepler speaks more like a philosopher (*De Stella Martis*, and *Epit. Astron.* p. 555). He says that all bodies attract each other, and that the waters of the ocean would all go to the moon were they not retained by the attraction of the earth; and then goes on to explain their elevation under the moon and on the opposite side, because the earth is less attracted by the moon than the nearer waters, but more than the waters which are more remote.

The honour of a complete explanation of the tides was reserved for Sir Isaac Newton. He laid hold of this class of phenomena as the most incontestable proof of universal gravitation, and has given a most beautiful and synoptical view of the whole subject; contenting himself, however, with merely exhibiting the chief consequences of the general principle, and applying it to the phenomena with singular address. But the wide steps taken by this great philosopher in his investigation leave ordinary readers frequently at fault: many of his assumptions require the greatest mathematical knowledge to satisfy us of their truth. The academy of Paris therefore proposed to illustrate this among other parts of the principles of natural philosophy, and published the theory of the tides as a prize problem. This produced three excellent dissertations, by M^r Laurin, Dan. Bernoulli, and Euler. Aided by these, and chiefly by the second, we shall here give a physical theory, and accommodate it to the purposes of navigation by giving the rules of calculation. We have demonstrated in our dissertations on the physical principles of the celestial motions, that it is an unexcepted fact, that every particle of matter in the solar system is actually deflected toward every other particle; and that

that the deflection of a particle of matter toward any distant sphere is proportional to the quantity of matter in that sphere directly, and to the square of the distance of the particle from the centre of that sphere inversely: and having found that the heaviness of a piece of terrestrial matter is nothing but the supposed opponent to the force which we exert in carrying this piece of matter, we conceive it as possessing a property, that is, distinguishing quality, manifested by its being *gravis* or heavy. This is heaviness, *gravitas*, gravity; and the manifestation of this quality, or the exert in which it is seen, whether it be directly falling, or deflecting in a parabolic curve, or stretching a coiled spring, or breaking a rope, or simply pressing on its support, is *gravitatio*, gravitation; and the body is said to gravitate. When all obstacles are removed from the body, as when we cut the string by which a stone is hung, it moves directly downwards, *tendit ad se ram*. *Si discindatur funis, tenderet lapis ad terram. Dum vero funis integer perstet, lapis terram versus nititur censetur*. By some metaphysical process, which it is needless at present to trace, this *nisus ad motum* has been called a *tendency* in our language. Indeed the word has now come to signify the energy of any active quality in those cases where its simplest and most immediate manifestation is prevented by some obstacle. The stone is now said to tend toward the earth, though it does not actually approach it, being withheld by the string. The stretching the string in a direction perpendicular to the horizon is conceived as a full manifestation of this tendency. This tendency, this energy of its heaviness, is therefore named by the word which distinguishes the quality; and it is called *gravitation*, and it is said to *gravitate*.

But Sir Isaac Newton discovered that this deflection of a heavy body differs in no respect from that general deflection observed in all the bodies of the solar system. For 16 feet, which is the deflection of a stone in one second, has the very same proportion to $\frac{1}{17}$ th of an inch, which is the simultaneous deflection of the moon, that the square of the moon's distance from the centre of the earth has to the square of the stone's distance from it, namely, that of 3600 to 1.

Thus we are enabled to compare all the effects of the mutual tendencies of the heavenly bodies with the tendency of gravity, whose effects and measures are familiar to us.

If the earth were a sphere covered to a great depth with water, the water would form a concentric spherical shell; for the gravitation of every particle of its surface would then be directed to the centre, and would be equal. The curvature of its surface therefore would be every where the same, that is, it would be the uniform curvature of a sphere.

It has been demonstrated in former articles, after Sir Isaac Newton, that the gravitation of a particle C (fig. 1.) to the centre O, is to that of a particle E at the surface as CO to EO . In like manner the gravitation of o is to that of p as oO to pO . If therefore EO and Op are two communicating canals, of equal lengths, the water in both would be in equilibrio, because each column would exert the same total pressure at O. But if the gravitation of each particle in pO be diminished by a certain proportion, such as $\frac{1}{50}$ th of its whole weight, it is plain that the total pressure of the column pO will be $\frac{1}{50}$ th part less than that of the column EO . Therefore they will no longer be in equilibrio. The weight of the column EO will prevail; and if a hollow tower Pp be built at the mouth of the pit po , the water will sink in EO and rise in Op , till both are again in equilibrio, exerting equal total pressures at O. Or we may prevent the sinking at E by pouring in more water into the tower Pp . The same thing must happen in the canal fc perpendicular to EO , if the gravitation of every

particle be diminished by a force acting in the direction CF , and proportional to the distance of the particle from C, and such, that when cC is equal to oO , the force acting on c is equal to the force acting on o . In order that the former equilibrium may be restored after this diminution of the gravitation of the column fc , it is plain that more water must be poured into the oblique tower Ff . All this is evident when we consider the matter hydrostatically. The gravitation of the particle c may be represented by oO ; but the diminution of the pressure occasioned by this at O is represented by Cc .

Hence we can collect this much, that the whole diminution of pressure at C is to the whole diminution of pressure at O as the sum of all the lines cC to the sum of all the lines oO , that is, as fC^2 to pO^2 . But the weight of the small quantity of water added in each tower is diminished in the same proportion; therefore the quantity added at Ff must be to the quantity added at Pp as fC to pO . Therefore we must have $Ff : Pp = fC : pO$, and the points E, F, P, must be in the circumference of an ellipse, of which PO and EO are the transverse and conjugate semiaxes.

What we have here supposed concerning the diminution of gravity in these canals is a thing which really obtains in nature. It was demonstrated, when treating of the *Precession of the Equinoxes*, that if the sun or moon lie in the direction OP, at a very great distance, there results from the unequal gravitation of the different particles of the earth a diminution of the gravity of each particle; which diminution is in a direction parallel to OP, and proportional to the distance of the particle from a plane passing through the centre of the earth at right angles to the line OP.

Thus it happens that the waters of the ocean have their equilibrium disturbed by the unequal gravitation of their different particles to the sun or to the moon; and this equilibrium cannot be restored till the waters come in from all hands, and rise up around the line joining the centres of the earth and of the luminary. The spherical ocean must acquire the form of a prolate spheroid generated by the revolution of an ellipse round its transverse axis. The waters will be highest in that place which has the luminary in its zenith, and in the antipodes to that place; and they will be most depressed in all those places which have the luminary in their horizon. P and P' will be the poles, and EOQ will be the equator of this prolate spheroid.

Mr Ferguson, in his *Astronomy*, assigns another cause of this arrangement, *viz.* the difference of the centrifugal forces of the different particles of water, while the earth is turning round the common centre of gravity of the earth and moon. This, however, is a mistake. It would be just if the earth and moon were attached to the ends of a rod, and the earth kept always the same face toward the moon.

It is evident that the accumulation at P and P', and the depression at the equator, must augment and diminish in the same proportion with the disturbing force. It is also evident that its absolute quantity may be discovered by our knowledge of the proportion of the disturbing force to the force of gravity.—Now this proportion is known; for the proportion of the gravitation of the earth's centre to the sun or moon, to the force of gravity at the earth's surface, is known; and the proportion of the gravitation of the earth's centre to the luminary, to the difference of the gravitations of the centre and of the surface, is also known, being very nearly the proportion of the distance of the luminary to twice the radius of the earth.

Although this reasoning, by which we have ascertained the elliptical form of the watery spheroid, be sufficiently convincing, it is very imperfect, being accommodated to one condition only of equilibrium, *viz.* the equilibrium of the canals

Tide. canals fc and co . There are several other conditions equally necessary to which this lax reasoning will not apply, such as the direction of the whole remaining gravitation in any point F. This must be perpendicular to the surface, &c. &c. Nor will this mode of investigation ascertain the eccentricity of the spheroid without a most intricate process. We must therefore take the subject more generally, and show the proportion and directions of gravity in every point of the spheroid. We need not, however, again demonstrate that the gravitation of a particle placed any where without a perfect spherical shell, or a sphere consisting of concentric spherical shells, either of uniform density, or of densities varying according to some function of the radius, is the same as if the whole matter of the shell or sphere were collected in the centre. This has been demonstrated in the article ASTRONOMY. We need only remind the reader of some consequences of this theorem which are of continual use in the present investigation.

1st, The gravitation to a sphere is proportional to its quantity of matter directly, and to the square of the distance of its centre from the gravitating particle inversely.

2^d, If the spheres be homogeneous and of the same density, the gravitations of particles placed on their surfaces, or at distances which are proportional to their diameters, are as the radii; for the quantities of matter are as the cubes of the radii, and the attractions are inversely as the squares of

the radii; and therefore the whole gravitations are as $\frac{r^3}{r^2}$, or as r .

3^d, A particle placed within a sphere has no tendency to the matter of the shell which lies without it, because its tendency to any part is balanced by an opposite tendency to the opposite part. Therefore,

4th, A particle placed any where within a homogeneous sphere gravitates to its centre with a force proportional to its distance from it.

It is a much more difficult problem to determine the gravitation of particles to a spheroid. To do this in general terms, and for every situation of the particle, would require a train of propositions which our limits will by no means admit; we must content ourselves with as much as is necessary for merely ascertaining the ratio of the axes. This will be obtained by knowing the ratio of the gravitation at the pole to that at the equator. Therefore

Let $NmsqN$ (fig. 2) be a section through the axis of an oblate homogeneous spheroid, which differs very little from a sphere. NS is the axis, mq is the equatorial diameter, O is the centre, and $NMSQ$ is the section of the inscribed sphere. Let P be a particle situated at any distance without the sphere in its axis produced; it is required to determine the gravitation of this particle to the whole matter of the spheroid?

Draw two lines PAC , PBD , very near to each other, cutting off two small arches AB , CD ; draw GAa , HBb , ICc , KDd , perpendicular to the axis; also draw OE and AL perpendicular to PAC , and OF perpendicular to PD , cutting PC in f . Join OA .

Let OA , the radius of the inscribed sphere, be r , and OP the distance of the gravitating particle be d , and Mm , the elevation of the equator of the spheroid, or the ellipticity, be e . Also make $AE = x$, and $OE = y$, $= \sqrt{r^2 - x^2}$.

Then $AE - BF = x$ and $Ff = y$, $= \frac{x \cdot x}{\sqrt{r^2 - x^2}}$.

Suppose the whole figure to turn round the axis OP . The little space $ABba$ will generate a ring of the redundant matter; so will $CDdc$. This ring may be consider-

ed as consisting of a number of thin rings generated by the revolution of Aa . The ring generated by Aa is equal to a parallelogram whose base is the circumference described by A and whose height is Aa . Therefore let c be the circumference of a circle whose radius is 1. The ring will be $Aa \times c \times AG$. But because maN is an arch of an ellipse, we have $Mm : Aa = MO : AG = r : AG$, and $Aa = Mm \times \frac{AG}{r} = \frac{e}{r} AG$. Therefore the surface of this ring is $c \frac{e}{r} AG^2$.

We have supposed the spheroid to be very nearly spherical, that is, e exceedingly small in comparison of r . This being the case, all the particles in Aa , and consequently all the particles in the ring generated by the revolution of Aa , will attract the remote particle P with the same force that A does very nearly. We may say the same thing of the whole matter of the ring generated by the revolution of $ABba$. This attraction is exerted in the direction PA by each individual particle. But every action of a particle A is accompanied by the action of a particle A' in the direction PA' . These two compose an attraction in the direction PO . The whole attraction in the directions similar to PA is $= c \times \frac{e}{r} \frac{AG^2}{PA^2} \times GH$, for GH measures the number of parallel plates of which the solid ring is composed.

This being decomposed in the direction PG is $= c \times \frac{e}{r} \times \frac{AG^2 \cdot PG}{PA^3} \times GH$. But $\frac{AG^2}{PA^2} = \frac{OE^2}{PO^2}$, and $\frac{PG}{PA} = \frac{PE}{PO}$. Therefore the attraction of the ring, estimated in the direction PO , is $= c \times \frac{e}{r} \times \frac{OE^2 \cdot PE}{PO^3} \times GH$.

Farther, by the nature of the circle, we have $HG : AB = AG : AO$; also $AB : BL = AO : OE$. But $PA : AG = PO : OE$, and $OE = \frac{AG \times PO}{PA}$. Therefore

$AB : BL = AO : \frac{AG \cdot PO}{PA}$, $= AO \cdot PA : PO \cdot AG$

Also $BL : LA = EO : EA$,
And $LA : Ff = PA : Pf$, $=$ ultimately $PA : PE$. Therefore, by equality, $HG : Ff = AG \cdot AO \cdot PA \cdot EO \cdot PA : AO \cdot PO \cdot AG \cdot EA \cdot PE$.

Or $HG : Ff = EO \cdot PA^2 : PO \cdot EA \cdot PE$.

And $HG = Ff \times \frac{EO \cdot PA^2}{PO \cdot PE \cdot EA}$.

Now substitute this value of HG in the formula expressing the attraction of the ring. This changes it to $c \frac{e}{r} \times \frac{OE^2 \cdot PE \cdot OE \cdot PA^2}{PO^3} \times \frac{e}{r} \times \frac{OE^3 \cdot PA^2}{PO^4 \cdot EA} \times Ff$. In like manner, the attraction of the ring generated by the revolution of $CDdc$ is $c \frac{e}{r} \times \frac{OE^3 \cdot PC^2}{PO^4 \cdot EA} \times Ff$. Therefore the attraction of both is $= c \frac{e}{r} \times Ff \times \frac{OE^3}{PO^3 \cdot EA} \times \overline{PA^2 + PC^2}$, $= c \frac{e}{r} \times Ff \frac{y^3}{d^3} \times \overline{PA^2 + PC^2}$. But $PA^2 + PC^2 = 2PE^2 + 2EA^2 = 2PE^2 + 2x^2$. Therefore the attraction is $2c \frac{e}{r d^3} \times Ff \frac{y^3}{x} \times \overline{PE^2 + x^2}$. But $Ff = y$, $= \frac{x}{y} \cdot x$. Therefore $Ff \frac{y^3}{x} = x \cdot x \cdot \frac{y^3}{x} = y^2 x$.

$= \sqrt{r^2 - x^2}$. Therefore the attraction of the two rings is $2c \frac{e}{r d^4} \times r^2 - x^2 \times \overline{PE^2 + x^2} \times x$. But $PE^2 = PO^2 - OE^2, = d^2 - (r^2 - x^2) = d^2 - r^2 + x^2$. Therefore the attraction of the two rings is

$$2c \frac{e}{r d^4} \times r^2 - x^2 \times \overline{d^2 - r^2 + 2x^2} \times x, = 2c \frac{e}{r d^4} \times \frac{r^2 d^2 x - r^4 x + 2r^2 x^2 x - d^2 x^2 x + r^2 x^2 x - 2x^4 x}{*} = 2c \frac{e}{r d^4} \times \frac{r^2 d^2 x + 3r^2 x^2 x - r^4 x - d^2 x^2 x - 2x^4 x}{*}$$

The attraction of the whole shell of redundant matter will be had by taking the fluent of this formula, which is $2c \frac{e}{r d^4} \times \left(r^2 d^2 x + \frac{3r^2 x^3}{3} - r^4 x - \frac{d^2 x^3}{3} - \frac{2x^5}{5} \right)$,

and then make $x=r$. This gives $2c \frac{e}{r d^4} (d^2 r^3 + r^5 - r^5 - \frac{1}{3} d^2 r^3 - \frac{2}{5} r^5)$, which is $= 2c \frac{e}{r d^4} (\frac{2}{3} d^2 r^3 - \frac{2}{5} r^5)$,

$= \frac{4ce r^2}{3 d^2} - \frac{4r^4}{5 d^4}$. To this add the attraction of the inscribed sphere, which is $\frac{c}{d^2} \frac{r^3}{d^2}$, and we have the attraction of the whole spheroid

$$= \frac{2}{3} \frac{c r^3}{d^2} + \frac{4}{5} \frac{c e r^2}{d^2} - \frac{4}{5} \frac{c e r^4}{d^4}$$

Cor. 1. If the particle P is situated precisely in N, the pole of the spheroid, the attraction of the spheroid, is $\frac{2}{3} c r + \frac{8}{15} c e$.

If the spheroid is not oblate, but oblong, and if the greater semiaxis be r , and the depression at the equator be e , the analysis is the same, taking e negatively. Therefore the attraction of a particle in the pole, or the gravitation of a particle in the pole, is $\frac{2}{3} c r - \frac{8}{15} c e$.

But if the polar semiaxis be $r + e$, and the equatorial radius be r , so that this oblong spheroid has the same axis with the former oblate one, the gravitation of a particle in the pole is $\frac{2}{3} c r + \frac{8}{15} c e$.

Cor. 2. If a number of parallel planes are drawn perpendicular to the equator of an oblong spheroid, whose longer semiaxis is $r + e$, and equatorial radius r , they will divide the spheroid into a number of similar ellipses; and since the ellipse through the axis has $r + e$ and r for its two semiaxes, and the radius of a circle of equal area with this ellipse is a mean proportional between r and $r + e$, and therefore very nearly $= r + \frac{1}{2} e$, when e is very small in comparison of r , a particle on the equator of the oblong spheroid will be as much attracted by these circles of equal areas, with their corresponding ellipses, as by the ellipses. Now the attraction at the pole of an oblate spheroid was $\frac{2}{3} c r + \frac{8}{15} c e$. Therefore putting $\frac{1}{2} e$ in place of e , the attraction on the equator of the oblong spheroid will be equal to $\frac{2}{3} c r + \frac{4}{15} c e$.

Thus we have ascertained the gravitations of a particle situated in the pole, and of one situated in the equator, of a homogeneous oblong spheroid. This will enable us to solve the following problem:

If the particles of a homogeneous oblong fluid spheroid attract each other with a force inversely as the squares of their distances, and if they are attracted by a very distant body by the same law, and if the ratio of the equatorial gravity to this external force be given; to find what must be the proportion of the semiaxis, so that all may be in equilibrio, and the spheroid preserve its form?

Let r be the equatorial radius, and $r + e$ be the polar semiaxis. Then the gravitation at the pole m is $\frac{2}{3} c r + \frac{8}{15} c e$,

and the gravitation at the equator is $\frac{2}{3} c r + \frac{4}{15} c e$. Now by the gravitation towards the distant body placed in the direction of the polar axis, the polar gravitation is diminished, and the equatorial gravitation is increased; and the increase of the equatorial gravitation is to the diminution of the polar gravitation as NO to $2mO$. Therefore if the whole attraction of the oblong spheroid for a particle on its equator be to the force which the distant body exerts there, as G to P , and if the spheroid is very nearly spherical, the absolute weight at the equator will be $\frac{2}{3} c r + \frac{4}{15} c e + \frac{2}{3} c r \frac{P}{G}$. And the absolute weight at the pole will

be $\frac{2}{3} c r + \frac{8}{15} c e - \frac{2}{3} c r \frac{P}{G}$. Their difference is $\frac{2}{15} c e + 2 c r \frac{P}{G}$.

Now if we suppose this spheroid to be composed of similar concentric shells, all the forces will decrease in the same ratio. Therefore the weight of a particle in a column reaching from the equator to the centre will be to the weight of a similarly situated particle or a column reaching from the pole to the centre, as the weight of a particle at the equator to the weight of a particle at the pole. But the whole weights of the two columns must be equal, that they may balance each other at the centre. Their lengths must therefore be reciprocally as the weights of similarly situated particles; that is, the polar semiaxis must be to the equatorial radius, as the weight of a particle at the equator to the weight of a particle at the pole. Therefore we must have $\frac{2}{15} c e + 2 c r \frac{P}{G} : \frac{2}{3} c r + \frac{8}{15} c e - \frac{2}{3} c r \frac{P}{G} = e : r$.

Hence we derive $2 r \frac{P}{G} = \frac{8}{15} e$, or $4 G : 15 P = r : e$. This determines the form of the fluid spheroid when the ratio of G to P is given.

It is well known that the gravitation of the moon to the earth is to the disturbing force of the sun a 178,725 to 1 very nearly. The lunar gravitation is increased as she approaches the earth in the reciprocal duplicate ratio of the distances. The disturbing force of the sun diminishes in the simple ratio of the distances; therefore the weight of a body on the surface of the earth is to the disturbing force of the sun on the same body, in a ratio compounded of the ratio of 178,725 to 1, the ratio of 3600 to 1, and the ratio of 60 to 1; that is, in the ratio of 38604600 to 1. If the mean radius of the earth be 20934500 feet, the difference of the axis, or the elevation of the pole of the watery spheroid produced by the gravitation to the sun, will be $\frac{1}{2} \times \frac{38604600}{3600 \times 178725}$ feet, or very nearly $24\frac{1}{2}$ inches. This is the tide produced by the sun on a homogeneous fluid sphere.

It is plain, that if the earth consists of a solid nucleus of the same density with the water, the form of the solar tide will be the same. But if the density of the nucleus be different, the form of the tide will be different, and will depend both on the density and on the figure of the nucleus.

If the nucleus be of the same form as the surrounding fluid, the whole will still maintain its form with the same proportion of the axis. If the nucleus be spherical, its action on the surrounding fluid will be the same as if all the matter of the nucleus by which it exceeds an equal bulk of the fluid were collected at the centre. In this case, the ocean cannot maintain the same form: for the action of this central body being proportional to the square of the distance inversely, will augment the gravity of the equatorial fluid more than it augments that of the circumpolar fluid; and the ocean, which was in equilibrio (by supposition), must now become more protuberant at the poles. It may, however,

Tide.

ever, be again balanced in an elliptical form, when it has acquired a just proportion of the axes. The process for determining this is tedious, but precisely similar to the preceding.

If the density of the nucleus exceed that of the fluid about $\frac{1}{5\frac{1}{2}}$, we shall have $r : c = G : 3 P$, which is nearly the form which has been determined for the earth, by the mensuration of degrees of the meridian, and by the vibration of pendulums. The curious reader will do well to consult the excellent dissertations by Clairaut and Boscovich on the Figure of the Earth, where this curious problem is treated in the most complete manner. Mr Bernoulli, in his dissertation on the Tides, has committed a great mistake in this particular. On the other hand, if the nucleus be less dense than the waters, or if there be a great central hollow, the elevation produced by the sun will exceed $24\frac{1}{2}$ inches.

It is needless to examine this any farther. We have collected enough for explaining the chief affections of the tides.

It is known that the earth is not a sphere, but swelled out at the equator by the diurnal rotation. But the change of form is so very small in proportion to the whole bulk, that it cannot sensibly affect the change of form afterwards induced by the sun on the waters of the ocean. For the disturbing force of the sun would produce a certain protuberance on a fluid sphere; and this protuberance depends on the ratio of the disturbing force to the force of gravity at the surface of this sphere. If the gravity be changed in any proportion, the protuberance will change in the same proportion. Therefore if the body be a spheroid, the protuberance produced at any point by the sun will increase or diminish in the same proportion that the gravity at this point has been changed by the change of form. Now the change of gravity, even at the pole of the terrestrial spheroid, is extremely small in comparison with the whole gravity. Therefore the change produced on the spheroid will not sensibly differ from that produced on the sphere; and the elevations of the waters above the surface, which they would have assumed independent of the sun's action, will be the same on the spheroid as on the sphere. For the same reason, the moon will change the surface already changed by the sun, in the same manner as she would have changed the surface of the undisturbed ocean. Therefore the change produced by both these luminaries in any place will be the same when acting together as when acting separately; and it will be equal to the sum, or the difference of their separate changes, according as these would have been in the same or in opposite directions.

Let us now consider the most interesting circumstances of the form of an elliptical tide, which differs very little from a sphere.

Let T (fig. 2.) be a point in the surface of the inscribed sphere, and let Z express the angular distance TOQ from the longer axis of the surrounding spheroid S m N q. Let TR, TW be perpendicular to the equatorial diameter and to the axis, so that they are the cosine and the sine of TOQ to the radius TO or QO. Let S q N be a section of the circumscribed sphere. Draw OT cutting the spheroid in Z and the circumscribed sphere in t. Also let s o n be a section of a sphere which has the same capacity with the spheroid, and let it cut the radius in r. Then,

1. The elevation TZ of the point Z of the spheroid above the inscribed sphere is $= Q q \times \text{cof.}^2 Z$, and the depression tZ below the circumscribed sphere is $= Q q \times \text{fin.}^2 Z$. Produce R t till it meet the surface of the spheroid in V. The minute triangle V t Z may be considered as a rectilinear, right-angled at Z, and therefore similar to OTR.

Therefore OT : TR = tV : tZ. But in the ellipse OQ, or O' t' : TR = Q q : tV. Therefore OT² : TR² = Q q : TZ, and TZ = $\frac{Q q \cdot \text{TR}^2}{\text{OT}^2} = Q q : \frac{Q q \times \text{cof.}^2 Z}{1} = Q q \times \text{cof.}^2 Z$.

And in the very same manner it may be shown, that tZ = $Q q \times \text{fin.}^2 Z$.

2 The elevation of the point T above another point T', whose angular distance TO' t' from the point T is 90°, is $= Q q \times \text{cof.}^2 Z - \text{fin.}^2 Z$. Call the angle QOT' Z. Then T' Z' = $Q q \times \text{cof.}^2 Z'$, and TZ - T' Z, = $Q q \times \text{cof.}^2 Z - \text{cof.}^2 Z'$. But the arch QT' is the complement of Q t', and therefore $\text{cof.}^2 Z' = \text{fin.}^2 Z$. Therefore TZ - T' Z = $Q q \times \text{cof.}^2 Z - \text{fin.}^2 Z$.

3. $Q o = \frac{1}{2} Q q$. For the inscribed sphere is to the spheroid as OQ to Oq. But the inscribed sphere is to the sphere s o n as OQ³ to Oo³. Therefore because the sphere s o n is equal to the spheroid S q N, we have OQ : Oq = OQ³ : Oo³, and Oo is the first of two mean proportionals between OQ and Oq. But Qq is very small in comparison with OQ. Therefore Qo is very nearly $\frac{1}{2}$ of Qq.

Since s o n is the sphere of equal capacity, it is the form of the undisturbed ocean. The best way therefore of conceiving the changes of form produced by the sun or moon, or by both together, is to consider the elevations or depressions which they produce above or below this surface. Therefore,

4. The elevation r Z of the point Z above the equicapacious sphere is evidently $= Q q \times \text{cof.}^2 Z - \frac{1}{2} Q q$. Also the depression r' Z of the point Z' is $= Q q \times \text{fin.}^2 Z' - \frac{1}{2} Q q$.

N. B. Either of these formulæ will answer for either the elevation above, or the depression below, the natural ocean: For if $\text{cof.}^2 Z$ is less than $\frac{1}{2}$, the elevation given by the formula will be negative; that is, the point is below the natural surface. In like manner, when $\text{fin.}^2 Z'$ is less than $\frac{1}{2}$, the depression is negative, and the point is above the surface. But if $\text{cof.}^2 Z$ be $= \frac{1}{2}$, or $\text{fin.}^2 Z' = \frac{1}{2}$, the point is in the natural surface. This marks the place where the spheroid and the equal sphere intersect each other, viz in P, the arch P o being $54^\circ 44'$ very nearly, and PS = $35^\circ 16'$.

Let S represent the whole elevation of the pole of the solar tide above its equator, or the difference between high and low water produced by the sun; and let M represent the whole elevation produced by the moon. Let x and y represent the zenith distances of the sun and moon with respect to any point whatever on the ocean. Then x and y will be the arches intercepted between that point and the summits of the solar and lunar tides. Then the elevation produced by both luminaries in that place is $S \cdot \text{cof.}^2 x - \frac{1}{2} S + M \cdot \text{cof.}^2 y - \frac{1}{2} M$; or, more concisely, $S \cdot \text{cof.}^2 x + M \cdot \text{cof.}^2 y - \frac{1}{2} S + M$, and the depression is $S \cdot \text{fin.}^2 x + M \cdot \text{fin.}^2 y - \frac{1}{2} S + M$.

Let the sun and moon be in the same point of the heavens. The solar and lunar tides will have the same axis; the cosines of x and y will each be 1, and the elevation at the compound pole will be $S + M - \frac{1}{2} S - \frac{1}{2} M = \frac{1}{2} S + M$. The depression at any point 90° from this pole will be $\frac{1}{2} S + M$, and the whole tide is S + M.

Let the moon be in quadrature, as in a (fig. 3). The appearance at s will be known, by considering that in this place the cosine of x is 1, and the cosine of y is 0. Therefore the elevation at s = $S - \frac{1}{2} S + M = \frac{1}{2} S - \frac{1}{2} M$. The depression at a = $S - \frac{1}{2} S + M = \frac{1}{2} S - \frac{1}{2} M$. The difference or whole tide = $\frac{S - M}{2}$.

In like manner, the whole elevation at a above the inscribed sphere is $M - S$.

Hence we see that the whole tide, when the moon is in quadrature, is the difference of S and M . We also see, that if M exceeds S , the water will be higher at a than at s . Now it is a matter of observation, that in the quadratures it is high water under the moon, and low water under the sun. It is also a matter of observation, that in the free ocean, the ebb tide, or the water at s , immediately under the sun, is below the natural surface of the ocean. Hence we must conclude, that $\frac{2}{3} S$ is less than $\frac{1}{3} M$, or that M is more than double of S . This agrees with the phenomena of nutation and precession, which seem to make $S = \frac{2}{3}$ of M .

In all other positions of the sun and moon, the place of high water will be different. It is high water where the sum of the elevations produced by both luminaries above the natural ocean is greatest; and the place of low water is where the depression below the natural ocean is greatest. Therefore, in order that it may be high water, we must have $S \cdot \text{cof.}^2 x + M \cdot \text{cof.}^2 y - \frac{1}{3} S + \frac{1}{3} M$ a maximum; or, neglecting the constant quantity $\frac{S + M}{3}$, we must have $S \cdot \text{cof.}^2 x + M \cdot \text{cof.}^2 y$ a maximum.

In like manner, to have low water in a place where the zenith distances of the sun and moon are v and w , we must have $S \cdot \text{fin.}^2 v + M \cdot \text{fin.}^2 w$ a maximum.

Lemma 1. If we consider the sines and cosines of angles as numeral fractions of the radius r , then we have $\text{cof.}^2 Z = \frac{1}{2} + \frac{1}{2} \text{cof.}^2 Z$, and $\text{fin.}^2 Z = \frac{1}{2} - \frac{1}{2} \text{cof.}^2 Z$.

Let ams (fig. 3.) be a quadrant of a circle of which O is the centre, and Os is the radius. On Os describe the semicircle Oms , cutting Om in M . Draw sM , and produce it till it cut the quadrant in n . Also draw MC to the centre of the semicircle, and MD and nd perpendicular to Os .

It is plain that sM is perpendicular to OM ; and if Os be radius, sM is the sine of the angle sOM , which we may call Z ; OM is its cosine; and because $Os : OM = OM : OD$, and $Os : OD = Os^2 : OM^2$, and OD may represent $\text{cof.}^2 Z$. Now $OD = OC + CD$. If $Os = r$, then $OC = \frac{1}{2}$. $CD = CM \cdot \text{cof.} MCD = CM \cdot \text{cof.} 2MOD = \frac{1}{2} \cdot \text{cof.} 2Z$. Therefore $\text{cof.}^2 Z = \frac{1}{2} + \frac{1}{2} \text{cof.} 2Z$.

In like manner, because $Os : sM = sM : sD$, sD is $\text{fin.}^2 Z$. This is evidently $= \frac{1}{2} - \frac{1}{2} \text{cof.} 2Z$.

Lemma 2. $\text{Cof.}^2 Z - \text{fin.}^2 Z = \text{cof.} 2Z$. For, because sM is perpendicular to OM , the arch sn is double of the arch sm , and because MD is parallel to nd , sD is $2sD$, and $dD = \text{fin.}^2 Z$. Therefore $Od = \text{cof.}^2 Z - \text{fin.}^2 Z$. But Od is the cosine of ns , and $\text{cof.} 2Z$, and $\text{cof.}^2 Z - \text{fin.}^2 Z = \text{cof.} 2Z$.

By the first Lemma we see, that in order that there may be high water at any place, when the zenith distances of the sun and moon are x and y , we must have $S \cdot \text{cof.} 2x + M \cdot \text{cof.} 2y$ a maximum.

That this may be the case, the fluxion of this formula must be $= 0$. Now we know that the fluxions of the cosines of two arches are as the sines of those arches. Therefore we must have $S \cdot \text{fin.} 2x + M \cdot \text{fin.} 2y = 0$, or $S \cdot \text{fin.} 2x = -M \cdot \text{fin.} 2y$, which gives us $\text{fin.} 2x : \text{fin.} 2y = M : S$.

In like manner, the place of low water requires $\text{fin.} 2v : \text{fin.} 2w = M : S$.

From this last circumstance we learn, that the place of low water is o , removed 90° from the place of high water; whereas we might have expected, that the spheroid would have been most protuberant on that side on which the moon is: For the sines of $2v$ and of $2w$ have the same proportion with the sines of $2x$ and of $2y$. Now we know that

the sine of the double of any arch is the same with the sine of the double of its complement. Therefore if low water be really distant 90° from high water, we shall have $\text{fin.} 2x : \text{fin.} 2y = \text{fin.} 2v : \text{fin.} 2w$. But if it is at any other place, the sines cannot have this proportion.

Now let s be the point of the earth's surface which has the sun in the zenith, and m the point which has the moon in the zenith. Let b be any other point. Draw Ob cutting the semicircle OMs in H . Make CM to CS as the disturbing force of the moon to that of the sun; and draw Sv parallel, and Sv, Mr perpendicular to OH . Join MH and MH . The angle HCs is double of the angle HOs , and MCH is double of MHs , or of its equal MOH . Because HMH is a semicircle, HM is perpendicular to MO . Therefore if OH be considered as radius, HM is the sine, and HM is the cosine of MHs . And Cr is $= MC \cdot \text{cof.} 2y = M \cdot \text{cof.} 2y$. And Cr is $SC \cdot \text{cof.} 2x$. Therefore tr or Sv is $= S \cdot \text{cof.} 2x + M \cdot \text{cof.} 2y$. Therefore tr or Sv will express the whole difference of elevation between b and the points that are 90 degrees from it on either side (by Lemma 2.); and if b be the place of high water, it will express the whole tide, because the high and low waters were shown to be 90° asunder. But when b is the place of high water, Sv is a maximum. Because the place of the moon, and therefore the point M , is given, Sv will be a maximum when it coincides with SM , and CH is parallel to SM .

This suggested to us the following new, and not insignificant, solution of the problem for determining the place of high water.

Let $sQogs$ (fig. 4. and 5.) be a section of the terraqueous globe, by a plane passing through the sun and moon, and let O be its centre. Let s be the point which is immediately under the sun, and m the place immediately under the moon. Bisect Os in C , and describe round C the circle $OMsLO$, cutting Om in M . Take Cs to represent the disturbing force of the moon, and make Cs to CS as the force of the moon to that of the sun (supposing this ratio to be known). Join MS , and draw CH parallel to it. Draw OHb , and $lOLb$ perpendicular to it. And lastly, draw CI perpendicular to SM . Then we say that m and its opposite m' are the places of high water, l and l' are the places of low water, MS is the height of the tide, and MI, SI are the portions of this tide produced by the moon and sun.

For it is plain, that in this case the line Sv of the last proposition coincides with MS , and is a maximum. We may also observe, that $MC : CS = \text{fin.} MSC : \text{fin.} SMC = \text{fin.} HCS : \text{fin.} MCH = \text{fin.} 2bOs : \text{fin.} 2bOn = \text{fin.} 2x : \text{fin.} 2y$, or $M : S = \text{fin.} 2x : \text{fin.} 2y$, agreeably to what was required for the maximum.

It is also evident, that $MI = MC \cdot \text{cof.} CMI = M \cdot \text{cof.} 2y$, and $SI = SC \cdot \text{cof.} ISC = S \cdot \text{cof.} 2x$; and therefore MS is the difference or elevation between b and the points l and l' , which are 90° from it, and is therefore the place of low water; that is, MS is the whole tide.

The elevation of every other point may be determined in the same way, and thus may the form of the spheroid be completely determined.

If we suppose the figure to represent a section through the earth's equator (which is the case when the sun and moon are in the equator), and farther suppose the two luminaries to be in conjunction, the ocean is an oblong spheroid, whose axis is in the line of the syzgies, and whose equator coincides with the six hour circle. But if the moon be in any other point of the equator, the figure of the ocean will be very complicated. It will not be any figure of revolution; because neither its equator (or most depressed part),

Title

part), nor its meridians, are circles. The most depressed part of its equator will be in that section through the axis which is perpendicular to the plane in which the luminaries are situated. And this greatest depression, and its shortest equatorial diameter, will be constant, while its other dimensions vary with the moon's place. We need not inquire more minutely into its form; and it is sufficient to know, that all the sections perpendicular to the plane passing thro' the sun and moon are ellipses.

This construction will afford us a very simple, and, we hope, a very perspicuous explanation of the chief phenomena of the tides. The well informed reader will be pleased with observing its coincidence with the algebraic solution of the problem given by Daniel Bernoulli, in his excellent dissertation on the Tides, which shared with M'Laurin and Euler the prize given by the Academy of Sciences at Paris, and with the ease and perspicuity with which the phenomena are deducible from it, being in some sort exhibited to the eye.

In our application, we shall begin with the simplest cases, and gradually introduce the complicating circumstances which accommodate the theory to the true state of things.

We begin, therefore, by supposing the earth covered, to a proper depth, with water, forming an ocean concentric with its solid nucleus.

In the next place, we suppose that this ocean adopts in an instant the form which is consistent with the equilibrium of gravity and the disturbing forces.

Thirdly, We suppose the sun stationary, and the moon to move eastward from him above $12\frac{1}{2}^{\circ}$ every day.

Fourthly, We suppose that the solid nucleus turns round its proper axis to the eastward, making a rotation in 24 solar hours. Thus any place of observation will successively experience all the different depths of water.

Thus we shall obtain a certain Succession of phenomena, precisely similar to the succession observed in nature, with this sole difference, that they do not correspond to the contemporaneous situations of the sun and moon. When we shall have accounted for this difference, we shall presume to think that we have given a just theory of the tides.

We begin with the simplest case, supposing the sun and moon to be always in the equator. Let the series begin with the sun and moon in conjunction in the line Os . In this case the points s , m , and h coincide, and we have high water at 12 o'clock noon and midnight.

While the moon moves from s to Q , Om cuts the upper semicircle in M ; and therefore CH , which is always parallel to MS , lies between MC and Cs . Therefore h is between m and s , and we have high water after 12 o'clock, but before the moon's southing. The same thing happens while the moon moves from o to q , during her third quarter.

But while the moon moves from her first quadrature in Q to opposition in o (as in fig. 5.), the line mO drawn from the moon's place, cuts the lower semicircle in M and CH , parallel to SM , again lies between M and s , and therefore h lies between m and o . The place of high water is to the eastward of the moon, and we have high water after the moon's southing. The same thing happens while the moon is moving from her last quadrature in q to the next syzygy. In short, the point H is always between M and s , and the place of high water is always between the moon and the nearest syzygy. The place of high water overtakes the moon in each quadrature, and is overtaken by the moon in each syzygy. Therefore during the first and third quarters, the place of high water gradually falls behind the moon for some time, and then gains upon her

again, so as to overtake her in the next quadrature. But during the second and fourth quarters, the place of high water advances before the moon to a certain distance, and then the moon gains upon it, and overtakes it in the next syzygy.

If therefore we suppose the moon to advance uniformly along the equator, the place of high water moves unequally, slowest in the times of new and full moon, and swiftest in the time of the quadratures. There must be some intermediate situations where the place of high water neither gains nor loses upon the moon, but moves with the same velocity.

The rate of motion of the point h may be determined as follows: Draw Ci , Sn , making very small and equal angles with HC and MS . Draw nC , and about S , with the distance Sn , describe the arch nv , which may be considered as a straight line perpendicular to nS , or to MS .

Then, because SM and Sn are parallel to CH and Ci , the points n and i are contemporaneous situations of M and H , and the arches nM , iH , are in the ratio of the angular motions of m and b . Also, because nv and nM are perpendicular to nS and nC , the angle vnM is equal to the angle SnC , or SMC . Also, because the angles nvm and MiC are right angles, and the angles vnM , CMI , are also equal, the triangles vnM , CMI , are similar. Therefore

$$nM : nv = MC : MI. \text{ And}$$

$$nv : iH = nS : iC, \text{ or } = MS : MC; \text{ therefore}$$

$$nM : iH = MS : MI. \text{ Therefore the angular motion}$$

of the moon is to the angular motion of the place of high water as MS to MI .

Therefore, when MS is perpendicular to SC , and the point I coincides with S , the motion of high water is equal to that of the moon. But when MS is perpendicular to SC , HC is also perpendicular to Cs , and the angle $h'Os$ is 45° , and the high water is in the octant. While the moon passes from s to m' , or the high water from s to h' , the point I falls between M and S , and the motion of high water is slower than that of the moon. The contrary obtains while the moon moves from m' to Q , or the high water from the octant to the quadrature.

It is evident, that the motion of h in the third quarter of the lunation, that is, in passing from o to q , is similar to its motion from s to Q . Also, that its motion from Q to o must retard by the same degrees as it accelerated in passing from s to Q , and that its motion in the last quarter from q to s is similar to its motion from Q to o .

At new and full moon the point I coincides with C , and the point M coincides with s . Therefore the motion of the high water at full and change is to the motion of the moon as sC to sS . But when the moon is in quadrature, I coincides with C , and M with o . Therefore the motion of the moon is to that of high water as OS to OC or sC . Therefore the motion of high water at full and change is to its motion in the quadratures as OS to Ss , or as the difference of the disturbing forces to their sum. The motion of the tide is therefore slowest in the syzygies and swiftest in the quadratures; yet even in the syzygies it passes the sun along with the moon, but more slowly.

Let the interval between the morning tide of one day and that of the next day be called a *tide-day*. This is always greater than a solar day, or 24 hours, because the place of high water is moving faster to the eastward than the sun. It is less than a lunar day, or 24h. 50', while the high water passes from the second to the third octant, or from the fourth to the first. It is equal to a lunar day when high water is in the octants, and it exceeds a lunar day while high water passes from the first to the second octant, or from the third to the fourth.

The difference between a solar day and a tide day is called, ..

called the PRIMING or the RETARDATION of the tides. This is evidently equal to the time of the earth's describing in its rotation an angle equal to the motion of the high water in a day from the sun. The smallest of these retardations is to the greatest as the difference of the disturbing forces to their sum. Of all the phenomena of the tides, this seems liable to the fewest and most inconsiderable derangements from local and accidental circumstances. It therefore affords the best means for determining the proportion of the disturbing forces. By a comparison of a great number of observations made by Dr Maskelyne at St Helena and at Barbadoes (places situated in the open sea), it appears that the shortest tide-day is 24h. 37', and the longest is 25h. 27'. This gives $M - S : M + S = 37 : 87$, and $S : M = 2 : 4.96$; which differs only 1 part in 124 from the proportion of 2 to 5, which Daniel Bernoulli collected from a variety of different observations. We shall therefore adopt the proportion of 2 to 5 as abundantly exact. It also agrees exactly with the phenomena of the nutation of the earth's axis and the precession of the equinoxes; and the astronomers affect to have deduced this proportion from these phenomena. But an intelligent reader of their writings will perceive more fineness than justice in this assertion. The nutation and precession do not afford phenomena of which we can assign the share to each luminary with sufficient precision for determining the proportion of their disturbing forces; and it is by means or many arbitrary combinations, and without necessity, that D'Alembert has made out this ratio. We cannot help being of opinion, that D'Alembert has accommodated his distribution of the phenomena to this ratio of 2 to 5, which Daniel Bernoulli (the best philosopher and the most candid man of that illustrious family of mathematicians) had, with so much sagacity and justness of inference, deduced from the phenomena of the tides. D'Alembert could not but see the value of this inference; but he wanted to show his own address in deducing it *proprio Marte* forsooth from the nutation and precession. His procedure in this resembles that of his no less vain countryman De la Place, who affects to be highly pleased with finding that Mr Bode's discovery that Meyer had seen the Georgium Sidus in 1756, perfectly agreed with the theory of its motions which he (De la Place) had deduced from his own doctrines. Any well informed mathematician will see, that De la Place's data afforded no such precision; and the book on the Elliptical Motions of the Planets, to which he alludes, contains no grounds for his inference. This observation we owe to the author of a paper on that subject in the Transactions of the Royal Society of Edinburgh. We hope that our readers will excuse this occasional observation, by which we wish to do justice to the merit of a modest man, and one of the greatest philosophers of his time. Our only claim in the present dissertation is the making his excellent performance on the tides accessible to an English reader not much versant in mathematical researches; and we are sorry that our limits do not admit any thing more than a sketch of it. But to proceed.

Assuming 2 : 5 as the ratio of SC to CM, we have the angle CMS = 23° 34' nearly, and $m'o'b' = 11° 47'$; and this is the greatest difference between the moon's place and the place of high water. And when this obtains, the moon's elongation $m'o's$ is 56° 47' from the nearest syzygy. Hence it follows, that while the moon moves uniformly from 56° 47' west elongation to 56° 47' east, or from 123° 13' east to 123° 13' west, the tide day is shorter than the lunar day; and while she moves from 56° 47' east to 123° 13', or from 123° 13' west to 56° 47', the tide-day is longer than the lunar-day.

Vol. XVIII. Part II.

We now see the reason why

The swelling tides obey the moon.

The time of high water, when the sun and moon are in the equator, is never more than 47 minutes different from that of the moon's southing (+ or — a certain fixed quantity, to be determined once for all by observation.)

It is now an easy matter to determine the hour of high water corresponding to any position of the sun and moon in the equator. Suppose that on the noon of a certain day the moon's distance from the sun is $m s$. The construction of this problem gives us $s b$, and the length of the tide day. Call this T . Then say $360' : s m = T : t$, and t is the hour of high water.

Or, if we choose to refer the time of high water to the moon's southing, we must find the value of $m b$ at the time of the moon's southing, and the difference d between the tide day and a mean lunar day L , and say $360' : m b = d : t$, the time of high water before the moon's southing in the first and third quarters, but after it in the second and fourth. The following table by Daniel Bernoulli exhibits these times for every 10th degree of the moon's elongation from the sun or from the point of opposition. The second column is the minutes of time between the moon's southing and the place of high water. The marks — and + distinguish whether the high water is before or after the moon's southing. The third column is the hour and minute of high water. But we must remark, that the first column exhibits the elongation, not on the noon of any day, but at the very time of high water. The two remaining columns express the heights of the tides and their daily variations.

The height of high water above the low water constitutes what is usually called the tide. This is the interesting circumstance in practice. Many circumstances render it almost impossible to say what is the elevation of high water above the natural surface of the ocean. In many places the surface at low water is above the natural surface of the ocean. This is the case in rivers at a great distance from their

Tide. their mouths. This may appear absurd, and is certainly very paradoxical; but it is a fact established on the most unexceptionable authority. One instance fell under our own observation. The low water mark at spring tide in the harbour of Alloa was found by accurate levelling to be three feet higher than the top of the stone pier at Leith, which is several feet above the high water mark of this harbour. A little attention to the motion of running waters will explain this completely. Whatever checks the motion of water in a canal must raise its surface. Water in a canal runs only in consequence of the declivity of this surface: (See RIVER). Therefore a flood tide coming to the mouth of a river checks the current of its waters, and they accumulate at the mouth. This checks the current farther up, and therefore the waters accumulate there also; and this checking of the stream, and consequent rising of the waters, is gradually communicated up the river to a great distance. The water rises everywhere, though its surface still has a slope. In the mean time, the flood tide at the mouth passes by, and an ebb succeeds. This must accelerate even the ordinary course of the river. It will more remarkably accelerate the river now raised above its ordinary level, because the declivity at the mouth will be so much greater. Therefore the waters near the mouth, by accelerating, will sink in their channel, and increase the declivity of the canal beyond them. This will accelerate the waters beyond them; and thus a stream more rapid than ordinary will be produced along the whole river, and the waters will sink below their ordinary level. Thus there will be an ebb below the ordinary surface as well as a flood above it, however sloping that surface may be.

Hence it follows, that we cannot tell what is the natural surface of the ocean by any observations made in a river, even though near its mouth. Yet even in rivers we have regular tides, subjected to all the varieties deduced from this theory.

We have seen that the tide is always proportional to MS. It is greatest therefore when the moon is in conjunction or opposition, being then Ss , the sum of the separate tides produced by the sun and moon. It gradually decreases as the moon approaches to quadrature; and when she is at Q or q , it is SO , or the difference of the separate tides. Supposing Ss divided into 1000 equal parts, the length of MS is expressed in these parts in the fourth column of the foregoing table, and their differences are expressed in the fifth column.

We may here observe, that the variations of the tides in equal small times are proportional to the sine of twice the distance of the place or high water from the moon. For since Mn is a constant quantity, on the supposition of the moon's uniform motion, Mv is proportional to the variation of MS . Now $Mn : Mv = MC : CI = 1 : \sin. 2y$, and Mn and MC are constant quantities.

Thus we have seen with what ease the geometrical construction of this problem not only explains all the interesting circumstances of the tides, but also points them out, almost without employing the judgment, and exhibits to the eye the gradual progress of each phenomenon. In these respects it has great advantages over the very elegant algebraic analysis of Mr Bernoulli. In that process we advance almost without ideas, and obtain our solutions as detached facts, without perceiving their regular series. This is the usual pre-eminence of geometrical analysis; and we regret that Mr Bernoulli, who was eminent in this branch, did not rather employ it. We doubt not but that he would have shown still more clearly the connection and gradual progress of every particular. His aim, however, being to instruct those who were to calculate tables of the different affections

of the tides, he adhered to the algebraic method. Unfortunately it did not present him with the easiest formulæ for practice. But the geometrical construction which we have given suggests several formulæ which are exceedingly simple, and afford a very ready mode of calculation.

The fundamental problems are to determine the angle sOb or mOb , having mOs given; and to determine MS .

Let the given angle mOs be called a ; and, to avoid the ambiguity of algebraic signs, let it always be reckoned from the nearest syzygy, so that we may always have a equal to the sum of x and y . Also make $d^2 = \frac{S^2 \times \sin.^2 2a}{M^2 + S^2 + 2M \times S \times \cos. 2a}$, which represents the $\frac{S^2}{M^2}$

of fig. 4. or $\sin.^2 2y$, and make $p = \frac{S \times \sin. 2a}{M + S \times \cos. 2a}$, which

is the expression of $\frac{Sc}{Mc}$ of that figure, or of $\tan. 2y$. Then we shall have,

1. $\sin. y = \sqrt{\frac{1 - \sqrt{1 - d^2}}{2}}$. For we shall have $\cos.$

$2y = \sqrt{1 - d^2}$. But $\sin.^2 y = \frac{1}{2} - \frac{1}{2} \cos. 2y = \frac{1 - \sqrt{1 - d^2}}{2}$,

and $\sin. y = \sqrt{\frac{1 - \sqrt{1 - d^2}}{2}}$.

2. $\tan. y = \frac{p}{1 + \sqrt{1 + p^2}}$. For because p is $= \tan. 2y$, $\sqrt{1 + p^2}$ is the secant of $2y$, and $1 + \sqrt{1 + p^2} : 1 = p : \tan. y$.

These processes for obtaining y directly are abundantly simple. But it will be much more expeditious and easy to content ourselves with obtaining $2y$ by means of the value of its tangent, viz. $\frac{S \cdot \sin. 2a}{M + S \cdot \cos. 2a}$. Or, we may find x by

means of the similar value of its tangent $\frac{Md}{Sd}$ of fig. 4.

There is still an easier method of finding both $2x$ and $2y$, as follows.

Make $M + S : M - S = \tan. a : \tan. b$. Then b is the difference of x and y , as a is their sum. For this analogy evidently gives the tangent of half the difference of the angles CSM and CMS of fig. 4. or of $2x$ and $2y$. Therefore to a , which is half the sum of $2x + 2y$, add b , and we have $2x = a + b$, or $x = \frac{a + b}{2}$, and $y = \frac{a - b}{2}$.

By either of these methods a table may be readily computed of the value of x or y for every value of a .

But we must recollect that the values of S and M are by no means constant, but vary in the inverse triplicate ratio of the earth's distance from the sun and moon; and the ratio of 2 to 5 obtains only when these luminaries are at their mean distances from the earth. The forces corresponding to the perigeon medium and apogean distances are as follows.

		Sun.	Moon.
Apogean	- -	1,901	4,258
Medium	- -	2,	5,
Perigeon	- -	2,105	5,925

Hence we see that the ratio of S to M may vary from 1,901 : 5,925 to 2,105 : 4,258, that is, nearly from 1 : 3 to 1 : 2, or from 2 : 6 to 2 : 4. The solar force does not vary much, and may be retained as constant without any great error. But the change of the moon's force has great effects on the tides both as to their time and their quantity.

I. In respect of their Time.

1. The tide day following a spring tide is 24h. 27' when the moon is in perigee, but 24h. 33' when she is in apogee.
2. The tide day following neap tide is 25h. 15', and 25h. 40' in these two situations of the moon.
3. The greatest interval of time between high water and the moon's southing is 39' and 61'; the angle γ being $9^\circ 45'$ in the first case, and $15^\circ 15'$ in the second.

II. In respect of their Heights.

1. If the moon is in perigee when new or full, the spring tide will be 8 feet instead of 7, which corresponds to her mean distance. The very next spring tide happens when she is near her apogee, and will be 6 feet instead of 7. The neap tides happen when she is at her mean distance, and will therefore be 3 feet.

But if the moon be at her mean distance when new or full, the two succeeding spring tides will be regular or 7 feet, and one of the neap tides will be 4 feet and the other only 2 feet.

Mr Bernoulli has given us the following table of the time of high water for these three chief situations of the moon, namely, her perigee, mean distance, and apogee. It may be had by interpolation for all intermediate positions with as great accuracy as can be hoped for in phenomena which are subject to such a complication of disturbances. The first column contains the moon's elongation from the sun. The columns P, M, A, contain the minutes of time which elapse between the moon's southing and high water, according as she is in perigee, at her mean distance, or in apogee. The sign — indicates the priority, and + the posteriority, of high water to the moon's southing.

The reader will undoubtedly be making some comparison in his own mind of the deductions from this theory with the actual state of things. He will find some considerable resemblances; but he will also find such great differences as will make him very doubtful of its justness. In very few places does the high water happen within $\frac{3}{4}$ ths of an hour

of the moon's southing, as the theory leads him to expect; and in no place whatever does the spring tide fall on the day of new and full moon, nor the neap tide on the day of her quadrature. These always happen two or three days later. By comparing the difference of high water and the moon's southing in different places, he will hardly find any connecting principle. This shows evidently that the cause of this irregularity is local, and that the justness of the theory is not affected by it. By considering the phenomena in a navigable river, he will learn the real cause of the deviation. A flood tide arrives at the mouth of a river. The true theoretical tide differs in no respect from a wave. Suppose a spring tide actually formed on a fluid sphere, and the sun and moon then annihilated. The elevation must sink, pressing the under waters aside, and causing them to rise where they were depressed. The motion will not stop when the surface comes to a level; for the waters arrived at that position with a motion continually accelerated. They will therefore pass this position as a pendulum passes the perpendicular, and will rise as far on the other side, forming a high water where it was low water, and a low water where it was high water; and this would go on for ever, oscillating in a time which mathematicians can determine, if it were not for the viscosity, or something like friction, of the waters. If the sphere is not fluid to the centre, the motion of this wave will be different. The elevated waters cannot sink without diffusing themselves sidewise, and occasioning a great horizontal motion, in order to fill up the hollow at the place of low water. This motion will be greatest about half way between the places of high and low water. The shallower we suppose the ocean the greater must this horizontal motion be. The resistance of the bottom (tho' perfectly smooth and even) will greatly retard it all the way to the surface. Still, however, it will move till all be level, and will even move a little farther, and produce a small flood and ebb where the ebb and flood had been. Then a contrary motion will obtain; and after a few oscillations, which can be calculated, it will be insensible. If the bottom of the ocean (which we still suppose to cover the whole earth) be uneven, with long extended valleys running in various directions, and with elevations reaching near the surface, it is evident that this must occasion great irregularities in the motion of the undermost waters, both in respect of velocity and direction, and even occasion small inequalities on the surface, as we see in a river with a rugged bottom and rapid current. The deviations of the under currents will drag with them the contiguous incumbent waters, and thus occasion greater superficial irregularities.

Now a flood arriving at the mouth of a river, must act precisely as this great wave does. It must be propagated up the river (or along it, even though perfectly level) in a certain time, and we shall have high water at all the different places in succession. This is distinctly seen in all rivers. It is high water at the mouth of the Thames at three o'clock, and later as we go up the river, till at London bridge we have not high water till three o'clock in the morning, at which time it is again high water at the Nore. But, in the mean time, there has been low water at the Nore, and high water about half way to London; and while the high water is proceeding to London, it is ebbing at this intermediate place, and is low water there when it is high water at London and at the Nore. Did the tide extend as far beyond London as London is from the Nore, we should have three high waters with two low waters interposed. The most remarkable instance of this kind is the Maragnon or Amazon river in South America. It appears by the observations of Condomine and others, that between Para, at the mouth of the river, and the conflux of the Ma-

dera and Maragnon, there are seven coexistent high waters, with six low waters between them. Nothing can more evidently show that the tides in these places are nothing but the propagation of a wave. The velocity of its superficial motion, and the distance to which it will sensibly go, must depend on many circumstances. A deep channel and gentle acclivity will allow it to proceed much farther up the river, and the distance between the successive summits will be greater than when the channel is shallow and steep. If we apply the ingenious theory of Chevalier Buat, delivered in the article RIVER, we may tell both the velocity of the motion and the interval of the successive high waters. It may be imitated in artificial canals, and experiments of this kind would be very instructive. We have said enough at present for our purpose of explaining the irregularity of the times of high water in different places, with respect to the moon's southing. For we now see clearly, that something of the same kind must happen in all great arms of the sea which are of an oblong shape, and communicate by one end with the open ocean. The general tide in this ocean must proceed along this channel, and the high water will happen on its shores in succession. This also is distinctly seen. The tide in the Atlantic ocean produces high water at new and full moon at a later and later hour along the south coast of Great Britain in proportion as we proceed from Scilly islands to Dover. In the same manner it is later and later as we come along the east coast from Orkney to Dover. Yet even in this progress there are considerable irregularities, owing to the sinuosities of the shores, deep indented bays, prominent capes, and extensive ridges and valleys in the channel. A similar progress is observed along the coasts of Spain and France, the tide advancing gradually from the south, turning round Cape Finisterre, ranging along the north coast of Spain, and along the west and north coasts of France.

The attentive consideration of these facts will not only satisfy us with respect to this difficulty, but will enable us to trace a principle of connection amidst all the irregularities that we observe.

We now add, that if we note the difference between the time of high water of spring tide, as given by theory, for any place, and the *observed time* of high water, we shall find this interval to be very nearly constant thro' the whole series of tides during a lunation. Suppose this interval to be forty hours. We shall find every other phenomenon succeed after the same interval. And if we suppose the moon to be in the place where she was 40 hours before, the observation will agree pretty well with the theory, as to the succession of tides, the length of tide day, the retardations of the tides, and their gradual diminution from spring to neap tide. We say pretty well; for there still remain several small irregularities, different in different places, and not following any observable law. These are therefore local, and owing to local causes. Some of these we shall afterwards point out. There is also a general deviation of the theory from the real series of tides. The neap tides, and those adjoining, happen a little earlier than the corrected theory points out. Thus at Bristol (where more numerous and accurate observations have been made than at any other place in Europe), when the moon changes precisely at noon, it is high water at 1 h. 26'. When the moon enters her second quarter at noon, it is high water at 8 h. 40', instead of 9 h. 48', which theory affigns.

Something similar, and within a very few minutes equal, to this is observed in every place on the sea-coast. This is therefore something general, and indicates a real defect in the theory.

But this arises from the same cause with the other general deviation, viz. that the greatest and least tides do not happen

on the days of full and half moon, but a certain time after. We shall attempt to explain this.

We set out with the supposition, that the water acquired in an instant the elevation competent to its equilibrium. But this is not true. No motion is instantaneous, however great the force; and every motion and change of motion produced by a sensible or finite force increases from nothing to a sensible quantity by infinitely small degrees. Time elapses before the body can acquire any sensible velocity; and in order to acquire the same sensible velocity by the action of different forces acting similarly, a time must elapse inversely proportional to the force. An infinitely small force requires a finite time for communicating even an infinitely small velocity; and a finite force, in an infinitely small time, communicates only an infinitely small velocity; and if there be any kind of motion which changes by insensible degrees, it requires a finite force to prevent this change. Thus a bucket of water, hanging by a cord lapped round a light and easily moveable cylinder, will run down with a motion uniformly accelerated; but this motion will be prevented by hanging an equal bucket on the other side, so as to act with a finite force. This force prevents only infinitely small accelerations.

Now let ALKF (fig. 6.) be the solid nucleus of the earth, surrounded by the spherical ocean $bhdg$. Let this be raised to a spheroid BHOG by the action of the moon at M, or in the direction of the axis CM. If all be at rest, this spheroid may have the form precisely competent to its equilibrium. But let the nucleus, with its spheroidal ocean, have a motion round C in the direction AFKL from west to east. When the line of water BA is carried into the situation sq infinitely near to BA, it is no longer in equilibrium; for s is too elevated, and the part now come to B is too much depressed. There is a force tending to depress the waters at s , and to raise those now at B; but this force is infinitely small. It cannot therefore restore the shape competent to equilibrium till a sensible time has elapsed; therefore the disturbing force of the moon cannot keep the summit of the ocean in the line MC. The force must be of a certain determinate magnitude before it can in an instant undo the instantaneous effect of the rotation of the waters and keep the summit of the ocean in the same place. But this effect is possible; for the depression at s necessary for this purpose is nearly as the distance from B, being a depression, not from a straight line, but from a circle described with the radius CB. It is therefore an infinitesimal of the first order, and may be restored in an instant, or the continuation of the depression prevented by a certain finite force. Therefore there is some distance, such as By, where the disturbing force of the moon may have the necessary intensity. Therefore the spherical ocean, instead of being kept continually accumulated at B and D, as the waters turn round, will be kept accumulated at y and y' , but at a height somewhat smaller. It is much in this way that we keep melted pitch or other clammy matter from running off from a brush, by continually turning it round, and it hangs protuberant, not from the lowest point, but from a point beyond it, in the direction of its motion. The facts are very similar. The following experiment will illustrate this completely, and is quite a parallel fact. Conceive GDH, the lower half of the ellipse, to be a supple heavy rope or chain hanging from a roller with a handle. The weight of the rope makes it hang in an oblong curve, just as the force of the moon raises the waters of the ocean. Turn the roller very slowly, and the rope, unwinding at one side and winding up on the other side of the roller, will continue to form the same curve; but turn the roller very briskly in the direction FKL, and the rope will now hang like the curve $uy'v$, considerably advanced

advanced from the perpendicular, so far, to wit, that the force of gravity may be able in an instant to undo the infinitely small elevation produced by the turning.

We are very anxious to have this circumstance clearly conceived, and its truth firmly established; because we have observed it to puzzle many persons not unaccustomed to such discussions: we therefore hope that our readers, who have got over the difficulty, will indulge us while we give yet another view of this matter, which leads to the same conclusion.

It is certain that the interval between high and low water is not sufficient for producing all the accumulation necessary for equilibrium in an ocean so very shallow. The horizontal motion necessary for gathering together so much water along a shallow sea would be prodigious. Therefore it never attains its full height; and when the waters, already raised to a certain degree, have passed the situation immediately under the moon, they are still under the action of accumulating forces, although these forces are now diminished. They will continue rising, till they have so far past the moon that their situation subjects them to depressing forces. If they have acquired this situation with an accelerated motion, they will rise still farther by their inherent motion, till the depressing forces have destroyed all their acceleration, and then they will begin to sink again. It is in this way that the nutation of the earth's axis produces the greatest inclination, not when the inclining forces are greatest, but three months after. It is thus that the warmest time of the day is a considerable while after noon, and that the warmest season is considerably after midsummer. The warmth increases till the momentary waste of heat exceeds the momentary supply. We conclude by saying, that it may be demonstrated, that, in a sphere fluid to the centre, the time of high water cannot be less, and may be more, than three lunar hours after the moon's southing. As the depth of the ocean diminishes, this interval also diminishes.

It is perhaps impossible to assign the distance *By* at which the summit of the ocean may be kept while the earth turns round its axis. We can only see, that it must be less when the accumulating force is greater, and therefore less in spring tides than in neap tides; but the difference may be insensible. All this depends on circumstances which we are little acquainted with: many of these circumstances are local; and the situation of the summit of the ocean, with respect to the moon, may be different in different places.

Nor have we been able to determine theoretically what will be the height of the summit. It will certainly be less than the height necessary for perfect equilibrium. Daniel Bernoulli says, that, after very attentive consideration, he is convinced that the height at new or full moon will be to the theoretical height as the cosine of the angle *BCy* to radius,

$$\text{or that the height at } y \text{ will be } Bb \times \frac{Cz}{Cb}$$

The result of all this reasoning is, that we must always suppose the summit of the tide is at a certain distance eastward from the place assigned by the theory. Mr Bernoulli concludes, from a very copious comparison of observations at different places, that the place of high water is about 20 degrees to the eastward of the place assigned by the theory. Therefore the table formerly given will correspond with observation, if the leading column of the moon's elongation from the sun be altered accordingly. We have inserted it again in this place, with this alteration, and added three columns for the times of high water. Thus changed it will be of great use.

We have now an explanation of the acceleration of the neap tides, which should happen 6 hours later than the

spring tides. They are in fact tides corresponding to positions of the moon, which are 20° more, and not the real spring and neap tides. These do not happen till two days after; and if the really greatest and least tides be observed, the least will be found 6 hours later than the first.

Elong. of Moon.	High Water before or after Moon's Southing.			Time of High Water.

180	18	22	27½	0.18	0.22	0.27

This table is general; and exhibits the time of high water, and their difference from those of the moon's southing, in the open sea, free from all local obstructions. If therefore the time of high water in any place on the earth's equator (for we have hitherto considered no other) be different from this table (supposed correct), we must attribute the difference to the distinguishing circumstances of the situation. Thus every place on the equator should have high water on the day that the moon, situated at her mean distance, changes precisely at noon, at 22 minutes past noon; because the moon passes the meridian along with the sun by supposition. Therefore, to make use of this table, we must take the difference between the first number of the column, intitled time of high water, from the time of high water at full and change peculiar to any place, and add this to all the other numbers of that column. This adapts the table to the given place. Thus, to know the time of high water at Leith when the moon is 50° east of the sun, at her mean distance from the earth, take 27 from 4h. 30, there remains 4.08. Add this to 2h. 48', and we have 6h. 56' for the hour of high water. (The hour of high water at new and full moon for Edinburgh is marked 4h. 30' in Maske's tables, but we do not pretend to give it as the exact determination. This would require a series of accurate observations.)

It is by no means an easy matter to ascertain the time of high water with precision. It changes so very slowly, that we may easily mistake the exact minute. The best method is to have a pipe with a small hole near its bottom, and a float with a long graduated rod. The water gets in by the small hole and raises the float, and the smallness of the hole prevents the sudden and irregular starts which waves would occasion. Instead of observing the moment of high water, observe the height of the rod about half an hour before, and wait after high water till the rod comes again to that height: take the middle between them. The water rises sensibly

T. 10. sensibly half an hour before the top of the tide, and quickly changes the height of the rod, so that we cannot make a great mistake in the time.

Mr Bernoulli has made a very careful comparison of the theory thus corrected, with the great collection of observations preserved in the *Dépot de la Marine* at Brest and Rochefort; and finds the coincidence very great, and far exceeding any rule which he had ever seen. Indeed we have no rules but what are purely empirical, or which suppose a uniform progression of the tides.

* See Mr Cassini, *Mém. Acad. Paris*, 1734.

The heights of the tides are much more affected by local circumstances than the regular series of their times. The regular spring tide should be to the neap tide in the same proportion in all places; but nothing is more different than this proportion. In some places the spring tide is not double of the neap tide, and in other places it is more than quadruple. This prevented Bernoulli from attempting to fix the proportion of M to S by means of the heights of the tides. Newton had, however, done it by the tides at Bristol, and made the lunar force almost five times greater than the solar force. But this was very ill-founded, for the reason now given.

Yet Bernoulli saw, that in all places the tides gradually decreased from the syzgies to the quadratures. He therefore presumed, that they decreased by a similar law with the theoretical tides, and has given a very ingenious method of accommodating the theory to any tides which may be observed. Let A be the spring tide, and B the neap tide in any place. Then form an M and an S from these, by

$$\text{making } M = \frac{A+B}{2}, \text{ and } S = \frac{A-B}{2}; \text{ so that } M + S \text{ may}$$

be = A, and M - S = B agreeable to theory. Then with this M and S compose the general tide T, agreeable to the construction of the problem. We may be persuaded that the result cannot be far from the truth. The following table is calculated for the three chief distances of the moon from the earth.

Elong. $\text{D} \& \text{C}$	Height of the Tide.		
	Moon in Perigee.	Moon in M. Dist.	Moon in Apogee.
0	0,99A + 0,15B	0,88A + 0,12B	0,79A + 0,08B
10	1,10A + 0,04B	0,97A + 0,03B	0,87A + 0,02B
20	1,14A + 0,00B	1,00A + 0,00B	0,90A + 0,00B
30	1,10A + 0,04B	0,97A + 0,03B	0,87A + 0,02B
40	0,99A + 0,15B	0,88A + 0,12B	0,79A + 0,08B
50	0,85A + 0,32B	0,75A + 0,25B	0,68A + 0,18B
60	0,67A + 0,53B	0,59A + 0,41B	0,53A + 0,29B
70	0,46A + 0,75B	0,41A + 0,59B	0,37A + 0,41B
80	0,28A + 0,96B	0,25A + 0,75B	0,23A + 0,53B
90	0,13A + 1,13B	0,12A + 0,88B	0,11A + 0,62B
100	0,03A + 1,24B	0,03A + 0,97B	0,03A + 0,68B
110	0,00A + 1,28B	0,00A + 1,00B	0,00A + 0,70B
120	0,03A + 1,24B	0,03A + 0,97B	0,03A + 0,68B
130	0,13A + 1,13B	0,12A + 0,88B	0,11A + 0,62B
140	0,28A + 0,96B	0,25A + 0,75B	0,23A + 0,53B
150	0,46A + 0,75B	0,41A + 0,59B	0,37A + 0,41B
160	0,67A + 0,53B	0,59A + 0,41B	0,53A + 0,29B
170	0,85A + 0,32B	0,75A + 0,25B	0,68A + 0,18B
180	0,99A + 0,15B	0,88A + 0,12B	0,79A + 0,08B

Observe that this table is corrected for the retardation arising from the inertia of the waters. Thus when the moon is 20 degrees from the sun, the mean distance tide is 1,00A + 0,00B, which is the theoretical tide corresponding to conjunction or opposition.

We have now given in sufficient detail the phenomena of the tides along the equator, when the sun and moon are both in the equator, shewing both their times and their magnitude. When we recollect that all the sections of an oblong spheroid by a plane passing through an equatorial diameter are ellipses, and that the compound tide is a combination of two such spheroids, we perceive that every section of it through the centre, and perpendicular to the plane in which the sun and moon are situated, is also an ellipse, whose shorter axis is the equatorial diameter of a spring tide. This is the greatest depression in all situations of the luminaries; and the points of greatest depression are the lower poles of every compound tide. When the luminaries are in the equator, these lower poles coincide with the poles of the earth. The equator, therefore, of every compound tide is also an ellipse; the whole circumference of which is lower than any other section of this tide, and gives the place of low water in every part of the earth. In like manner, the section through the four poles, upper and lower, gives the place of high water. These two sections are terrestrial meridians or hour circles, when the luminaries are in the equator.

Hence it follows, that all that we have already said as to the times of high and low water may be applied to every place on the surface of the earth, when the sun and moon are in the equator. But the heights of tide will diminish as we recede from the equator. The heights must be reduced in the proportion of radius to the cosine of the latitude of the place. But in every other situation of the sun and moon all the circumstances vary exceedingly. It is very true, that the determination of the elevation of the waters in any place whatever is equally easy. The difficulty is, to exhibit for that place a connected view of the whole tide, with the hours of flood and ebb, and the difference between high and low water. This is not indeed difficult; but the process by the ordinary rules of spherical trigonometry is tedious. When the sun and moon are not near conjunction or opposition, the shape of the ocean resembles a turnip, which is flat and not round in its broadest part. Before we can determine with precision the different phenomena in connection, we must ascertain the position or attitude of this turnip; marking on the surface of the earth both its elliptical equators. One of these is the plane passing thro' the sun and moon, and the other is perpendicular to it, and marks the place of low water. And we must mark in like manner its first meridian, which passes through all the four poles, and marks on the surface of the earth the place of high water. The position of the greatest section of this compound spheroid is frequently much inclined to the earth's equator; nay, sometimes is at right angles to it, when the moon has the same right ascension with the sun, but a different declination. In these cases the ebb tide on the equator is the greatest possible; for the lower poles of the compound spheroid are in the equator. Such situations occasion a very complicated calculus. We must therefore content ourselves with a good approximation.

And first, with respect to the times of high water. It will be sufficient to conceive the sun and moon as always in one plane, viz. the ecliptic. The orbits of the sun and moon are never more inclined than 5½ degrees. This will make very little difference; for when the luminaries are so situated that the great circle through them is much inclined to the equator, they are then very near to each other, and the form of the spheroid is little different from what it would be if they were really in conjunction or opposition. It will therefore be sufficient to consider the moon in three different situations.

1. In the equator. The point of highest water is never farther

ther from the moon than 15° , when she is in apogee and the sun in perigee. Therefore if a meridian be drawn thro' the point of highest water to the equator, the arch mb of fig. 4. will be represented on the equator by another arch about $\frac{2}{3}$ of this by reason of the inclination of the equator and ecliptic. Therefore, to have the time of high water, multiply the numbers of the columns which express the difference of high water and the moon's southing by $\frac{2}{3}$, and the products give the real difference.

2. Let the moon be in her greatest declination. The arch of right ascension corresponding to mb will be had by multiplying mb , or the time corresponding to it in the table, by $\frac{1}{9}$.

3. When the moon is in a middle situation between these two extremes, the numbers of the table will give the right ascension corresponding to mb without any correction, the distance from the equator compensating for the obliquity of the ecliptic arch mb .

The time of low water is not so easily found; and we must either go through the whole trigonometrical process, or content ourselves with a less perfect approximation. The trigonometrical process is not indeed difficult: We must find the position of the plane through the sun and moon. A great circle through the moon perpendicular to this is the line of high water; and another perpendicular circle cutting this at right angles is the circle of low water.

But it will be abundantly exact to consider the tide as accompanying the moon only.

Let $NQSE$ (fig. 7.) be a section of the terraqueous globe, of which N and S are the north and south poles and EOQ the equator. Let the moon be in the direction OM , having the declination BQ . Let D be any place on the earth's surface. Draw the parallel LDC of latitude. Let $B'Fb'f$ be the ocean, formed into a spheroid, of which Bb is the axis and fF the equator.

As the place D is carried along the parallel CDL by the rotation of the earth, it will pass in succession through different depths of the watery spheroid. It will have high water when at C and L , and low water when it crosses the circle fOF . Draw the meridian NdG , and the great circle Edb . The arch GQ , when converted into lunar hours (each about 62 minutes), gives the duration of the flood dc and of the subsequent ebb cd , which happen while the moon is above the horizon; and the arch EG will give the durations of the flood and of the ebb which happen when the moon is below the horizon. It is evident, that these two floods and two ebbs have unequal durations. When D is at C it has high water; and the height of the tide is CC' . For the spheroid is supposed to touch the sphere on the equator fOF , so that CC' is the difference between high and low water. At L the height of the tide is LL' ; and if we describe the circle LNq , $C'q$ is the difference of these high waters, or of these tides.

Hence it appears, that the two tides of one lunar day may be considerably different, and it is proper to distinguish them by different names. We shall call that a *superior tide* which happens when the moon is above the horizon during high water. The other may be called the *inferior tide*. The duration of the superior tide is measured by $2GQ$, and that of the inferior tide by $2EG$, and $4GO$ measures the difference between the whole duration of a superior and of an inferior tide.

From this construction we may learn in general, 1. When the moon has no declination, the durations and also the heights of the superior and inferior tides are equal in all parts of the world. For in this case the tide equator fF coincides with the meridian NOS , and the poles Bb' of the watery spheroid are on the earth's equator.

2. When the moon has declination, the duration and also the height of a superior tide at any place is greater than that of the inferior; or is less than it, according as the moon's declination and the latitude of the place are of the same or opposite names.

This is an important circumstance. It frequently happens that the inferior tide is found the greatest when it should be the least; which is particularly the case at the Nore. This shows, without further reasoning, that the tide at the Nore is only a branch of the regular tide. The regular tide comes in between Scotland and the continent; and after travelling along the coast reaches the Thames, while the regular tide is just coming in again between Scotland and the continent.

3. If the moon's declination is equal to the co-latitude of the place, or exceeds it, there will be only one tide in a lunar day. It will be a superior or an inferior tide, according as the declination of the moon and the latitude of the place are of the same or opposite kinds. For the equator of the tide cuts the meridian in f and F . Therefore a place which moves in the parallel cf has high water when at c , and 12 lunar hours afterwards, has low water when at f . And any place k which is still nearer to the pole N has high water when at k , and 12 lunar hours afterwards has low water at m . Therefore, as the moon's declination extends to 30° , all places farther north or south than the latitude 60° will sometimes have only one tide in a lunar day.

4. The sine of the arch GO , which measures $\frac{1}{2}$ th of the difference between the duration of a superior and inferior tide, is $= \tan. \text{lat.} \times \tan. \text{decl.}$ For in the spherical triangle dOG

Rad : cotan. $dOG = \tan. dG : \sin. GO$, and

Sin. $GO = \tan. dOQ \times \tan. dG = \tan. \text{decl.} \times \tan. \text{lat.}$

Hence we see, that the difference of the durations of the superior and inferior tides of the same day increase both with the moon's declination and with the latitude of the place.

The different situations of the moon and of the place of observation affect the heights of the tides no less remarkably. When the point D comes under the meridian NBQ in which the moon is situated, there is a superior high water, and the height of the tide above the low water of that day is CC' . When D is at L , the height of the inferior tide is LL' . The elevation above the inscribed sphere is $M \times \cos. z y$, z being the zenith distance of the moon at the place of observation. Therefore at high water, which by the theory is in the place directly under the moon, the height of the tide is as the square of the cosine of the moon's zenith or nadir distance.

Hence we derive a construction which solves all questions relating to the height of the tides with great facility, free from all the intricacy and ambiguities of the algebraic analysis employed by Bernoulli.

With the radius $CQ = M$ (the elevation produced by the moon above the inscribed sphere) describe the circle $pQPE$ (fig. 8.) to represent a meridian, of which P and p are the poles, and EQ the equator. Lift CP in O ; and round O describe the circle $PBCD$. Let M be the place over which the moon is vertical, and Z be the place of observation. MQ is the moon's declination, and ZQ is the latitude of the place. Draw MCm , ZCN , cutting the small circle in A and B . Draw AGI perpendicular to Cp , and draw CIj , which will cut off an arch $E \mu = QM$. $M\mu$ and μN are the moon's zenith and nadir distances. Draw the diameter BD , and the perpendiculars IK , Gj , and AF . Also draw OA , PA , AB , ID .

Then DF is the superior tide, DK is the inferior tide, and Dj is the arithmetical mean tide.

Tide.

For the angles BCA, BDA, standing on BA, are equal. Also the angles LDB, & CN, are equal, being supplements of the angle ICB. Therefore, if BD be made radius, DA and DI are the sines of the zenith and nadir distances of the moon.

But $BD : DA = DA : DF$. Therefore $DF = M \times \text{cof.}^2 \phi$, = the height Z z of the superior tide. Also $DK = M \cdot \text{cof.}^2 \phi'$, = the height n n' of the inferior tide.

Also, because IA is bisected in G, KF is bisected in H, and $DH = \frac{DK + DF}{2}$, = the medium tide.

Let us trace the relation of the consequences of the various positions of Z and M, as we formerly considered the results of the various situations of the sun and moon.

First, then, let Z retain its place, and let M gradually approach it from the equator. When M is in the equator, A and I coincide with C, and the three points F, K, and H, coincide in i.

As M approaches to Z, A and I approach to B and D; DF increases, and DK diminishes. The superior or inferior tide is greatest when the moon is in M or in N; and DF is then = M. As the moon passes to the northward of the place, the superior and inferior tides both diminish till I comes to D; at which time MQ is equal to ZP, and there is no inferior tide. This however cannot happen if z P is greater than 30°, because the moon never goes farther from the equator. M still going north, we have again a perpendicular from I on BD, but below I, indicating that the inferior tide, now measured by DK, belongs to the hemisphere next the moon. Also, as M advances from the equator northward, DH diminishes continually. First, while H lies between O and B, because G approaches O; and afterwards, when G is above O and H lies between O and D. It is otherwise, however, if ZQ is greater than 45°; for then DB is inclined to EQ the other way, and DH increases as the point G rises.

In the next place, let M retain its position, and Z proceed along the meridian.

Let us begin at the equator, or suppose Q the place of observation. ED then coincides with CP, and the three lines DF, DK, and DH, all coincide with PG, denoting the two equal tides Q q and E e and their medium, equal to either. As Z goes northward from Q, BOD detaches itself from COP; the line DF increases, while DK and DH diminish. When Z has come to M, F and B coincide with A, and DK and DH are still more diminished. When Z passes M, all the three lines DF, DK, and DH, continue to diminish. When Z comes to latitude 45°, DB is parallel to IA and EQ, and the point H coincides with O. This situation of Z has the peculiar property that DH (now DO) is the same, whatever be the declination of the moon. For IA being always parallel to DB, OK and OF will be equal, and DO will be half of DK and DF however they may vary. When Z gets so far north that ZP is = MQ, the diameter bd falls on I; so that dk vanishes, and we have only df. And when Z goes still farther north, dk appears on the other side of I. When Z arrives at the pole, BD again coincides with PC, D with C, and DF, DK, and DH, coincide with CG.

These variations of the points F, K, and H, indicate the following phenomena.

1. The greatest tides happen when the moon is in the zenith or nadir of the place of observation: 'or then the point B coincides with A, and DF becomes DB; that is, = M, indicating the full tide BB'.

2. When the moon is in the equator, the superior and inferior tides have equal heights, = $M \cdot \text{cof.}^2 \text{ lat.}$ For then

A and I coincide with C, and the points F and K coincide in i, and $Di = DB \cdot \text{cof.}^2 \text{ BDC,} = M \cdot \text{cof.}^2 \text{ lat.}$

3. If the place of observation is in the equator, the inferior and superior tides are again equal, whatever is the moon's declination: For then B coincides with C, and the points F, K, and H, coincide with G; and $PG = PC \cdot \text{cof.}^2 \text{ APG,} = M \cdot \text{cof.}^2 \text{ decl. moon.}$

4. The superior tides are greater or less than the inferior tides according as the latitude and declination are of the same or of opposite names. For by making $Q = QZ$, and drawing Scn , cutting the small circle in s, we see that the figure is reversed. The difference between the superior and inferior tides is KF, or $IA \times \text{cosin. of the angle formed by IA and DB;}$ that is, of the angle BD, which is the complement of twice ZQ: because $BOC = 2ZCQ$. Now $IA = 2GA, = 2OA \cdot \text{sin.} 2MQ = PC \cdot \text{sin.} 2MQ, = M \cdot \text{sin.} 2 \text{ decl.}$ Therefore the difference of the superior and inferior tides is $M \cdot \text{sin.} 2 \text{ declin. sin.} 2 \text{ lat.}$

5. If the colatitude be equal to the declination, or less than it, there will be no inferior tide, or no superior tide, according as the latitude of the place and declination of the moon are of the same or opposite names.

For when $PZ = MQ$, D coincides with I, and IK vanishes. When PZ is less than MQ, the point D is between C and I, and the point Z never passes through the equator of the watery spheroid; and the low water of its only tide is really the summit of the inferior tide.

6. At the pole there is no daily tide: but there are two monthly tides = $M \cdot \text{sin.}^2 \text{ declin.}$ and it is low water when the moon is in the equator.

7. The medium tide, represented by DH, is = $M \times \frac{1 + \text{cof.} 2 \text{ lat.} \times \text{cof.} 2 \text{ declin.}}{2}$. For $DH = DO + OH$.

Now OH is equal to $OG \times \text{cof.} GOH = OG \cdot \text{cof.} 2 ZQ$. And $OG = OA \cdot \text{cof.} GOA, = OA \cdot \text{cof.} 2 MQ$. Therefore $OH = OA \cdot \text{cof.} 2 ZQ \cdot \text{cof.} 2 MQ$. Therefore $DH = OA + OA \cdot \text{cof.} 2 ZQ \cdot \text{cof.} 2 MQ = M \times \frac{1 + \text{cof.} 2 ZQ \cdot \text{cof.} 2 MQ}{2}$. Let this for the future

be called m.

N. B. The moon's declination never exceeds 30°. Therefore $\text{cof.} 2 MQ$ is always a positive quantity, and never less than $\frac{1}{2}$, which is the cosine of 60°. While the latitude is less than 45°, $\text{cof.} 2 \text{ lat.}$ is also a positive quantity. When it is precisely 45° the cosine of its double is 0; and when it is greater than 45, the cosine of its double is negative. Hence we see,

1. That the medium tides are equally affected by the northern and southern declinations of the moon.

2. If the latitude of the place is 45°, the medium tide is always $\frac{1}{2} M$. This is the reason why the tides along the coasts of France and Spain are so little affected by the declination of the moon.

3. If the latitude is less than 45°, the mean tides increase as the moon's declination diminishes. The contrary happens if ZQ is greater than 45°. For DH increases or diminishes while the point G separates from C according as the angle COD is greater or less than COB; that is, according as PCZ is greater or less than ZCQ.

4. When Z is in the equator, H coincides with G, and the effect of the moon's declination on the height of the tides is the most sensible. The mean tide is then = $M \cdot \frac{1 + \text{cof.} 2 MQ}{2}$.

All that we have now said may be said of the solar tide, putting S in place of M.

Also the same things hold true of spring tides, putting M + S in place of M.

But,

M. H. C. H. A.

But in order to ascertain the effects of declination and latitude on other tides, we must make a much more complicated construction, even tho' we suppose both luminaries in the ecliptic. For in this case the two depressed poles of the watery spheroid are not in the poles of the earth; and therefore the sections of the ocean, made by meridians, are by no means ellipses.

In a neap tide, the moon is vertical at B (fig. 7. or 8.), and the sun at some point of fF , 90° from B. If O be this point, the construction for the heights of the tides may be made by adding to both the superior and inferior tides for any point D, the quantity $\frac{M + S - DF \text{ or } DK \times \sin^2 dO}{M + S - \text{tide}} \times \frac{\sin^2 2Q}{\cos^2 MQ}$, as is evident.

But if the sun be vertical at d , d will be the highest part of the circle fOF , and no correction is necessary. But in this case the circle of high water will be inclined to the meridian in an angle equal to dBO (fig. 7.), and neither the times nor elevations of high water will be properly ascertained, and the error in time may be considerable in high latitudes.

The inaccuracies are not so great in intermediate tides, and respect chiefly the time of high water and the height of low water.

The exact computation is very tedious and peculiar, so that it is hardly possible to give any account of a regular progress of phenomena; and all we can do is, to ascertain the precise heights of detached points. For which reasons, we must content ourselves with the construction already given. It is the exact geometrical expression of Bernoulli's analysis, and its consequences now related contain all that he has investigated. We may accommodate it very nearly to the real state of things, by supposing PC equal, not to CO of fig. 4. but to MS, exhibiting the whole compound tide. And the point B, instead of representing the moon's place, must represent the place of high water,

Thus have we obtained a general, though not very accurate, view of the phenomena which must take place in different latitudes and in different declinations of the sun and moon, provided that the physical theory which determines the form and position of the watery spheroid be just. We have only to compute, by a very simple process of spherical trigonometry, the place of the pole of this spheroid. The second construction, in fig. 8. shows us all the circumstances of the time and height of high water at any point. It will be recollected, that in computing this place of the pole, the anticipation of 20 degrees, arising from the inertia of the waters, must be attended to.

Were we to institute a comparison of this theory with observation, without farther consideration, we should still find it unfavourable, partly in respect of the heights of the tides, and more remarkably in respect of the time of low water. We must again consider the effects of the inertia of the waters, and recollect, that a regular theoretical tide differs very little in its progress from the motion of a wave. Even along the free ocean, its motion much resembles that of any other wave. All waves are propagated by an oscillatory motion of the waters, precisely similar to that of a pendulum. It is well known, that if a pendulum receive a small impulse in the time of every descent, its vibrations may be increased to infinity. Did the successive actions of the sun or moon just keep time with the natural propagation of the tides, or the natural oscillations of the waters, the tides would also augment to infinity: But there is an infinite odds against this exact adjustment. It is much more probable that the action of to-day interrupts or checks the oscillation produced by yesterday's action, and that the motion which we perceive in this day's tide is what remains,

and is compounded with the action of to-day. This being the case, we should expect that the nature of any tide will depend much on the nature of the preceding tide. Therefore we should expect that the superior and inferior tides of the same day will be more nearly equal than the theory determines. The whole course of observation confirms this. In latitude 45° , the superior and inferior tides of one day may differ in the proportion of $2\frac{1}{2}$ to 1, and the tides corresponding to the greatest and least declinations of the moon may differ nearly as much. But the difference of the superior and inferior tides, as they occur in the list of Observations at Rochefort, is not the third part of this, and the changes made by the moon's declination is not above one-half. Therefore we shall come much nearer the true measure of a spring tide, by taking the arithmetical mean, than by taking either the superior or inferior.

We should expect less deviation from the theory in the gradual diminution of the tides from spring tide to neap tide, and in the gradual changes of the medium tide by the declination of the moon; because the successive changes are very small; and when they change in kind, that is, diminish after having for some time augmented, the change is by insensible degrees. This is most accurately confirmed by observation. The vast collection made by Cassini of the Observations at Brest being examined by Bernoulli, and the medium of the two tides in one day being taken for the tide of that day, he found such an agreement between the progression of these medium tides and the progression of the lines MS of fig. 4. that the one seemed to be calculated by the other. He found no less agreement in the changes of the medium tides by the moon's declination.

In like manner, the changes produced by the different distances of the moon from the earth, were found abundantly conformable to the theory, although not so exact as the other. This difference or inferiority is easily accounted for: When the moon changes in her mean distance, one of the neap tides is uncommonly small, and therefore the successive diminutions are very great, and one tide sensibly affects another. The same circumstance operates when the changes in apogee, by reason of a very large spring tide. And the changes corresponding both to the sun's distance from the earth and his declination agreed almost exactly.

All these things considered together, we have abundant reason to conclude, that not only the theory itself is just in principle (a thing which no intelligent naturalist can doubt), but also that the data which are assumed in the application are properly chosen; that is, that the proportion of 2 to 5 is very nearly the true proportion of the mean solar and lunar forces. If we now compute the medium tide for any place in succession, from spring tide to neap tide, and still more, if we compute the series of times of their occurrence, we shall find as great an agreement as can be desired. Not but that there are many irregularities; but these are evidently so anomalous, that we can ascribe them to nothing but circumstances which are purely local.

This general rule of computation must be formed in the following manner:

The spring tide, according to theory, being called A, and the neap tide B, recollect that the spring tide, according to the regular theory, is measured by $M + S$. Recollect also, that when the lunar tide only is considered, the superior spring tide is $M \times \sin^2 ZM$ (fig. 8). But when we consider the action of two adjoining tides on each other, we find it safer to take the medium of the superior and inferior tides for the measure; and this is $M \times \frac{1 + \cos^2 2ZQ \times \cos^2 2MQ}{2}$. Let this be called m . This

Tide. being totally the effect of M as modified by latitude and declination, may be taken as its proper measure, by which we are to calculate the other tides of the monthly series from spring tide to neap tide.

In like manner, we must compute a value for S, as modified by declination and latitude; call this *s*. Then say,

$$M + S : A = m + s : A \times \frac{m + s}{M + S}.$$

This fourth proportional will give the spring tide as modified for the given declination of the luminaries, and the latitude of the place.

Now recollect, that the medium tide, when the luminaries are in the equator, is $A \times \text{cof.}^2 \text{ lat.}$ Therefore let F be the spring tide *observed* at any place when the luminaries are in the equator; and let this be the medium of a great many observations made in these circumstances. This gives $A \cdot \text{cof.}^2 \text{ lat.}$ (as modified by the peculiar circumstances of the place) = F. Therefore the fourth proportional now given changes to $F \times \frac{m + s}{M + S \cdot \text{cof.}^2 \text{ lat.}}$ And

a similar substitute for B is $G \times \frac{m - s}{M - S \cdot \text{cof.}^2 \text{ lat.}}$

Lastly, To accommodate our formulæ to every distance of the earth from the sun and moon, let D and Δ be the mean distances of the sun and moon, and *d* and δ their distances at the given time; and then the two substitutes become

$$\frac{\Delta^3 d^3 M + \delta^3 D^3 S}{d^3 \delta^3 (M + S)} \times F \times \frac{m + s}{(M + S) \text{cof.}^2 \text{ lat.}}$$

$$\frac{\Delta^3 d^3 M - \delta^3 D^3 S}{d^3 \delta^3 (M - S)} \times G \times \frac{m - s}{(M - S) \text{cof.}^2 \text{ lat.}}$$

The half sum of these two quantities will be the MC, and their half difference will be the SC, of fig. 4. with which we may now operate, in order to find the tide for any other day of the menstrual series, by means of the elongation *a* of the moon from the sun; that is, we must say MC + CS :

MC - CS = tan. *a* : tan. *b*; then $x = \frac{a + b}{2}$, and $y = \frac{a - b}{2}$. And MS, the height of the tide, is $MC \times \text{cof. } 2y + CS \times \text{cof. } 2x$.

Such is the general theory of the tides, deduced from the principle of universal gravitation, and adjusted to that proportion of the solar and lunar forces which is most consistent with other celestial phenomena. The comparison of the greatest and least daily retardations of the tides was with great judgment preferred to the proportion of spring and neap tides, selected by Sir Isaac Newton for this purpose. This proportion must depend on many local circumstances. When a wave or tide comes to the mouths of two rivers, and sends a tide up each, and another tide of half the magnitude comes a fortnight after; the proportion of tides sent up to any given places of these rivers may be extremely different. Nay, the proportion of tides sent up to two distant places of the same river can hardly be the same; nor are they the same in any river that we know. It can be demonstrated, in the strictest manner, that the farther we go up the river, where the declivity is greater, the neap tide will be smaller in proportion to the spring tide. But it does not appear that the time of succession of the different tides will be much affected by local circumstances. The tide of the second day of the moon being very little less than that of the first, will be nearly as much retarded, and the intervals between their arrivals cannot be very different from the real intervals of the undisturbed tides; accordingly, the succession of the highest to the highest but one is

Tide. found to be the same in all places, when not disturbed by different winds. In like manner, the succession of the lowest and the lowest but one is found equally invariable; and the highest and the lowest tides observed in any place *must* be accounted the spring and neap tides of that place, whether they happen on the day of full and half moon or not. Nay, we can see here the explanation of a general deviation of the theory which we formerly noticed. A low tide, being less able to overcome obstructions, will be sooner stopped, and the neap tides should happen a little earlier than by the undisturbed theory.

With all these corrections, the theory now delivered will be found to correspond, with observation, with all the exactness that we can reasonably expect. We had an opportunity of comparing it with the phenomena in a place where they are very singular, viz. in the harbour of Bifstedt in Iceland. The equator of the watery spheroid frequently passes through the neighbourhood of this place, in a variety of positions with respect to its parallel of diurnal revolution, and the differences of superior and inferior tides are most remarkable and various. We found a wonderful conformity to the most diversified circumstances of the theory.

There is a period of 18 years, respecting the tides in Iceland, taken notice of by the ancient Saxons; but it is not distinctly described. Now this is the period of the moon's nodes, and of the greatest and least inclination of her orbit to the equator. It is therefore the period of the positions of the equator of the tides which ranges round this island, and very sensibly affects them.

Hitherto we have supposed the tides to be formed on an ocean completely covering the earth. Let us see how those may be determined which happen in a small and confined sea, such as the Caspian or the Black Sea. The determination in this case is very simple. As no supply of water is supposed to come into the basin, it is susceptible of a tide only by sinking at one end and rising at the other. This may be illustrated by fig. 6. where C *s*, C *y*, are two perpendicular planes bounding a small portion of the natural ocean. The water will sink at *z* and rise at *x*, and form a surface *otr* parallel to the equilibrated surface *y s*. It is evident that there will be high water, or the greatest possible rise at *r*, when the basin comes to that position where the tangent is most of all inclined to the diameter. This will be when the angle *tCB* is 45° nearly, and therefore three lunar hours after the moon's southing; at the same time, it will be low water at the other end. It is plain that the rise and fall must be exceedingly small, and that there will be no change in the middle. The tides of this kind in the Caspian Sea, in latitude 45°, whose extent in longitude does not exceed eight degrees, are not above seven inches; a quantity so small, that a slight breeze of wind is sufficient to check it, and even to produce a rise of the waters in the opposite direction. We have not met with any accounts of a tide being observed in this sea.

It should be much greater, though still very small, in the Mediterranean Sea. Accordingly, tides are observed there, but still more remarkably in the Adriatic, for a reason which will be given by and by. We do not know that tides have been observed in the great lakes of North America. These tides, though small, should be very regular.

Should there be another great basin in the neighbourhood of *z x*, lying east or west of it, we should observe a curious phenomenon. It would be low water on one side of the shore *z* when it is high water on the other side of this partition. If the tides in the Euxine and Caspian Seas, or in the American lakes which are near each other, could be observed, this phenomenon should appear, and would be one of the prettiest examples of universal gravitation that can

be conceived. Something like it is to be seen at Gibraltar. It is high water on the east side of the rock about 10 o'clock at full and change, and it is high water on the west side, not a mile distant, at 12. This difference is perhaps the chief cause of the singular current which is observed in the Straits mouth. There are three currents observed at the same time, which change their directions every 12 hours. The small tide of the Mediterranean proceeds along the Barbary shore, which is very uniform all the way from Egypt, with tolerable regularity. But along the northern side, where it is greatly obstructed by Italy, the islands, and the east coast of Spain, it sets very irregularly; and the perceptible high water on the Spanish coast differs four hours from that of the southern coast. Thus it happens, that one tide ranges round Europa point, and another along the shore near Ceuta, and there is a third current in the middle different from both. Its general direction is from the Atlantic Ocean into the Mediterranean Sea, but it sometimes comes out when the ebb tide in the Atlantic is considerable.

Suppose the moon over the middle of the Mediterranean. The surface of the sea will be level, and it will be half tide at both ends, and therefore within the Straits of Gibraltar. But without the Straits it is within half an hour of high water. Therefore there will be a current setting in from the Atlantic. About three and an half hours after, it is high water within and half ebb without. The current now sets out from the Mediterranean. Three hours later, it is low water without the Straits and half ebb within; therefore the current has been setting out all this while. Three hours later, it is half flood without the Straits and low water within, and the current is again setting in, &c.
